MEDICAL RELATIONS*

By J D OLIN, MD, WATERTOWN, N Y

HE remarks of your retiring president will relate to three main propositions

1 The object of our profession is the promotion of human life and health, individual and public—no more—no less

2 The keystone of the profession is the gen-

eral practitioner

3 For the attainment of our aim not only is internal harmony necessary but co-operation with the manifold agencies which are our potential allies

The First Proposition The doctor measures his success by what he has accomplished for his patients and the cause of the conquest of physical The quack measures his success by the amount of money he has collected Then why the remark not infrequently heard—"I did so many hundred dollars business last month" "Business"—Very important to collect our fees We fail to get a good many we have earned We need the money, many of us Moreover, ability and hard work deserve proportionate reward But aren't we occasionally measuring values by the quack's standard? Are we really immune to the lure of "easy money"? Commercialism is a real danger, it would take the heart out of medicine. It leads to chicanery in our ranks, and justly loses us the confidence of the public

Six practices may be named which have a tendency to debase medicine to a money getting

proposition

1 Fee-splitting, under whatever guise, trades on the misfortune of the patient "I'll do you the favor of letting you take care of this case if you will reward me by handing me part of the fee That's fair! The patient is mine He will go where I say Moreover, I have a good many more who will follow him" It isn't always as bad as that On the same principle is the trading of patients or the reference of a patient because of the fancied obligation of friendship to the doctor to whom he is referred. We call it loyalty to our friends and associates. A loyalty sometimes costly to the patient. It is our busi-

* President's address at the annual meeting of the Jefferson County Medical Society November 10 1927

ness to know where our patients can ger proper attention, and to do our best to procure it for them—the patient's choice to be respected so long as we guard him from incompetency and malpractice. Surely his interests should not be subordinated to our friendships, jealousies and piques. Personal attraction and professional estimates and professional estimates.

timation are not synonymous

- 2 Commercialized Treatment How frequently a physician is approached by an agent with the invitation to increase his office income by the installation of some special apparatus for the application of some new mode of therapy. That is the appeal, to "increase your office income" The benefit the patient gets is not the thing the agent emphasizes most, though of course this erudite layman will expatiate on that ad libitum if you question it A gastroenterologist of repute who lectured to us last spring told me that he knew of physicians' offices in New York which were fitted up with a half dozen tables (each having an individual connection with the drain) for colonic irrigations, which were an almost routine prescription for those offices who is consuming a great deal of time in treatment is out of just that much time for diagnosis, and the careful observation of a dozen or so cases a day in any man's office takes time. People should be taught to pay for thoughtful and intelligent diagnosis in proportion to what they pay for treatment Who's going to educate them if the physician runs mad over treatments to the neglect of diagnosis Ready-made treatments do not always fit
- 3 Profiting from the sale of drugs and apparatus
- 4 Maintaining a minimum price for a given service "Doctor, this patient is poor but would want to pay a nominal fee" "Well, I'll do it for nothing, but you know I can't come down on my price"
- 5 Getting all that the traffic will bear. This is easily combined with (4). Given a rich man get what you can, the poor can accept so called "charity" or nothing
 - 6 Underbidding It is natural for a patient

to want to know somewhere near what a procedure is going to cost, but we must be careful not to encourage "shopping"

The Second Proposition The keystone of the medical profession is the General Practitioner The properly equipped, high-minded general practitioner is worthy of the highest place in His is the opportunity for the the profession broadest view and the most thorough observa-Some time ago we heard it proposed to decrease the educational requirements of some of our general practitioners. Actually, the require-To lower them ments are still being raised would ruin the practice of medicine A way must be provided to make some fields more attractive, but it will rather be along the lines of increasing the facilities for scientific investigation and furnishing a better remuneration for services in the more sparsely settled sections The general practitioner's time is so interrupted that he is apt to neglect study unless his interest is stimulated by association with some institution of medical learning, but the recognition by medical societies of their educative function is going to do a good deal toward furthering postgraduate education and corresponding keenness and professional earnestness

More and more stress is being laid upon the fact that the Medical Profession must more fully recognize it's obligation as guardian of individual and public health. But, though in some quarters the profession has been active in promoting the periodic health examination, it's value is being advertised chiefly to the public so far by insurance companies. This very fact has served to prove its usefulness, statistics show that it pays the insurance companies.

Who is to make these examinations if not the general practitioner? To whom will John Smith go for the periodic health examination? Naturally, to the man who is wont to advise him in But how many have such a matters of health regular adviser-one in ten, perhaps? It is a As like as not, John Smith day of specialists consults Dr A for his "stomach", Dr B for his varicose veins, and he may happen in on Dr C for an attack of lumbago He is not anchored anywhere It is up to the medical profession to furnish him a proper mooring place and to see that he is tied up to it so long as it is a good anchorage and the storm prevails, and that he come back there often enough in calmer seas to know where it is Though the realization be distant, the ideal it seems to me that we should teach and preach is that each person, so far as may be, when he comes to years of independence, should choose his or her physician to whom, so long as the arrangement is mutually satisfactory, he shall go with every physical ailment requiring the attention of a physician—that he may expect that physician to take a personal interest in his wellbeing and keep an accurate, intelligible record of his bodily condition, the physician to examine him at periodic intervals and to advise him when need of consultation is felt, and the patient to feel free to suggest consultation at any time On removal of the patient to another location, or in case of the death or removal of the physician, or the patient's choosing to employ another, the record of the first physician should be available to the new consultant, and should be furnished as a routine on removal real medical cooperation In this plan the specialist comes in in his right place as a consultant, a temporary therapeutist, or operator When he has performed his function the record of his service, diagnostic operative and postoperative, or therapeutic should be delivered into the hands of the patient's physician and the patient instructed to report back to him That there are many obstacles in the way of the attainment of this idea I admit, not the least of which are our own weaknesses, but I do not believe those obstacles are insurmountable This condition already exists in many instances, and why should it not be worth striving for as a general custom?

Consider some of the obstacles One is the appropriation of patients When a patient has been referred to a specialist, if the indications have been well met and the patient restored to health, something dramatic has been accomplished. It is natural for the patient to feel great confidence in the man who has done so much for It is natural for him to consult this man about other things. He is likely to quiz him on matters concerning which he has already gotten his own physician's opinion, and to come to his office for other ailments It is easy for the specialist, without perhaps meaning to do so, to become the office practitioner for this patient, yes and even for his family This is not, however, for the best interests of the patients, though it may seem to the specialist to be so in individual The specialist is not going to attend these patients in their homes, and moreover he does not often have time to give proper general care in his office

There is also lack of cooperation on the other side. The general practitioner attempts work which has come to belong to the specialist be cause he is the man who is best qualified to handle it successfully. Just where the work of or ends and that of the other begins is often discult to decide, but, as a general proposition, there is no need for confusion. Any disagreement as to where the line runs might be verproperly thrashed out in the medical society, and a proper spirit of cooperation will take care of the borderline.

Then, not infrequently the specialist will fin some one sitting in the waiting room who has no appointment, though he may have come considerable distance. The only introduce is "Dr So and So sent me in to see you situation is embarrassing—no information."

the referring physician, and no opportunity for a proper examination at the time of the visit, though the patient is miles from home. your permission I will read from Principles of Medical Ethics of the A M A, Chapter 2, Section 4. Article 3

"PATIENT REFERRED TO SPECIALIST

"When a patient is sent to one specially skilled in the care of the condition from which he is thought to be suffering, and for any reason it is impracticable for the physician in charge of the case to accompany the patient, the physician in charge should send to the consultant by mail, or in the care of the patient under seal, a history of the case, together with the physician's opinion and an outline of the treatment, or so much of this as may possibly be of service to the consultant, and as soon as possible after the case has been seen and studied, the consultant should address the physician in charge and advise him of the results of the consultant's investigation of the case Both these opinions are confidential and must be so regarded by the consultant and by the physician in charge

The American College of Surgeons has done a splendid service in the standardization of hos-The hospital staff meeting has given an opportunity for regular clinical conferences of which the potential educative and stimulative value is very great. In our local hospitals, organization has hitherto consumed a large part of the time allotted to staff meetings, but it will not be long before practically the whole of the time will be devoted to clinical discussions and the review of the work of the various departments Not the least of the benefits to be derived from these staff conferences are the interchange of opinions and the friendly criticism which makes in the end for cooperation and better work the hospital conference, one catches the spirit of the open mind, the loosening of prejudice in the search for fact while the concrete case makes a vital focus for the discussion of experience and The physician may benefit by the opinion of his confreres on any question that is vexing him in the handling of any of his cases - local hospitals are organized on the open staff plan, so that all physicians of repute within the radius of the hospital's activities may make application for staff membership and the use of the ospital for the care of their patients One of them, in it's newly adopted bylaws for the staff, makes membership in good standing in one's county society a requisite for staff membership, and it is probable that in the near future the other will do the same. Though the burden of the routine work of the hospital staff naturally falls on a few of the local men, all other staff members, no matter how little they may use the Count 'tal, should avail themselves of the monthly

meetings and contribute their share to the incal conferences The ultimate success of these staff conferences, as well as of the activities of this society depends of course upon the recognition of individual responsibility

The past three years have seen an awakening of this society in the matter of the practical application of it's educative function. One of our members has been especially active as a pioneer in this movement, and his work has merited more than local recognition. Chiefly through his efforts this society has taken a leading place in the promotion of postgraduate instruction through the medium of the county society

The Third Proposition The necessity of cooperation with allied agencies I believe, as suggested by the President of the State Society, we should have a Public Relations Committee with the broad scope of getting in touch with various organizations and movements aiming at health activities in the broadest sense of the term, so that we may guide and direct them

The medical profession should encourage and To this end we foster the study of pharmacy should be considerate of our druggists. It is a question how many drugs we should put on our I have mentioned the selling of drugs for profit We certainly should not compete with the drug stores

Dentistry is the natural ally of medicine Let us be quick to give our dentists credit for the excellent work being done in their profession, whose program has been so radically changed by the recognition of the evils of oral and alveolar infection. Cooperation should displace dictation It will do us good to go a bit out of our way to consult with the dentist, and we may learn something in so doing

Our attitude to the nurse should be one of cooperation and direction, not of overlordship Rebuke in the presence of a patient is unfair and is destructive of the relationship which should be maintained. A private interview will be far more apt to get the results we seek, and will avoid the danger of injustice. Let us not forget that in the hospital the discipline of the nurse is in the hands of the superintendent of nurses and the superintendent of the hospital

Following an insistant demand by the medical profession the nurses of our community in the fall of 1922 established a nurses' registry have been very earnest in this and their conduct of it has evidenced from the first the motive of service to the patient and physician board of directors are three physicians, one of whom must be the president of this society know of a good deal of self-sacrificing effort that has been put into this undertaking by nurses who had no individual benefit to derive from it except relief from the burden of securing nurses Nurses' Registry should have not only our support but our commendation Let us remember that the profession of nursing is indispensible to us and has an ideal as high as our own

Let us recognize our dependence on the laboratory worker, and other technicians and meet them in a spirit cognizant of mutual helpfulness. And so of all the many others who contribute to this great task, from the public health worker down to the most menial of hospital employees are all necessary to each other—each has his worthy part

As we become closer associated, as we more and more realize our individual responsibilities to the public, to our own society and to each other, our power for accomplishing the objects of medicine becomes ever greater. Let us get the broad view, and do our bit so that our profession may carry on Competition may be the life of trade, but cooperation is the life of the patient

THE VALUE OF SCOTOMETRY IN THE DIAGNOSIS AND TREATMENT OF **GLAUCOMA***

By A, H THOMASSON, MD, NEW YORK, N Y

COTOMETRY is probably the most important aid to the early diagnosis of glaucoma at our command It enables us to discover an almost infallible sign of this disease long before demonstrable structural changes have taken place, and before any subjective symptoms are constantly present. The importance of an early diagnosis becomes manifest when we consider that unless such a diagnosis is made irreparable damage will be done, the tension will be controlled with much greater difficulty, and almost certainly an operation must be resorted to eventually to preserve whatever vision may remain after repeated attacks of high tension tunately, however, an early diagnosis is difficult if we rely upon the symptoms on which a diagnosis is usually based, for many of these symptoms are not constantly present during

this early stage

The symptoms of glaucoma are dependent, with possibly one exception (the adrenalin pupillary reaction), upon increased intraocular pressure, and late in the disease they are constant because they are then dependent upon anatomic changs in the eye that have been produced by the increased intraocular tension, and because at this stage of the disease the tension is usually constantly elevated Early in the disease, however, before such changes cupping, demonstrable optic atrophy, atrophy of the iris, shallow anterior chamber, etc, have taken place, the ordinary symptoms such as venous congestion, steaminess of the cornea, halos, foggy vision, contraction of the visual field, etc, will only be present during a rise of the intraocular pressure But during this stage of the disease the tension is not constantly above the normal In fact, at this time there are frequent, and often fairly long periods during which the tension is perfectly normal, and during which also there are no subjective symptoms. But a diagnosis must be made during this period in every possible case in

order to prevent pathological changes that are so destructive to sight, and that are responsible for practically all the complications that we encounter in our management of this disease To defer a diagnosis in a case of glaucoma until obvious structural changes are present would be as inexcusable as it would be in the case of pulmonary tuberculosis to wait for obvious cavity formation and for the appearance of tubercle bacilli in the sputum before making a diagnosis Each disease must be diagnosed in its incipient stage if we wish to prevent irreparable damage, and thus render to our patients the service they have a right

to expect from us

The great difficulty in the diagnosis of incipient glaucoma is that the patient may, and often does, present himself for examination during a quiescent period, when practically no Such a patient will symptoms are present offer little in the way of history that is of value, and if our examination reveals an eye that is apparently normal we are apt to pass the case by without resorting to the tests that would enable us to make a diagnosis us assume that such a patient comes to us for an examination As has been stated, the history is usually unimportant. He is convinced that his sight is getting worse, and has made repeated attempts to improve it by a change of glasses If closely quizzed concerning fogg vision a certain percentage will recall such attacks, but the majority will not have notice even this symptom. We proceed with ou examination and find that the corrected cer tral vision is normal. The field of vision taken with a standard perimeter at 33 rm and using a 5 mm object, is normal We no examine the blind spots, using one of th short radius campimeters and a somewhat smaller test object, but they are normal The tension is normal. The pupils are of nort size and react to light This reaction may somewhat sluggish, but this defect is easil overlooked in an otherwise apparently norma eye There is no cupping that can be made our

^{*}Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls N Y May 11 1927

by the average examiner and no optic atrophy can be made out. Have we not then done all that can be reasonably expected of us, and are we not justified in quieting our patient's fears and assuring him that his eyes are normal? Assuredly not, for we have neglected the two important tests that would have enabled us to make at least a tentative diagnosis of glaucoma, and we could then have placed the patient under observation until a definite diagnosis could be established. These two tests are The examination of the blind spot for Bjerrum's scotoma, and the determination of the pupillary reaction to adrenalin econd of these I shall not discuss in this p er, but Bjerrum's sign, although not absolurely pathognomonic of glaucoma yet, because it appears at the very onset of the disrase, does not disappear during periods of ormal tension, is so constantly present when glaucoma is present and absent in non-glaucomatous conditions, becomes the one outstanding sign of value during the early stages of this disease. I have never seen it absent in any early case of glaucoma, and have seen but one enlarged blind spot in a non-glaucomatous case that could have been mistaken for Bjerrum's sign, and this case did not bear the slightest resemblance to glaucoma in any other respect The examination, then, of every suspected case of glaucoma must include a search for this sign, for when present it enables us to confirm a diagnosis of glaucoma in the absence of other definite symptoms, and when absent, it enables us to rule out such a diagnosis even in the presence of certain more or less definite symptoms, such as a large and unusual appearing physiological cup in a hysterical patient with a contracted field

But Bjerrum's sign, when it first appears, can only be detected by Bjerrum's original method of scotometry, by means of a tangent screen, or some substitute for a tangent screen, it a distance of one meter or more, and by using test objects measuring from 1/16° to %° That is, a 1 mm or a 2 mm object, if ised at a distance of one meter This fact has een repeatedly demonstrated by me, and in his paper the term "scotometry" has refernce to Bjerrum's method of scotometry The easons for using small test objects at a dis--1 nce of at least one meter have been fully set orfa in a previous paper* This method of Azmination, then, becomes a necessary procedure in every attempt at the early diagnosis of glaucoma When Bjerrum's sign has once been demonstrated, we should seek a confirmaof our diagnosis by determining the renalin pupillary reaction and by frequent

testing of the intraocular tension, as well as by repeated examinations of the blind spot to determine whether there is any advance in the scotoma. By following some such procedure as this many cases of early glaucoma will be diagnosed that are now being overlooked, and when once the importance of scotometry has has been learned, it will never be abandoned

But scotometry is not only of value in the diagnosis of glaucoma. It is equally valuable as a means by which to determine the future progress of this disease, and as a guide to treatment. And this is true not only during the early stage, but throughout the entire course of the disease When once Bierrum's scotoma has been accurately outlined, if the treatment that is instituted, whether operative or miotic, is sufficient to keep the tension within normal limits at all times, there will be no change in the scotoma due to an advancement in the glaucomatous process a normal tension has been gained by means of an operation, the scotoma will usually not advance, but when a normal tension is apparently maintained by means of drops, there will usually be a steady advance in the scotoma This seems to indicate that we cannot be sure of maintaining a normal tension by means of In cases treated by this method there inust, at times, be elevations of the tension of which we are not aware. But no matter what the method of treatment, we must keep ourselves informed at all times as to the progress of the disease For this information we cannot rely entirely upon frequent determinations of the tension, for there are fluctuations of tension that occur in the interim between office visits, concerning which we can have no knowledge, and which steadily advance the glaucomatous process in spite of an apparently normal tension. The same may be said concerning field taking by the ordinary The usual instruments for field taking do not reveal slight gains and losses in the visual field,—gains and losses that mean much in determining the dosage if a patient is to be kept on drops, also whether an operation is to be resorted to, and if so, when to But scotometry gives us this inforoperate mation more quickly and more accurately than any other method of examination It is, therefore, supplemented of course by other methods of diagnosis, the most reliable guide that we have as to the progress of this disease, and in the determination of the treatment. For this reason the scotometer becomes a necessary part of our office equipment if we treat glaucoma at all for the physician who does not use it cannot obtain all the information concerning his patient that he should possess, and therefore places both himself and his patient at a disadvantage

^{*}A Simplified Tangent Screen with Suggestions on Field Taking A. H Thomasson, Archives of Ophthal, vol. lv, No 6, 1926

PLASTIC AND RECONSTRUCTIVE PROCEDURES IN RHINOLOGY*

By JACQUES W MALINIAK, MD., NEW YORK, N Y

THE object of this paper is to bring out some new points in the application of reconstructive surgery in rhinology. I shall confine myself at this time particularly to that field of rhinoplasty, the principal aim of which is the rebuilding of the intranasal structure with the restoration of their function. The plastic procedures in atrophic rhinitis, in nasal atresias, and in drainage of the lachrymal sac, are of great interest because no surgical method as yet seems to be universally accepted.

Before taking up in detail the subject under consideration, I wish to state briefly the fundamental principles of epithelial grafting which has numerous indications in this work

OLLIER-THIERSCH GRAFTS

Epithelial grafting has gained an enormous importance in reconstructive surgery on account of the certainty of its "taking" As far back as 1872, Reverdin successfully applied small fragments of epidermis to granulating wounds Later, the necessity of covering extensive skin defects brought about the use of the large epidermal grafts introduced by Ollier and Thiersch taking of the graft depends on the primary adhesion of the transplant to the wound, which may be prevented by the accumulation of serum or blood between them In a region with loose skin, —as the neck, cheeks, eyelids, etc, the epidermal graft becomes folded, due to a certain retraction of the bed of the wound This should be taken into consideration from a cosmetic point of view Since the perfection of the technic in the application of full thickness grafts and pedunculated skin flaps, these two have in most cases, for cosmetic and functional reasons, replaced the Thiersch graft, especially in the region of the

In the nasal cavities, this method of epidermatization has numerous indications on account of the simplicity of execution and the certainty of The cosmetic side is not important here, providing a nasal lining in luetic deformities by this procedure has completely revolutionized the operative results obtained in these cases method has also changed the prognosis in congenital and acquired stressas of the nasal cavity Grafting the antra is indicated where epithelization of the cavity by a flap of nasal mucosa is impossible,—as in the operative technic for ozena, where the inferior meatus is narrowed by a submucous transplant of cartilage and no flap is In the Caldwell-Luc operation the preparation of a large flap of nasal mucosa placed on the floor of the maxillary sinus is sufficient in the majority of cases

*Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls N Y, May 11 1927 Technic — The important points in the technic are the following

(1) The epidermal graft should be as thin as

possible

(2) All scar tissue and granulations must be thoroughly removed from the woundy surface

(3) Complete hemostasis

(4) Uniform compressive dressing, maintaining the graft in place and also promoting hemostasis

Mucous membrane can be successfully replaced by epidermal grafts or by pedunculated thin skin grafts, which slowly assume the characteristics of a mucous membrane. Pedunculated flaps of nasal or buccal mucous membrane are indicated in many instances in order to cover wound surfaces in the nose and mouth and to protect natural and post-operative outlets from closure. In forming endonasal flaps great care must be exercised in preparing the base through which the blood supply is provided.

Free Transplants, which we use very largely in this field, are of cartilage and of fat. The advantages of using cartilaginous material has already been emphasized ¹ Its tendency to bend is utilized in fitting the graft into the curvature of the inferior meatus and the nasal floor during intranasal rhinoplasty. It is also an ideal transplant for the correction of nasal deformities and for defects of the cranial and facial bony framework.

Fat transplants have to be handled with the utmost care As some absorption of the fat occurs with time, overcorrection of the defect must be made The use of fatty tissue, together with the fascia, is supposed to give a more uniform surface.

EXTERNAL RHINOPLASTY

Much has been written in the past few years on this line, and the medical opinion seems now to be aware of the importance of this newly developed branch of surgery

Without entering into the details of technic in these deformities, as they were described by me in previous papers,^{2 s} I should like only to summarize here some fundamental requirements in corrective rhinoplasty

(1) Artistic inclination which can, to a certain degree, be cultivated

(2) Good rhinological and rhinoplastic train-

ıng

(3) Thorough antiseptic preparation of the operative field

(4) External incisions should be used in cases of chronic involvment of the nasal cavities

(5) The modelling of the nose has to be done

with extreme carefulness, attention should be paid to the details which are responsible for the ultimate cosmetic result. The effects of the intranasal incisions and the late retraction of scars, have to be calculated during the intervention

(6) Stereoscopic photographs and plaster of Paris casts, made before and after the operation, are necessary requirements for preliminary study and also as valuable records

INTERNAL RHINOPLASTY

Atrophic Rhinitis, With or Without Ozena— Leaving aside the pathological and clinical considerations of these affections, I wish to describe here a procedure which seems to me most rational for the narrowing of the nasal cavities

The excessive width of the cavities favors the evaporation of nasal secretions and, to a certain degree, the formation of crusts with or without odor, depending upon the nature of the affection. The ethmoids and the maxillary sinuses, more or less involved in both cases, have to be dealt with according to the condition present. In ozena the pathological factors still under question have to be taken into consideration. In post-operative atrophic rhimitis, which one finds after a radical operation on the turbinates and ethmoids he pathology is entirely mechanical.

OPERATIVE TECHNIC

The first idea of remodelling the nasal cavities dates from 1902, when Moure and Brindel conceived the idea of injecting paraffin into the turbinates. This had to be abandoned because of the danger attached to its use and the technical difficulties. The two methods brought forward in recent years are as follows.

- (1) Narrowing the nasal cavities by mobilization of the lateral walls (a) by the buccal route (Lautenschlager, Hinsberg, Seiffert, Ramadier), (b) by the nasal route (Halle)
- (2) Narrowing of the nasal cavities by submucous transplantation

These methods have been described in numerous articles. I have also analyzed them elsewhere in connection with certain complications to which they give rise

(3) All these procedures consist of surgical treatment of concomitant chronic sinusitis and the narrowing of the nasal cavities. This last problem is purely a reconstructive one and should be studied from this point of view

After a series of cases of ozena which I had operated on by the modified Lautenschlager method, a communication was published by my former associate, describing my technic and the results obtained I have been able to follow these patients for some years and to present them to the ORL Society of Cincinnati in December, 1925 All the patients were to a great ex-

tent relieved of their symptoms. However, the bony transplants placed under the mucous membrane which seemed healthy and normal, were partly absorbed and the nasal cavities became larger than during the first months after the intervention. These findings accord entirely with my experience as to the permanence of bony transplants in general reconstruction. The cases operated on by the same procedure but with the use of cartilaginous transplants show a complete absence of absorption.

The technic which I have adopted after a prolonged control of operated cases I believe to be simple and ideal from the point of view of reconstructive art It is as follows

- (1) Each side of the nose is operated on separately under infiltration anesthesia, with four weeks' interval between
- (2) During the first intervention, costal cartilage is provided in sufficient quantity for both sides, and—between operations—the transplant is stored subcutaneously in the chest
- (3) Incisions are made in the gingivo-labial folds, as in a Denker operation, but extending anteriorly as far as the lateral incisors (Fig 1)

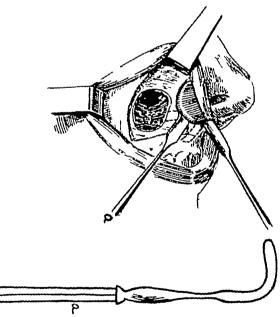

Fig 1 -- Nasal mucosa separated with an angular elevator in the region of the pyroform aperture.

- (4) Ethmoidectomy and antrum curettage are done when indicated The ostium in the naso-antral wall is enlarged and a small inucous membrane flap formed around its lower circumference and displaced into the antrum in order to protect the opening from closure (Fig. 3)
 - (5) Submucous transplantation of cartilage
 - (a) The nasal mucosa is exposed in the region

of the Pyriform aperture (Fig 1a) and with my special angular elevator (Fig 1b) the membrane

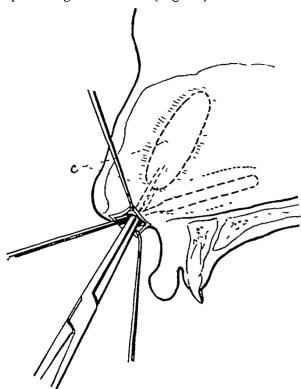

Fig 2—Two tunnels under the septal membrane where cartilaginous fragments are introduced

is carefully separated in the region of the inferior meatus and the nasal floor. Appropriately shaped cartilaginous fragments are introduced under the nasal mucous membrane which is raised to the desired extent. (Fig. 3b)

(b) Through the columella incision, the septal mucous membrane is separated on the corresponding side in such a way as to create two tunnels in which two cartilaginous grafts are introduced

(Fig 2c) By this operative step I complete the narrowing of the nasal cavities, especially in the middle and upper floors of the nose-impossible to accomplish by the external graft alone The lower septal transplant is placed parallel to the inferior turbinate, and the upper is directed upward and backward in front of the middle meatus and tur-(Fig 3c) The introduction of cartilage through the columellar incision eliminates the chances of infection through the nasal fossæ One series of six cases operated on by this method and still under observation shows results superior to those offered by the old method, especially from the point of view of complete and permanent narrowing of the nasal cavity

ATKESIA OF THE NASAL CAVITIES

in a certain number of affections the rhinologist has to deal with cicatricial tissue or congeni-

tal diaphragms which can be treated successfully only by intranasal plastic procedures. Removed by knife, by galvano-cautery, or by diathermy this tissue reproduces itself by proliferation of granulations and the only way to avoid scar formation is to cover the wound surface by a Thiersch graft or a pedunculated mucous membrane flap. This problem has a special importance in the air passages and should be treated with the utmost care

Classification—The atresias may be divided into traumatic, post-infectious, and congenital. If they are of traumatic origin (war wounds, burns, post-operative) or infections (syphilis, lupus, diphtheria, etc.) after the arrest of the inflammatory process, the cicatricial tissue should be excised and all the neighboring parts freed from their adhesions. The Thiersch graft, as already mentioned, should be applied under pressure on stent and maintained in place by means of a prosthetic apparatus fixed on a denture

The question of treatment of a laryngo-tracheal stenosis by this method remains open and offers a wide field of activity to laryngologists interested in plastic operations. I have frequently had occasion to see these cicatricial atresias in the nasal vestibule treated repeatedly by excision, with recurrence of scar tissue and reproduction of the deformity

Providing a lining in luetic nasal deformities after excision of the scarred mucous membrane and freeing of the nasal skin from all the deep adhesions should be a generally accepted procedure

The deepening of the gingivo-labial cul-de-sac obliterated by scar tissue is corrected by the same

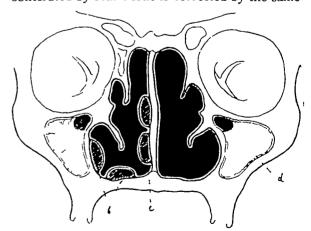

Fig 3—The position of the cartilaginous transplant in the narrowed nasal cavity

method, and was of tremendous importance in treating war wounds of the mouth

I pithelization of the maso frontal duct is uscful in the radical cure for frontal sinusitis, as the closure of the duct by scar formation compromises the result. To maintain the ventilation of the sinus by the maso frontal communication, it

is necessary to avoid granulation tissue of adjacent surface by providing a very thin Thiersch graft, rolled around a small caliber tube. I believe it to be the key to the success of the radical trontal sinus operation.

Intransal Tear-Sac Operation —This may be considered as a most typical reconstructive intervention, indicated in acquired malformations of the lacrimal duct for the re-establishment of its function and the improvement of external appearance. It was my privilege, many years ago, to follow this procedure, elaborated by West, at the Silex Clinic, and to observe the immediate and late results.

It is not my intention to enter here into a discussion of the pathology of the lachrymal apparatus nor the details of technic of the Polyak-West operation. The principle of the latter consists, as you know, in the formation of a window in the nasal mucosa and the underlying bone, corresponding to the lachrymal sac. The internal wall of the sac is resected and its content drained into the nasal cavity.

West's technic, as he uses it at the present time, after 1600 operations to his credit, presents the following details of great importance on which I believe the success of the operation depends

(1) The quadrangular flap is made in such a way as to denude the pyriform aperture and enlarge the field of operation

(2) The opening in the flap is made after the resection of the bony window and should cover carefully its edges to avoid closure by granulations

(3) The bony window and the resection of the internal wall should be made as wide as possible.

(4) In order to avoid the slipping of the flap with recurring obstruction of the canaliculæ,

it should be sutured on the lower incision. The flap is maintained in place by packing for six to seven days, and the sac is syringed daily

Conclusions

- (1) In a series of rhinological affections necessitating intervention of a plastic and reconstructive character, a cooperation of the rhinologist with the rhinoplastic surgeon becomes necessary
- (2) Corrective external rhinoplasty will be come popular, providing a rigorous operative technic is applied and the artistic side of the work is observed
- (3) In atrophic rhinitis, with or without ozena, the narrowing of the nasal cavities by a cartilaginous transplant into the septum and lateral walls presents the method of choice

(4) Cicatricial atresia in rhinology may be successfully treated only by Thiersch grafting

(5) The success of an intranasal tear-sac operation depends entirely on the appropriate building of a mucous membrane flap, the resection of a bony window, and wide opening of the sac, all typical procedures of internal rhinoplasty

SALPINGITIS A PLEA FOR DELAYED OPERATIVE INTERVENTION*

Deductions Based On a Survey of 600 Cases

By JAMES V RICCI, MD, NEW YORK, N Y

ITH a background of two decades and a half of clinical observations on the care of infected tubes, beginning with the epochal tubal extirpation by Coe, and including the varied experiences and views of a large number of gynecologists, Simpson, in 1915, enunciated before the American Gynecological Association four classical postulates on the treatment of the infected salpinges. These axioms, like the chiseled figures of a bas-relief, stand out to this day clear and incisive. He recognized the principle that the pelvis, unlike the upper abdo-

*Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls N Y May 11 1927. The author markes to express his thanks to Dr C B Bacon Superintendent of the City and Metropolitan Hospitals for per mission to remer the charts and to Dr E IV Pinkham enter of the gynecological service of the City Hospital

men, is endowed with considerable contrainfective activity, that surgical trauma, however minimal, seriously interferes with an inherent defense mechanism, that effective resistance and developmental immunity depend on one outstanding factor time Simpson stated in part that before operation "the patient shall have recovered from her last illness, and shall have regained a satisfactory margin of reserve strength, the temperature shall not have risen above normal a single time for a minimum period of three weeks" And though he admitted that this was an empirical rule he based it on the belief that it frequently requires at least three weeks of afebrile reaction following an acute attack, for the bacteria to become totally

In 1917, Polak reiterated these very principles, and, since then, has repeatedly stressed their significance and importance. And, further, he emphasized the necessity of a longer preoperative waiting period than the advocated three weeks, in cases of pelvic sepsis of a

destroyed, and the tissues to regain a normal state

streptococcic origin "Radical abdominal procedure should never be done in the presence of acute tubal infection, or in acute exacerbations of chronic inflammatory conditions. It takes time to sterilize the tubal contents—from six weeks to three months in gonorrheal infections, and longer when the streptococcus is the invading agent. The morning and evening temperatures must be normal for a period of at least

three weeks before intervention is considered"

In support of these views is the recent statistical report by Cherry on over 1,000 operated cases of salpingitis—the combined work of several gynecologists Of these cases, some were operated after a prolonged stage of chronicity, some, three to ten days after the last febrile reaction, and others in the midst of an attack He reports a mortality rate of 4 per cent in patients operated with a white cell count below 16,000, and one of 20 per cent in patients with a count above 16,000 Unfortunately, telling as these percentages may be, this classification into two groups above and below that demarcational leucocytic figure is somewhat ill-chosen For, on the basis that temand obscuring perature and leucocytosis run a parallel course in infections, the first series must contain both chronic and acute, or mildly acute, cases But, even so, the death rate is unnecessarily high, while the operative mortality in the second series is alarming. Any procedure that bears the stigma of so high a rate—a rate which, by the mere item of prolonging the pre-operative interval, can be appreciably reducedought to be instantly discarded

With these facts presenting, the writer surveyed the charts of 600 cases pingitis from the records of the City and Metropolitan Hospitals of New York observations gleaned therefrom, coupled with the author's clinical experience, formed the The study basis of the ensuing deductions was undertaken primarily to note the comparative incidence of mortality and morbidity in these cases of inflamed adnexa treated either expectantly or by surgical intervention tressing post-operative sequelae, manifested in the form of an immediate traumatic shock, septic death, prolonged post-operative febrile reaction, persistent drainage, and occasional secondary operation for an intractible sinus, had been repeatedly observed These incidents had occurred mainly in patients operated with a temperature, and, not infrequently, in patients operated after one to three weeks of afebrile rest Singularly enough, the non-gynecological surgeon is inclined to discount these complications, and consider them merely as unavoidable accidents, sequential to any surgical procedure, rather than definitely incidental to a premature operative treatment of salpingitis. This feeling, coupled with the relatively large percentage of recoveries, have made operators callously wink at the Simpson-Polak dictum—a dictum which ought to bear the sanctity of an immutable therapeutic law

Some surgeons hide behind the insistence that these cases of inflammatory adnexal masses cannot be treated collectively, nor can one subject them to one unyielding therapeutic rule Rather, they prefer to individualize, they prefer to weigh each case in the light of its own so-called inherent merits, making allowances for the strain of a prolonged attack and the patient's economic distress. This view on selection and individualization of cases for earlier operation belongs to the realm of pathetic fallacies, and is tantamount to a surgical But it is more than passing strange crime that the records of one institution prove that the largest death rate occurred in private cases a silent testimonial of the fact that, in reality, it is not always the economic distress of the patient that leads to a premature operation True, patients with pelvic masses, harboring organisms, may, from an economic point of view, be considered below par, but they are seldom totally incapacitated save during an acute exacerbation With the lapse of time, the intervals between the attacks increase, while the severity of each subsequent one diminishes To disregard the absolute necessity for the proper pre-operative waiting time on the basis of an economic argument, is inhumane logic and false economy

The author admits an occasional sudden rupture of a septic adnexal pus sac into the peritoneal cavity, or into a near-by viscus, producing (at times) a fatal issue, but this is a gynecological rarity If rupture does occur, immediate intervention—and that limited to a colpotomy—is essential, irrespective of temperature and leucocytosis At all events, a pelvic mass with an active inflammatory process which can injure and perforate an encapsulating wall, must harbor an extremely virulent strain of toxicity a factor all the more in favor of not interfering by abdominal route, to avoid the possible spreading of the infective agent to the upper abdominal areas

For the sake of portraying comparative values, the 600 cases in this series have been selected to conform to three definite groupings of 200 each

GROUP I

The first group includes the non-operated cases These patients were admitted to the

hospital with an active inflammatory tubal process as evidenced by the presence of pelvic pain, febrile reaction, and leucocytosis The admission temperature varied from 99° to the occasional one of 105°, with all the intervening gradations There was a corresponding elevation of pulse rate The severity of the pain likewise varied without relation to the size of the adnexal masses This group of cases was treated solely by rest, cold local applications, hot douches, and opiates With the cessation of the febrile course, the pelvic pain subsided, and, even though the adnexal pathology had not totally disappeared, there was a temporary arrest of the disease, and an interval of comparative comfort for the patient The interval between attacks may last weeks, months, and even However-apart from the not infrequent exceptions where the initial attacks of a gonococcal aetiology terminates the course of the disease, leaving an undisturbed pelvis save for the occasional adhesion—the majority of these cases await the advent of a recrudescence The tabulation given below shows the duration of the attack in the individual cases of this group

200 non-operated cases of ACUTE SALPINGITIS

MORTALITY				
Number of cases	Number of deaths			
200	٥ ر۷٤			

GROUP II

The second series consists of 200 operated cases that showed chronically inflamed tubes with no evidence of infective material, either microscopically or on histological section. The pathology was limited, on inspection, to closed fimbric extremities, nodosal distortions, adhesive reactions, and, on microscopic ex-

amination, to chronic cellular infiltration Plainly, this group includes all cases of

chronic salpingitis of a long standing course, wherein all infective material had been previously destroyed by the known processes of phagocytosis, autolysis, absorption, and cellu-Not all these patients went to lar reaction operation on account of symptoms referable to inflammatory tubal lesions. A goodly number presented other gynecological entities There occurred in this series one death due to a peritonitis of unknown origin, a mortality rate of one-half per cent Deaths due to other operative causes, such as embolic processes, intestinal injuries, cardiac failures, and ether pneumonias, have not been included on justifiable grounds For these fatal issues may occur in any surgical procedure

The post-operative morbidity in this group of chronic cases can best be shown by a study of the number of post-operative days that these patients remained in hospitals, and this morbidity, in most cases, hinged upon the occurrence of discharging wounds. None of these cases were drained. An inconsequential number left the hospital with a small area of granulation, while only one patient was curretted for an intractible wound sinus.

GROUP III

The third group of 200 cases presented at the time of operation either imflammatory adnexal masses of various sizes or acutely inflamed tubes without any pronounced enlargement, save that due to an initial inflammatory hyperaemia. The masses contained either

bacteria free pus or pus and bacteria. Pus was spilled by surgical rupture of an infected mass in 83 patients, eleven presented free pus in the pelvis, dripping from the fimbric end of the tube. No data was available in the remaining cases. Briefly, there occurred in this series of purulent salpingitis, 25 deaths due to peritonitis, and four deaths due to shock. All deaths occurring within the first ten post-operative hours, when no explanatory note was found on the chart, have been listed under surgical shock. In all, there was a mortality rate of fourteen and one half per cent.

Apart from a decided increase in the postoperative convalescent period, many of these cases had either an immediate or delayed stormy reaction—distressing in some instances, alarming in others Some patients, succumbing to the strain of the surgical trauma, lapsed into shock or a shock-like condition, as evidenced by a rapid pulse rate and the recourse to drastic therapeutic measures, such as infusions and hypodermic stimulations In other cases, irregular septic temperatures continued for days or even weeks In several instances, the operator was forced to withdraw because of the patient's ebbing vitality, leaving the pelvis only partially bereft of its pathology When it is realized that these patients with purulent adnexal masses withstand the trauma of an operation poorly, and, as such, are prone to various dangerous complications, it is obvious that a premature operation subjects them to a jeopardization well-nigh fatal. The complications mentioned cannot be expressed in mathematical terms, but a tabulation of the number of post-operative days remained in hospital by this group of cases, gives a graphic portrayal of the increased morbidity rate in comparison with the other group. The increase was due either to an intermittent temperature from toxic absorption, or to a persistent discharging sinus tract. Patients drained solely per vagina showed a distinctly shorter post-operative convalescence, but not sufficient cases were found in the records to draw comparisons. Six cases were subjected to secondary operation for persistent sinus.

Pre-operative Temperature — The pre-operative afebrile waiting time in the cases listed in this group varied appreciably In many instances, patients were ushered to the operating room in the midst of an acute attack, these, on the whole, gave the largest number of casual-Six deaths occurred in cases operated with a margin of from twelve to sixteen fever-Three deaths occurred in patients operated exactly three weeks after the last temperature rise — all died of peritonitis the majority of instances, patients were admitted to the hospital without a temperature, and operated within a day or two of admis-In these cases it was impossible to ascertain the exact number of uninterrupted pre-operative afebrile days, the temperature sheets were of no avail, and the historiessome too scant, and others encumbered with irrelevant detail-lacked the pertinent data

Leucocytosis - In most instances, the leucocytosis ran a correspondingly elevated course with the temperature reaction But, in a number of cases of purulent masses with no fever, there was a leucocytic reaction varying from 11,000 to 18,000, even without a provocative examination Absence of temperature is not always indicative of an absence of in-Patients with a smouldering tubal fection infection may be fever-free, but may present a definite elevation of the white cell count Patients with a dormant focus may be both afebrile and aleucocytic, only the trauma of a vigorous vaginal examination will bring these objective manifestations to light

Nature of Organisms - Sealed tubal or tuboovarian pus without bacteria did not prove harmless in all cases, when spilled in the pelvis, as the result of operative dissection In this series several patients, contaminated with a bacteria-free purulent fluid, died of a peritonitis, and one of shock. In the cases where the pus was reported bacteria-free the writer cannot refrain from considering the possibility of error Nonetheless, the numbers are of sufficient proportions to lend credence to the belief in the harmfulness of sterile It was impossible to ascertain the number of cases originally infected with the This organism was observed gonococcus pure in smears from tubes of eight cases, and was found combined with staphlococcus in two But this merely substantiates the view

that gonococcal organisms in tubal cavities die within three months of the initial contamination (Polak, quoting Hyde), only to yield their habitat to other bacterial incursions is a non-symbiotic organism Gonorrhea of the salpinges is a self-limiting disease, it produces but one attack of pain, temperature and leucocytosis—the initial one And the attack usually lasts from several days to three weeks All subsequent exacerbations are due to secondary bacterial invasions The author was unable to ascertain with any degree of certainty, the length of time streptococci remain lurking and potentially active in tubal masses initial streptococci attack is much more severe and even alarming, it extends over a longer period of time ranging from two weeks to two months, and the symptoms on the whole are much more pronounced But attenuation in its virulence and eventual immunization of the organisms did occur, for, several cases of streptococcic tubes recovered, following operation The recoveries occurred in patients with a long-standing history of the disease

All bacteria encapsulated within tubal or tubo-ovarian masses, eventually, if undisturbed surgically, tend to diminish in virulence, to become attenuated and ultimately to Once the organisms are debe destroyed stroyed, the encapsulated purulent bacteriafree pus undergoes disintegration and resolution into harmless fluids of serous consistency A three weeks' afebrile period is not sufficient time in all cases of inflammatory adnexal masses for the complete destruction of the infected material, for the gradual process of recuperation and restoration of tissues, for the change from a septic to an aseptic surgical That this spectacular change does occur in many instances within that limited time, one cannot gainsay, but it occurs invariably in cases that have run their course, and are evincing one of the terminal mild exacerbations Whereas, for cases of pelvic masses and generalized cellulitis that run a violent septic temperature and leucocytosis for days on end, three weeks afebrile time is wholly inadequate It is primarily for these patients that the preoperative afebrile time be extended unto fully three months, if mortality and morbidity rates are to be lowered, and human tissue conserved For, however severe an inflammatory reaction may prove to be, given sufficient afebrile rest, the pelvic structures will have eventually resumed some semblance of anatomic order, and at least one ovary will have escaped the ravages of the septic storm The undaunted surgeon who minimizes genital surgery and invades the infected female pelvis, desecrating the principle of pre-operative waiting has many a gynecological sin to atone for Nature works wonders This hackneyed truism of

the clinical platitudinarian deserves a full quota of respect and appreciation when applied to infected adnexa. Masses reaching high in the abdomen shrink to markedly smaller dimensions or even to unpalpable sizes if undisturbed surgically over a given period of time.

SALIENT POINTS

- 1 Chronic, non-purulent, bacteria-free cases of salpingitis, subjected to an operation, show a minimal percentage of operative mortality and a minimal incidence of post-operative morbidity
- 2 Both the chronic purulent and the acute purulent cases of salpingitis operated either during the ferbile attack or even as late as three weeks following an acute attack present a discouraging operative mortality rate and a distressing post-operative morbidity incidence
- 3 The post-operative morbidity is either an immediate shock, a violent post-operative febrile reaction, a persistent irregular septic temperature, or a prolonged discharge from an abdominally drained pelvis
- 4 Patients with sealed tubal or tubo-ovarian pus—be the pus sterile or otherwise—with-stand the trauma of an operation poorly, and are much more prone to lapse into a state of shock.
- 5 Absence of temperature is no indication of an absence of a more or less active pelvic infection. Smouldering tubal or tubo-ovarian foci are oftentimes afebrile and aleucocytic. The trauma of a vigorous vaginal examination brings them to light, the trauma of an operative procedure may prove disastrous.
- 6 Not infrequently, patients with tubal or tubo-ovarian inflammatory masses are feverfree, but present a persistent and marked leucocytosis. This factor categorically contraindicates operation
- 7 Gonorrhea of the Fallopian Tubes is a self limiting disease. It produces but one attack of pain, fever and leucocytosis—the initial one. When subsequent attacks occur, and adnexal masses are palpable, the gonococcus has yielded its endosalpingeal habitat to secondary bacterial invasions.
- 8 Streptococci remain in adnexal masses and retain their virulence for a much longer period of time. But they do diminish in virulence eventually, as evidenced by the recovery of several cases operated for streptococci adnexitis. These recoveries occurred in patients with a long standing history of the disease. There is no known differential means of distinguishing the presence of streptococci from other organisms in adnexal masses, previous to operation.
- 9 All bacteria encapsulated within tubes or tubo-ovarian masses eventually, if surgically

bacteria free pus or pus and bacteria. Pus was spilled by surgical rupture of an infected mass in 83 patients, eleven presented free pus in the pelvis, dripping from the fimbric end of the tube. No data was available in the remaining cases. Briefly, there occurred in this series of purulent salpingitis, 25 deaths due to peritonitis, and four deaths due to shock. All deaths occurring within the first ten post-operative hours, when no explanatory note was found on the chart, have been listed under surgical shock. In all, there was a mortality rate of fourteen and one half per cent.

Leucocytosis — In most instances, the leucocytosis ran a correspondingly elevated course with the temperature reaction. But, in a number of cases of purulent masses with no fever, there was a leucocytic reaction varying from 11,000 to 18,000, even without a provocative examination. Absence of temperature is not always indicative of an absence of infection. Patients with a smouldering tubal infection may be fever-free, but may present a definite elevation of the white cell count. Patients with a dormant focus may be both afebrile and aleucocytic, only the trauma of a vigorous vaginal examination will bring these objective manifestations to light.

Nature of Organisms - Sealed tubal or tuboovarian pus without bacteria did not prove harmless in all cases, when spilled in the pelvis, as the result of operative dissection In this series several patients, contaminated with a bacteria-free purulent fluid, died of a peritonitis, and one of shock. In the cases where the pus was reported bacteria-free the writer cannot refrain from considering the Nonetheless, the numpossibility of error bers are of sufficient proportions to lend credence to the belief in the harmfulness of sterile It was impossible to ascertain the number of cases originally infected with the gonococcus This organism was observed pure in smears from tubes of eight cases, and was found combined with staphlococcus in two But this merely substantiates the view

was given hot with an intent to enhance uterine contractions as well as to cleanse the colon. If the contractions did not occur at 5 minute intervals or oftener and the cervix was not dilated over two fingers, an interval (in one case 7½ hours) elapsed between the enema and the first hypodermic. A few received the morphine and magnesium sulphate fifteen minutes after the cleansing enema

IV FIRST INTRAMUSCULAR INFILTRATION

Nearly all of my cases received 1/4 of a grain of morphine sulphate with 2 cc of 50 per cent magnesium sulphate solution Some received 1/2 of a grain with the MG SO, and a number were given 1/150 grain of atropine sulphate in addition to the other two ingredients not prove to my own satisfaction that the atropine had any effect other than to render the secretions of the mouth and throat very deficient of which some patients complained bitterly far as counteracting the bad effect of the morphine on the baby, my end results show more apparently narcotized babies from mothers who received atropine. The atropine is not given as a part of the regular treatment outlined by Dr My reason for using it was because of the apparent large percentage of babies requiring resuscitation following the use of synergistic analgesia

V CERVIX AT THE TIME OF FIRST HYPODERMIC

Three patients received their first hypoderinic when their cervices were dilated completely and all three of these delivered too soon for any subsequent treatments. Five when four fingers, sixteen when three fingers, fourteen when two fingers and one when only one finger dilated. This last cervix was thick but the head was well engaged and the pains were intense, lasting 45 to 60 seconds recurring regularly at one-minute intervals. She was a primiparous patient who four hours later received her retention enema and subsequently after four hours and twenty minutes of relatively painless labor delivered easily with a low forcep assistance without lacerations.

VI CHARACTER OF PAINS WHEN THE FIRST HYPO WAS GIVEN

At the time the first intramuscular infiltration was given the pains recurred oftener than two minute intervals in eight cases. The remaining thirty-one patients had intensely painful uterine contractions at 2 to 5 minute intervals lasting 30 to 60 seconds

VII MEMBRANES

The membranes had been ruptured spontaneously at the time of the first treatment in 16 cases. They were intact in 23 cases

VIII Position and Pelvees

There were 13 occiput transverse, one occiput posterior and 25 occiput anterior positions, all of which delivered as anterior positions except two transverse and one that went out of labor

One woman had a generally contracted pelvis, another a funnel pelvis, and a third a pelvis with unusually prominent ischial spines. There were four male type pelvees and two simple flat. The remaining thirty were normal.

IX EFFECT OF THE INITIAL HYPODERMIC

- On the mother -The effect of the morphine and magnesium sulphate on the mother was definitely sedative in 17, slightly sedative in 18 and not sedative in four cases. Three of these four received their hypo rather late, the cervix being completely dilated and delivery occuring within one hour after its administration three of these babies gave a lusty spontaneous cry promptly after birth One weighed 8 lbs 9 ozs, one 6 lbs, and the third one weighed 7 I go into detail on this feature because it is considered poor practice to give morphine an hour before the birth of a child for fear of I might add that two of these had their morphine and magnesium plain with-The other had 1/150 of a grain out atropine. of atropine added to the regular hypo
- 2 On the baby—There was no apparent effect on the baby in utero as evidenced by the heart beats in any of the 39 cases after the morphine and magnesium sulphate

X FOURTEEN PATIENTS DID NOT RECEIVE THE SECOND ANALGESICS

The first of these went out of labor. The second did not seem to get much relief and she refused the retention enema. Her labor seemed to be prolonged. The third, fourth and fifth not receiving the oil ether enema delivered within an hour after the initial hypodermic with little or no apparent relief of pain except that received by the subsequent administration of chloroform.

The sixth, a multif, stayed in labor 14 hours after the hypodermic with little or no progress I believe the infiltration may have prolonged her She was partially relieved of pain and her cervix became quite soft but would not dilate, nor would the head engage in spite of a normal pelvis and an occiput anterior position in good flexion Eventually the fetal heart could not be heard and I did a manual dilatation with version and extration The baby was pale, flaccid and one month premature, but after 5 minutes resuscitation without tubing, a vigorous cry was produced. The remaining eight delivered within 4 hours with marked analgestatand no complicat ~~ -tions

undisturbed for a sufficient period, tend to diminish in virulence, to become markedly attentuated and, eventually, to be destroyed. The encapsulated pus, once the bacteria are destroyed, gradually resolves into harmless fluids of lesser consistency.

10 Patients with pelvic masses harboring organisms of various types, the streptococci included, may from an economic point of view, be considered below par, but they are never totally incapacitated save during an acute exacerbation. As time goes on, the interval between the attacks increases and the severity diminishes

MORPHINE AND MAGNESIUM SULPHATE INFILTRATIONS AND COLONIC ETHER INSTILLATIONS IN THIRTY-NINE CONSECUTIVE LABOR CASES*

By W B D VAN AUKEN, MD, TROY, N Y

ABOUT two years ago my opinion of Dr Gwathmey's Synergistic Analgesia was so favorable that I titled a paper on the subject, "Painless Childbirth by Synergistic Methods" My opinion of its practicability was largely formed by the reports given me by its promoters together with observations of thirty-five cases which I closely studied at the New York Lying-In Hospital

Since that time I have worked with other men who discredit its usefulness and who are in favor of more timed treatments for the relief of labor pains. Believing, then, that its promoters as well as its critics might both be somewhat biased, I was determined to find out for myself its value by giving it a fair trial and recording its effect.

I have watched closely all the cases which I herewith report, and in almost every instance the treatments have actually been given by me As I used the methods, I recorded the results at the bedside of the patient, trying to interpret them with all fairness to its promoters and critics alike

Those who are still unfamiliar with the technic of administering morphine and magnesium sulphate with colonic ether instillations may familiarize themselves with its detail by studying the excellent article by Dr Asa B Davis found in the June issue (1925) of the American Journal of Surgery, Gynecology and Obstetrics, page 868

Briefly, it consists of cleaning the colon, giving intramuscular infiltrations of morphine and magnesium sulphate using a 19 gage needle 1½ in long and in giving colonic instillations of oil ether using a 20 or 22 French catheter attached by a rubber tubing to a funnel

The records which I made at the bedside were carried forward on a large chart having thirty-

* Read before the Rensselaer County Medical Society, October 12, 1926

six divisions, noting the progress of the patient and the time of administration of the treatments from the onset, to the final termination of the case, with remarks on the end results

I Number and Type of Case

In my series I treated a total of thirty-nine consecutive patients, nineteen of whom were primiparous, and twenty of whom were multiparous, of all grades of social and intellectual standing. Some of the patients were treated at home and others at the hospital

II DURATION OF LABOR BEFORE TREATMENTS

The average duration of labor before beginning the treatments was nine hours. In multiparous alone it was 10 hours, in primiparous, 8½ hours One multiparous patient (a Hydramnios case) had been in labor with irregular ineffectual contraction 23 hours before the first treatment One primiparous patient had only been in labor 2½ hours These two represent extreme intervals It would naturally seem that multiparous patients should receive the treatments earlier than primiparous ones, masmuch as their labor is usually shorter That this should reverse in my series is explained by the fact that no patient received the treatments unless their suffering seemed intense or prolonged I do not use it as a routine in every case

III CLEANSING ENEMA

Thirty-four patients received a hot suds enema before the first hypodermic. The other five had such severe pains that it was thought better to give the hypodermic first and to cleanse the colon subsequently. One of these five did not receive the cleansing enema at all as she delivered twenty-three minutes after the hypodermic of morphine and magnesium sulphate. The soap suds enema

senting the excitement which some patients manifest during the first stage of respiratory anæsthesia. I believe this excitement was due to too long an interval between the initial hypodermic and the colonic ether with magnesium sulphate. It only lasted about 20 minutes in 2 of the 3 and was followed by marked analgesia, but it was almost impossible to keep the other patient on the delivery table during the entire second stage.

The average duration of the analgesic effect following the retention enema was two hours and

fifty minutes

XVI ADDITIONAL HYPODERMICS

Additional hypodermics were given to only 4 patients but a few might have been made more comfortable by its use. Many of these cases were delivered in the home and the mental effect of using so many hypodermics with the friends as well as the patient herself, is not always of the most encouraging nature.

XVII SECOND RETENTION ENEMA

The second retention enema was not given in any of the cases

XVIII THE DELIVERIES

The deliveries were spontaneous and normal in 29 cases, 2 of which were occiput transverse and 27 occiput anterior. There were 4 low, 3 medium, and 1 high forcep delivery, also, 1 Podalic version and breech extraction.

XIX RESPIRATORY ANASTHESIA AT THE END OF THE SECOND STAGE

The respiratory anæsthesia at the end of the second stage was not required in one case due to the anæsthetization produced by the retention enema fluid. She delivered almost painlessly after a total labor lasting 13 hours and 40 minutes. Her baby was small and about 3 weeks premature and required prolonged efforts at resuscitation.

Seventeen were delivered with only a few respirations of anæsthetic while the remaining 20 required the anæsthetic for a longer period. I used chloroform in cases where the oil ether instillation had not been given and ether in those who had received it

XX Injurious Effects of All the -Analgesic Treatments

1 In regard to the mother—With the exception of 6 who showed transitory tachycardia without other causes for it, I could not note injurious effect of any character even after following up the cases 2 to 6 weeks after the deliveries. None complained of any subsequent rectal disturbances. One said her rectum hurt At first we thought it was a sequel to the oil ether

but after loosening one of the interrupted perneal stay sutures the trouble promptly subsided. One patient developed a large gluteal abscess where the first hypo had been given, but I believe this was due to the medicines used.

2 In regard to the baby—Thirty-one gave spontaneous respirations and were otherwise normal. Two required a moderate amount of resuscitation and five required from 10 to 20 minute resuscitation.

The first of these five was small and about 3 weeks premature, it was born of a multif with a normal pelvis and a premature rupture of the She had mactive first stage labor membranes 10 hours when the cervix was found dilated 3 fingers, thick, firm and high Morphine 1/6, with atropine 1/150 and the 2 cc of 50 per cent solution of magnesium sulphate was given in a single intramuscular infiltration directly after the ex-She had an LOT and her pains amination recurred at 3 minute intervals and lasted 40 seconds The effect of the hypo was sedative. Her retention enema was given one hour after the first hypo and according to the regular routine she also received a second intramuscular infiltration of 2 cc. of magnesium sulphate at the time of the colonic instillation

Her colon had been washed out with soap suds 5 hours previous to the instillation and tap water which had to be siphoned back 10 minutes before the colonic instillation She was analgized and partly anæsthetized but her contractions continued and a spontaneous painless delivery, without respiratory anæsthesia, occurred 2½ hours after the retention enema a relatively painless labor and childbirth without laceration but lost about 900 cc of blood-after a spontaneous termination of the third stage. As far as I can determine, the reason for the condition of the baby was, first, its prematurity and, second, perhaps the toxic effect of the drugs given to the mother It could not have been from too long a labor as it lasted only 131/2 hours

The second baby requiring prolonged efforts at resuscitation was born of a primif with a normal pelvis She had been in labor 5 hours before the first hypodermic was given. This hypo contained no atropine and had 1/4 of a grain of morphine rather than 1/6 with MGSO. At the time of this medication her cervix was 3 fingers, thin, firm and low and her pains re-curred at 2 to 5 minute intervals and lasted 30 to 40 seconds The membranes ruptured prematurely at onset of labor and the position was Her first cleansing enema of SS was given at 8 P M, the tap water was omitted and the retention enema was given at 9 30 P M (1½ hours after the soap suds) She was relatively free of suffering till the spontaneous birth of the baby at 12 58 A. M, and then only required a very little ether by the respiratory route Her total labor lasted only 10 hours She sus-

XI INTERVAL BETWEEN FIRST AND SECOND Hypo with Oil Ether

The average interval between the initial hypodermic and the second with the colonic ether treatments, administered to the 25 patients who received it, was 2½ hours. This interval in one instance was the extreme limit of 7½ hours, it being lengthened because of the marked sedative action of the morphine and magnesium. Her contractions seemed continuous and regularly recurrent but the head, an occiput transverse, was slow in engaging. She cooperated well but was very worrysome.

Three others of the opposite extreme (primiparous patients who cried almost continually) received the retention enema 35 minutes after the initial hypodermic. One of them expelled nearly all of it, an hour after its administration. The other two retained it and received great relief

It was not always possible to give the retention enema as promptly as needed because it was rather difficult to cleanse the bowel. Many times my nurse would have to siphon back the tap water.

XII TO FAVOR RETENTION

I might emphasize the importance of getting the catheter well up past the presenting part. If this is done much less discomfort is noticed from the senation of heat and the desire to defacate which at times is quite annoying. Another helpful procedure in enabling the patient to retain the fluid is to keep the funnel only partly full, allowing some of the fluid to return during the height of uterine contractions. We now keep the entire apparatus in position for 5 or 10 minutes after the fluid is introduced. Doing this, we catch back in the funnel what might otherwise be expelled into the bed

XIII IN REGARD TO THE PREPARATION OF THE FLUID

Twenty grains of quinine hydrabromide are dissolved in 3 drams of alcohol and placed in a four-ounce bottle. This I keep ready in my bag at all times and when desired I add 2½ ounces of ether from a fresh can and enough olive or cotton seed oil to fill the bottle. I formerly kept 2 or 3 bottles of the ready prepared fluid in my bag but after being carried around in an auto for a few weeks, the bottles occasionally would break or the quinine would precipitate. This was quite noticeable in cold weather. Most every patient has olive oil in the home and its a simple matter to mix the ingredients as needed just before giving the treatments

XIV AMOUNT OF RETENTION ENEMA FLUID

The amount of retention enema fluid to be given according to Dr Gwathmey is the entire contents of the bottle, prepared as above.

He claims that the distention of the bowel

produced by introducing the entire 4 ounces prevents too rapid an absorption of the ether and has proven that oil ether mixtures in the colon are slowly and continuously absorbed over a long period of time Some obstetricians vary the amount of the mixture with the height and weight of the patient but in this series we have always given the entire contents of the bottle at a single 5 to 15 minute instillation One patient, however, got about 7 ounces of the fluid at one time This happened to one of our cases by mistake whom we confined at home. She was a 24-yearold primif (a striking blonde with very white skin) who weighed 130 lbs at term, measured 5 feet 5 inches She had had mactive labor 131/4 hours when she received her first intramuscular infiltration at 7 15 A M At that time her cervix was only 2 fingers dilated and quite thick The effect of the hypo was markedly sedative for 3½ hours I was out to lunch when my nurse phoned me at 1 30 P M that her contractions were becoming very painful and she was not cooperating, so I ordered the retention I had two bottles of the fluid in my bag and she mistook one of them for olive oil One being prepared with heavy liquid petrolatum and the other with olive oil She used the amber colored fluid in the place of oil which Dr Gwathmey recommends being placed in the apparatus to exclude all air

She later reported that the fluid went in very easily and so she used what she thought was an additional 2 ounces of olive oil after the special fluid was introduced, making the total oil ether The patient promptly enema about 7 ounces went to sleep and was not aroused by the contractions which continued at 3 and 4 minute intervals for three hours I then made a vaginal and finding the cervix fully dilated, ruptured the bag of waters She began to suffer moderately after the 3 hours of sleep but her contractions gradually became less frequent and shorter This was the only patient to whom I gave pitutrin She was given 8 drops at 5 15 and again at 6 15 We used 4 ounces of ether by the respiratory route during delivery and the repair was difficult to secure relaxation or to prevent the onward rush from the pitutrin. In spite of all the ether given to the mother, together with the morphine gr 1/4 and magnesium sulphate, the baby gave a spontaneous cry and the mother was in good condition and made an uneventful recovery

XV EFFECT OF RETENTION ENEMA FLUID AND SECOND HYPO

The effect of the retention enema fluid and second hypo was analgesic in 22 of the 25 cases who received it. All of these 22 patients were quiet between pains, some of them sleeping, a few others even seemed anæsthetized. The other three were decidedly stimulated, pre-

of pain for 2 to 8 hours, 6 were partly relieved, one of these 6 expelled part of her retention enema. In 2 the relief was doubtful, one being an ignorant neurasthenic who kept calling for ether and who was immediately quieted by placing a mask over her face with some paraldehyde on it. The other did not receive sufficient treatment due to my delay in getting on the case. No relief of pain was apparent in 7 cases. One of these 7 expelled a large amount of the retention enema and 4 others were only given the first hypo, the treatments being started too late to give the oil ether, or other treatments

Four of the 39 labors were apparently delayed by the treatments and one went out of labor This patient was a multif who had had infrequent pains for 7 hours preceding the initial hypodermic containing 1/6 of a grain of morphine with the 2 cc. of magnesium sulphate Her cervix was soft and dilated 21/2 fingers and she had pains every 5 minutes lasting 30 seconds at the time of the hypo Her pelvis was normal and the vertex at the superior straight in an Her only complication was fib-LOT position My record roids in the lower uterine segment on the case states that the hypodermic was apparently given too soon before the labor was well started

I use the word apparent rather frequently in giving my final opinion of the results because we have no way of determining just how this or that patient would have acted if she had not received the treatments

The average duration of labor in the entire series was 15 hours and 16 minutes. The multiparous women averaged 14 hours and 12 minutes. The primiparous, 16 hours and 20 minutes. I believe that these low figures were made.

possible by my routine use of quinine sulphate in 3 to 10 grain doses repeated when necessary in every case where labor seemed to slow up. One patient who could not retain anything by mouth received quinine hydrobromide gr xx, dissolved in 3 drams of alcohol and added to 1½ oz of olive oil by way of the rectal route, using a small infant syringe

In concluding my paper I submit a chart and a few remarks from other obstetricians outside of New York City My reasons for confining my reports to regions outside of New York are because, as most of you know, new automobiles run very well in their own garage, but the time to tell whether they are practical or not is to get them out in the country with strange guidance and a different road bed, and then average results

I have numbered these M D 's instead of publishing their names Their names may be secured on request

Another doctor reported to me that he believes

- 1 The dose of magnesium sulphate is practically useless
- 2 It is not adaptable to every case, in fact, only about 75%
- 3 Results vary considerable. It is not much good if given too early or too late
- 4 A large part of its good results are attributable to the morphia
- 5 Some labors are apparently shortened by its use
 - 6 It has practically no effect on babies

A second is using magnesium sulphate with the old time morphine and scopolamin and reports very good results in 33 cases

tained a 2° laceration but had no hemorrhage The baby was a normal full term child and did very well after we finally succeeded in establishing respiration

The third baby requiring an unusual amount of resuscitation was born of a primif with normal pelvis-who had been in mactive labor 14 hours before the first hypodermic which conained morphine 1/4, atropine 1/150 and the usual 2 cc of magnesium sulphate When this medication was given the cervix was widely dilated with the membranes intact. The first hypowas moderately sedative but when the second hypo with the retention enema was given one hour later at 5 P M, the sedative action was increased and practically complete analgesia was present with consciousness She was mentally alert The medication was acting as a stimulant as well as analgesic. Her labor continued as before and the membranes ruptured at 6 P M delivery was spontaneous at 6 45 P M, after a total labor lasting 16 hours We only gave her a small amount of ether while the head was being born and during a first degree repair mother received a soap suds enema at 4 35 P M and her retention enema at 5 P M. The tap water enema being omitted. I thought that the baby's condition was due to the delivery coming too soon after the medication or possibly to strangulation produced by a very tight cord around the child's neck. It was a full term child and weighed 7½ lbs

The fourth was born of a multif with a simple flat pelvis and a history of having a stillbirth three years ago She had had rather active labor 3 hours before the first treatment which contained atropine grain 1/150, morphine 1/4 and the usual MGSO, Her baby was an LOA and her cervix was fully dilated with membranes ruptured and 3 minute pains. The medication produced a marked analgesic action and did not at all decrease the frequency or duration of the contractions It was not necessary to give the retention enema as the suffering was sufficiently reduced, using the patient's own words she said, "These pains ain't near so bad as before youse Her baby was born 2 hours after the hypodermic We used a little chloroform for 10 minutes with a Reynolds inhaler at the end of the second stage The shoulders became impacted in the smallest diameter and a fractured right clavicle was sustained before birth became complete. The duration of her labor was seven There was hours and her baby weighed 9½ lbs a bad 2° laceration but no hemorrhage still a question in my mind whether the prolonged resuscitation (including tub-bing, mouth to mouth respiration and intra-pharyugeal catheterization) was made necessary because of the hypo or because of the increased intra-cranial pressure during moulding. She had an estimated true conjugate of 9 cm with a steep symphysis measuring 63% cm

The fifth was a month premature, being born of a multif with a normal pelvis and a history of having had her last baby 15 years ago. She had been in mactive labor 23 hours previous to the treatments and had suffered for 2 months with pressure from hydramnios. Her first hypo was given when the cervix was 3 fingers dilated and her pains were intense, recurring at 2 minute intervals and lasting 30 seconds. She had an LOA with spontaneous rupture of membrane, 12 hours previous to the hypo. She was exceedingly nervous and apprehensive and talked or groaned incessantly. The hypo produced no sedative action after an hour interval and the patient would not cooperate.

One and a quarter hours after the first hypo we gave her the second, with the retention enema She would not permit much manipulation, hence we omitted the tap water enema. She had received an SS enema 3¼ hours previous of her retention enema was expelled and she complained bitterly of the burning sensation and an intense desire to move her bowels. This discomfort passed away 15 minutes later and she became a very quiet patient between pains and cooperated well with each contracture, till 20 minutes before the delivery, when she became We then gave her intermittent inspirations of ether and delivered a spontaneous LOA 2 hours and 5 minutes after the retention enema or 3 hours and 20 minutes after the morphine

Her labor lasted 28½ hours There was no laceration or hemorrhage but resuscitation had to be continued for over 20 minutes before a cry could be produced. As usual with prematures the extremities were quite blue and rather cold. We did all that was possible to do in a home to revive that baby and keep it warm but it died at the age of 14 hours, it being the only mortality of the entire series. I believe the cause of death was hydramnios and prematurity, but I was unable to get an autopsy. There may have been some circulatory developmental defect inasmuch as it was very difficult to get a good color or the normal warmth to the skin following its birth.

Analyzing the apparent cause of prolonged resusitation in these five cases outside of the possibility of the treatments as a casual factor we find that two were premature, one 3 weeks, the other a month, one was normal in every particular, another had a cord tight about the neck, and the fifth may have been produced by increased intra-cranial pressure during moulding through an abnormal pelvis

XXI. SUMMING UP THE FINAL RESULTS OF ALL THE TREATMENTS

Summing up the final results of all the treatments, I found that 24 were definitely relieved

lowances for preoccupation and for overfatigue Pressed to the limit under ordinary circumstances to keep ahead of his work, the additional strain of family illness is often just enough to cause a worker to fall behind and he may lose his position at a time when he most needs to keep it

I have been greatly impressed with another way in which illness among children plays havoc with family life If, as often happens, a mother must take one or more children to a dispensary for treatment extending over a considerable period, she loses a great deal of time from her household duties Often it amounts to two or three hours daily, and sometimes more, away from her home. I have always marvelled at the splendid way so many of these mothers, in addition to bearing and nursing six or eight children, also cook, clean house, wash and mend the clothing for their large families and still have time and ambition to plan for their education and to help them reach a somewhat higher level of comfort and opportunity than they have enjoyed themselves Even when everything moves smoothly, there are hardly enough minutes in the day for such mothers to complete their tasks them away from home for three or four hours daily and something must suffer. It is generally the children who are not with her at the dispensary who suffer They are either locked up alone at home, left with a slightly older child or with a none too careful neighbor, or turned out into the street Also, the preparation and planning of the meals is bound to suffer They are often gotten together in a hurry and poorly It is self-evident what a detriment this is to the hard pressed, tired worker

If but one parent is living, the children must be left in a day-nursery, while the parent is at work When the children are ill, unless they are very ill, they cannot go to a hospital nor may they remain at the nursery Therefore at just the time when expenses due to illness are rising, the parent is obliged to stop work and to remain at home to

take care of the children

It would not be important to recount these conditions were not a large percentage of these illnesses preventable This being the case, a great deal of the lowered efficiency of the wage-earning parent is preventable.

It is of even greater importance that illness among children often leaves their health permanently impaired and consequently many of them enter industry later on incapable of thoroughly efficient work

The first six years of life are tremendously important to the child's future satisfactory development In infancy he makes greater adjustments to his surroundings than ever again in a similar length of time. He becomes accustomed to new degrees of temperature, and to new sights and sounds He acquires habits of eating, sleeping, bowel evacuation He learns an entire language.

From being the center of attention as an infant, the runabout must take his place with other children and learn group-living Where -circumstances are favorable the child builds during these first six years solid foundations for optimal physical and mental development

Not until a large percentage of applications for the U S Army during the World War were rejected because of their unsatisfactory physical condition, was it generally recognized that more attention must be paid to the health and development of children if they are to be truly healthy

and efficient when they become adults

One reason for our previous failure to realize the poor physical condition of the average child was the fact that there have been few if any authoritative statements of exactly what is satisfactory health and development in childhood Thus there has been no adequate norm against which to measure a child, and we have been satisfied with low standards whereas it is quite possible to achieve much higher standards More satisfactory signs of health are being determined Even a very simple statement will show to a certain extent the degree of physical health and development which may be acquired by a large majority of children

Bright, clear eyes with normal focus and movements Unobstructed nasal breathing Clean moist tongue Well formed and well enamelled teeth Mucous membranes definitely pink Subcutaneous tissue plentiful Muscles firm and strong Shoulders level, chest broad and deep, with good expansion Straight limbs and strong joints Arches of feet strong and limber Inner border of foot straight from heel to tip of great toe

Weight suitable for height and age Good posture. Alert, happy expression

Prompt, efficient muscular coordination Bodily repose

Physical and nervous endurance These briefly are indications of ideal health and

development

With this picture in mind, let us glance quickly at what is a not uncommon history of childhood A difficult first year, no breast milk, unsatisfactory artificial feeding, rickets, poor teeth, enlarged adenoids and tonsils, frequent colds, abscessed ears, often neglected for a year or more resulting in deafness, poor appetite, too little rest, contagious diseases-poorly treated and often developing complications, as a result of the foregoing, malnutration with lowered resistance to infection and lessened capacity for skilled and enthusiastic effort. Of course all of these conditions are not present in every case, but far too A third and fourth report on the use of 2 cc of magnesium sulphate without morphine or any other narcotic in more than 1,000 patients suffering with pain as well as insane patients. They say that it is sedative in 15 to 30 minutes and that often the patients sleep for 5 to 7 hours. They further state that the salt is quite harmless and the dose necessary for a sedative effect can be given liberally when necessary.

A fifth operated on 125 cases in the home, using 5½ oz of ether with 2 oz of olive oil per rectum. He did hysterectomies gastro-enterostomies, choelecystectomies, resection of nasal septum, dental extractions, perieorraphies and hemorrhoidectomies. He says its advantages are ease of administration, absence of apprehension, coughing, retching, straining, shock, and post-operative vomiting. He gives bromide the day before the operation and colonic washing with a hypo of hyocine on the day of the operation.

A sixth uses oil ether routinely for operations

about the head, face or throat

A seventh, reporting on the comparison of results obtained using morphine grain ½ and 2 cc of MG SO₄ (25% Sol) in 60 labor cases with a like number not having the medication, makes note that the hypo had a sedative action in the large majority of cases He says that it did not in any way increase the foetal or maternal mor-

bidity and that this method is simple, safe and inexpensive

An eighth is not prepared to give any figures on its use in labor cases. He says, however, that he had been quite pleased with results and his impression of its use is a satisfactory nature. He has not observed any untoward symptoms in either the mother or child

At the C M S Hospital, Cairo, Egypt, rectal anæsthesia is used for operations on the head. Three ounces of ether neck, chest and arms with 1 oz of oil is used in proportion of 1 oz of the mixture to every 20 lbs of body weight Their technique is to cleanse the rectum a few hours previous and to give morphine and atropine 13/4 hours before the operation, and the oil ether 1½ hours before the operation This administration is finished 1 hour before the operation is I cite this example of colonic ether anæsthesia to show the slow and continuous absorption of ether by rectum. Hence the necessity of administering the colonic ether at least 1 hour before childbirth to secure maximum effect

And finally another, reporting on the use of synergistic analgesia in 40 labor cases, savs that the labor is delayed in 20% of cases, and says that that obstacle is easily overcome by the frequent use of pituitrin

SUPERVISION OF THE HEALTH OF THE PRESCHOOL CHILD—ITS RELA-TION TO THE EARNING CAPACITY OF THE WAGE EARNER*

By HUGH CHAPLIN, MD, NEW YORK, N Y

THE first step in the development of Industrial Medicine was the treatment of injuries The second step was prevention of injur-The third ies by improving working conditions was an effort to increase the efficiency of the wage earner himself by improving his health This included physical examinations both at the time of applying for work and periodically thereafter It also included efforts to improve conditions in the worker's home But, according to Dr Harry E Mock, only in some industries, as in mining communities, or large steel communities and in the case of one or two large railroads, has this medical and surgical treatment been extended to the families of employees" It is the health of their children and its relation to the earning capacity of wage earners which we are to discuss in this paper

The types of illness most likely to occur among children are nutritional disorders particularly in infancy and the acute contagious diseases of preschool age. There are also the ever-present respiratory infections so frequently complicated by involvement of the ears and by pneumonia.

*Read before the Section on Public Health and Industrial Hygiene, College of Physicians, Philadelphia February 14 1927 The chronic and slight afflictions may be treated in a dispensary, or at home by a private physician. The acute, more serious conditions require either hospital ward care or considerable attention at home by a private physician. If a physician is necessary there is at once a considerable financial drain upon the family budget. In either case medicines and sick-room supplies are sure to be required and these are often costly. Therefore even with the help of free hospitals and dispensaries illness is invariably a strain upon a family's resources.

In addition to this, when a man's children are ill it stands to reason that he cannot work as efficiently as when they are well. Even if the illness is slight he cannot be entirely free from anxiety and it does not add to his peace of mind to realize that his expenses are increasing. If the illness is critical it is often impossible for him to concentrate his attention upon his work. He is likely also to miss a great deal of sleep at night doing his share of the nursing and this loss of sleep adds to his inefficiency. Many occupations require most careful and continuous attention. This the worker cannot adequately give. The requirements of industry are rigid and do not make al-

THE EFFECT OF OBSCURE MASTOIDITIS UPON NUTRITION IN INFANCY By S W CLAUSEN, MD, ROCHESTER, N Y

7HE chief causes of severe diarrhea in infancy are (1) Improper feeding, (2) Intestinal infection with the bacillus of dysentery, (3) Infections outside of the intestinal tract The most important of the latter are respiratory infections In 1925, Marriott called renewed attention to the presence of obscure infections of the mastoids in cases of cholera infantum concluded that early operative treatment was indicated in all such cases The present paper is a review of similar cases so far observed at the Strong Memorial Hospital in Rochester our purposes, we may regard mastoiditis as an infection of the mastoid antrum, whether or not surrounding air-cells are involved or even exist Such infection undoubtedly is a passive accompaniment of many cases of otitis media We reserve the term mastorditis in this article for those cases in which at operation or at autopsy there was found pus or granulation tissue in the mastoid antrum Frequently, there was obstruction to the egress of such pus, and frequently even in infants under 5 months of age, there was extensive necrosis of the surrounding bone. study includes three groups of cases (1) All cases of severe diarrhea not due to the Bacillus dysenteriae, (2) All cases of mastoiditis under two years of age proven either by operation or by autopsy and (3) All cases under two years of age suffering from otitis media without the above mentioned proof of the presence of mastoiditis Some of the conclusions will be briefly stated at this point.

Among 25 instances of the severe type of diarrhea known as "cholera infantum" there were 13 cases of a type of mastoid infection which deserves the term masked or obscure, without the usual local evidence of infection in the mastoid such as swelling, redness and tenderness was usually otitis media but sometimes only a grayness of the drums could be found One of the most important local signs was sagging of the posterior portion of the canal wall near the drum Eight other cases with these signs proceeded to recovery when the ear drums were incised though we believe that a mastoid infection may have been present, it would appear more conservative to classify these cases for the present as One child died of "prematurity" otitis media In two cases in which there was no infection of the mastoids, there was definite evidence of infection of the nasal sinuses These 25 cases comprise all of the cases of severe diarrhea observed It should be noted that in none of our cases could the diarrhea be attributed to faulty diet.

Mastoiditis under Two Years of Age -Our

voungest patient was a premature infant which failed to respond to feeding with breast milk and transfusion of blood Autopsy showed bilateral, suppurative mastoiditis Three groups of cases were observed (1) Cholera infantum in 13 cases, (2) Vomiting and loss of weight without diarrhea occurred in two cases which ordinarily would have been diagnosed pyloro-spasm. In one instance, rapid gain followed a mastoid operation which was performed because the patient had recurrent otorrhea and slight fever, (3) Mastoid infection was associated with chronic malnutrition in 8 cases We do not maintain, of course, that all cases of malnutration in infancy are due to infection of the mastoids or indeed to any infection at all, but in the cases mentioned there had been chronic otitis media associated with persistent or intermittent otorrhea. (4) Frank infection of mastoids was rare occuring in only 2 cases under 1 yr and in 2 cases between 1 and 2 yrs It was invariably unilateral as is usually the case in later life. The signs and symptoms were typical

Otitis Media—The cases in our services did not usually present the picture of severe gastro intestinal upset, chronic malnutrition nor chronic otorrhea. Among 22 cases of otitis media, there were, however, 8 with severe diarrhea and desiccation. These symptoms subsided when adequate drainage had been secured.

The data so far presented only indicates that obscure mastoiditis is very frequent in cholera infantum and that chronic mastoiditis is occasionally seen in chronic malnutrition. To demonstrate that the infections cause the symptoms mentioned, we must show that these symptoms can be relieved when the infection is adequately treated. This can best be done by citing illustrative cases.

FS-Obscure Mastoiditis, Diarrhea, Desiccation, Operation Recovery -A baby boy 4 mos old who had never been nursed was first seen at the age of 2 mos with signs of tetany from which he promptly recovered under adequate treatment He received bad care at home and suffered from frequent, severe nasal infections He finally developed high fever, diarrhea and loss of weight Both ear drums were red and bulging and the canal wall on the right sagged considerably Because of very alarming general symptoms of desiccation, the child received large quantities of Ringer's solution and both drums were incised Diarrhea improved and the patient gained some of his lost weight but fever persisted as did the otorrhea One week later, because the child was no longer gaining in weight and because enlarged glands had appeared behind the right ear

*Read at the Annual Meeting of the Medical Society of the both mastoids were opened Pus and granula-

often a great many of them are present It takes little imagination to see that children with such handicaps cannot develop into thoroughly efficient adults

Again, it should be repeated that much of the

foregoing history can be prevented

To what extent can proper supervision during the first six years of life prevent the serious consequences sure to follow such a history?

The experiences of Dr. Julius P. Sedgwick² in Minneapolis in 1920 and of Dr. Frank H. Richardson in Nassau County, Long Island, in 1923, demonstrate impressively that breast-feeding can he satisfactorily practised in a very large percent-This alone practically ensures sucage of cases cessful nutrition for the greater part of the first Any additional artificial feeding which may be necessary need no longer be the anxiety and uncertainty it once was, if it is carefully super-Proper food and enough cod liver oil and sunshine can largely prevent rickets thus ensuring a well built bony framework and the absolutely necessary blessing of soundly built teeth Early correction of eye strain lessens nervous tension, ensures more rest, greater happiness and a more successful childhood Obstructive adenoids and tonsils, resulting in a varied assortment of consequences, can be removed early instruction and frequent follow-up home visits by experienced nurses, habits of eating, sleeping and bowel elimination can be improved Malnutrition with its deadening effect upon ambition and enthusiastic effort may be largely prevented All of these preventive measures will almost certainly increase a child's general resistance so that the omnipresent "common cold" will be less often Disease, injury and malformation encountered of joints can be early discovered and steps taken at once for relief Diphtheria and smallpox ought to be practically unknown if we make complete use of our present knowledge

No one expects that all of these conditions will be prevented in every instance. However, an adequate program of supervision during the first six years of a child's life can prevent a large percentage of them

Exactly what measures are suggested to obtain this prevention? In so short a paper as this, sound general principles are all that can be wisely offered. In so far as Industrial Medicine is to apply these principles, those who are experienced in its practice will best know how it can be done Broadly speaking, however, the following program may be suggested.

The more prosperous workers should have their children examined at frequent intervals either by their family physician or perhaps by a physician connected with an industrial medical department. In either case, the physician should be especially qualified for this preventive type of medical work. He should be familiar with the nutritional problems of infancy and early child-

hood, should be trained to detect early tendencies towards disease or maldevelopment, and should be experienced in teaching right principles of living. There must be awakened in the parents an intelligent desire for such help and there should be in the physician an equally intelligent desire to satisfy this need.

For the poorer worker, the same kind of service should be provided, perhaps by health clinics. In addition to frequent examinations for the detection of physical defects, follow-up by nurses trained in home-visiting is absolutely essential. Only by this means will the defects really be corrected and the constantly needed health education ever be accomplished. Protective vaccination against smallpox and diphtheria can be performed at such health clinics and the children referred to other special clinics or to hospital wards as their condition warrants. In other words, all children of wage-earners should receive continuous medical supervision.

These measures are no longer visionary and untried Nearly every large community has one or more centers where just such a program has been carried on for a number of years. It is the hope that this program may soon be extended to all children, which may perhaps be criticized as visionary, for it would be a costly program if adequately carried out. But it must be remembered that the results are fundamental and far reaching and therefore worth while

This country has never lacked courage to carry through commercial enterprises no matter how large. If it can be convinced of the invaluable return sure to result from such an investment in the health of its children, it will not shrink from meeting the necessary expense.

Do not let us forget therefore that illness of his child materially lessens the earning capacity of the industrial worker, and that it often cruelly lessens the child's ultimate fitness for industrial

Adequate supervision of the health of the child will largely overcome both of these difficulties. It is absolutely essential and has already been in operation in many places, so that methods and experience are available. The particular need just now is clearer vision and stronger conviction on the part of the medical profession.

It is to be hoped that the same success may attend all efforts in behalf of this latest fundamental step which has so signally attended the astonishingly rapid progress of the present activities of Industrial Medicine and Surgery

the Study of Breast-Feeding in Minneapolis Transactions of American Pediatric Society, 1920, vol. 32, p. 279 3 Richardson, Frank Howard Breast-Feeding, Past and Future. Archives of Pediatrics, vol. 42, no. 10, October, 1925, p. 651-657 tion, 7 died Two of these cases showed no mastoiditis Two cases treated conservatively died In 8 cases presumably mastoiditis not treated by operation, the mortality was 12 per cent The high mortality of children suffering from cholera infantum is well known and we do not feel that our results are unusually bad. We direct attention to the following conditions found at autopsy in 8 cases

Clinical Diagnosis-Remarks

- Severe active rickets Operation Sudden death Premature infant No operation
- Erysipelas Cholera infantum Operation
- Cholera infantum. Moribund Cholera infantum.
- Cholera infantum.
- Cholera infantum
- tion
- No operation
 - Operation Severe anemia. No operation,
- Empyema. Cholera infantum Pertussis (pneumonia) Opera-

Autopsy

No cause found for sudden death other than rickets Extensive involvement of both mastoids Strep Erysip at autopsy in R. mastoid Extensive necrosis of both temporal bones Cerebral venous thrombosis Mastoiditis Cerebral venous thrombosis Pus in both mastoids Bronchopneumonia

In a word, the causes of death appear to be either profound anatomical changes or serious changes in the function of the tissues with little gross or microscopic alteration. In older infants suffering from malnutrition associated with mastoid infections, operation has invariably been followed by very rapid and permanent improvement.

If then a relatively high mortality is inevitable in mastoid infections in the first months of life, we must direct our attention to prevention rather than to cure Comparison of our cases of mastoiditis with cases of otitis media occurring under two years of age, brings to light one important difference in the two groups. No infant which de-

veloped mastoiditis had received an adequate diet The diet was most often a bad artificial feeding without cod liver oil Surprising as it may seem, some of the infants had been exclusively breast fed, but such infants invariably presented marked clinical signs of rickets and one was premature These children certainly cannot be regarded as adequately nourished. Moreover, dietary inadequacy was present in each infant with otitis media which developed diarrhea and desiccation. On the other hand, 36 per cent of our 22 cases of otitis media under 2 years of age, occurred in well nourished, breast fed infants We may conclude, therefore, that a satisfactory state of nutrition will not necessarily protect an infant against developing otitis media Satisfactory nutrition, however, will prevent offits media from developing into mastoiditis and will prevent otitis media from resulting in serious nutritional disorders series of cases again emphasizes the enormous importance of breast feeding and of proper artificial feeding especially of the type of feeding designed to prevent rickets. The question is still undetermined as to whether rickets in itself predisposes to mastoiditis or whether an associated vitamin deficiency (especially of Vitamin A) may not be the determining factor

Conclusion —In the great majority of infants suffering from cholera infantum and in many suffering from chronic malnutrition, there was obscure infection of the mastoids. In 45 per cent of the former and in all of the latter, operation was followed by cure. Death was not due to the operation per se but to profound pathological changes in the tissues of the whole body vention of mastoid infection in infancy is therefore of the utmost importance. Prevention depends primarily upon proper diet and hygienehuman milk or adequate artificial feeding, and the use of cod liver oil for all infants even if breast fed

tion tissue were found in the antrums. From this time on, the patient made a very steady gain in weight and recovered entirely from gastrointestinal symptoms

W D —Mastorditis with Malnutrition in a Boy Two Years Old -Patient's father is alcoholic Six other children are in the care of charitable organizations The patient was bottle-fed and showed signs of rickets and mental retardation In February 1926, he developed measles followed by bronchopneumonia which had not resolved by the end of March At this time, the patient was entirely "skin and bones" Quantities of pus were draining from both ears and the cervical glands upon the left side were greatly enlarged. The temperature ranged between 104° and nor-There were signs of unresolved pneumonia in the left lower lobe. With adequate diet, the clinical and X-ray signs of pneumonia gradually improved But in spite of this, fever and emaciation continued It was felt that he had a chronic infection of the mastoids This was verified by X-ray examination which showed destruction of the mastoid cells more pronounced upon the left Operation revealed a surprising quantity of pus and granulation tissue in both mastoids, Streptococcus viridans was present. A very rapid improvement took place in the patient's condition He gained 5 lbs in two weeks time, his stools which had been poorly digested became normal in consistency and he left the hospital, 6 wks later, in an excellent state of nutrition

DP-Acute Mastordius, Diarrhea, Desicca-tion, Operation Recovery—The patient, a girl 10 months old, failed to gain on the breast and was weaned at the age of 6 weeks Various formulae were tried without much success until she received whole lactic acid milk In February 1926, she contracted otitis media When she entered the hospital, she was extremely ill with high fever, profuse watery diarrhea and proceeded to lose 2 lbs in weight in three days Glands behind both ears were somewhat enlarged and the posterior portion of the canal walls was sagging incision of the drums, pus was obtained general condition improved somewhat following incision of the drums but high fever persisted and a red area appeared behind the right ear Both mastoids were then opened, pus was found, the hemolytic streptoccus was cultured from the After slight increase in fever, the patient's whole appearance vastly improved and she made a very rapid recovery

RH—10 weeks old, Mastoiditis, Pyloro-Spasm, Malnutrition—Child breast fed only 2 weeks when he was weaned on account of his mother's nipples being sore. He had vomited since that time practically all the formulas tried Sometimes the vomiting had been projectile. The skin hung in numerous folds. Both ear-drums were bulging and pus was obtained upon incision.

The white blood count was normal and the temperature was 94° He was immediately given salt solution and external heat was applied Examination after feeding revealed the presence of typical He vomited considerably after gastric waves practically every feeding. A barium meal revealed the presence of marked gastric retention Five days after admission, he was given a transfusion of blood (3 oz) with marked benefit. The weight continued to fall until operation on the ninth day Pus and granulation tissue were removed from both antrums After an initial rise in temperature, the child ceased to vomit and made a rapid gain in weight

The Diagnosis of Obscure Mastorditis—Every case of severe diarrhea with desiccation should be investigated with regard to the possibility of infection in the mastoids. Dysentery ileocolitis can be diagnosed when the stools contain blood and pus and when a positive culture can be ob-There are, however, certain cases of dysentery without blood in the stools in which the diagnosis is exceedingly difficult. The urine in dysentery usually contains acetone bodies whereas that in diarrhea and desiccation due to parenteral infection usually contains no acetone bodies The most important local signs suggesting mastoiditis in infancy are (1) Otitis media may, however, be extremely slight with only grayness of the ear drums which may appear almost normal when incised, (2) Sagging of posterior, superior wall of the external auditory canal near the drum This sign is of the greatest importance and has not been absent in any of our cases of mastoiditis, (3) Enlargement of glands behind the ear over the mastoid prominence. This is a very frequent occurrence but is not a certain indication of mastoiditis X-ray has been of little value in the diagnosis in children under 6 mos of age owing to slight calcification of the mastoid cells In older children, however, X-ray findings are of more value but even here are of relatively less importance than the clinical picture as a whole

Surgical intervention will depend entirely upon the general condition and not upon the local indications. For example, in severe diarrhea, desication and acidosis in a case with gray drums immediate bilateral operation is indicated. When such a case, however, presents no grayness of the drums and no sagging of the canal wall but has a nasal discharge, it is likely that infection exists in the nasal sinuses and appropriate medical or surgical procedures should be instituted. In cases loosing fluids rapidly, simple myringotomy will frequently be sufficient. In cases of chronic otorrhea with malnutrition, the same rule applies. Operation is indicated if the general condition of the patient as a whole is not improving

The Results of Operative Treatment—Of 11 infants with cholera infantum treated by opera-

EDITORIALS

COUNTY DEPARTMENTS OF HEALTH

The Medical Society of the State of New York has been considering the problem of organizing county departments of health While the question has not been referred to any particular committee, yet that on Public Health and Medical Education would seem to be the most appropriate one to deal with it The subject came up at a meeting of the Committee on December 15th, and it was the opinion of the members that the whole problem was in a state of evolution While various plans had been outlined and some had been tried out, yet no comprehensive plan had been suggested by any of the parties interested in pub-Still, much valuable data has lic health work been collected and many conclusions have been drawn on which there is an agreement among public health workers It is therefore possible to outline public health conditions in New York State, to consider the groups of public health workers, to estimate what has been done in the past, and to review the plans for future work

Public health work has had a natural evolution in New York State. It began with the control of communicable diseases of local towns, villages and cities Home rule has been the foundation of law and custom in New York State, and a sweeping power to prevent contagious diseases has been conferred to the local municipalities This power over contagious diseases has been utilized in the control of water and milk supplies, and the disposal of sewage, and also in that great class of bad housekeeping conditions called nuis-

The State Department of Health was an evolution from the local boards of health, and was developed in order to assist the local boards and to exercise some control over them But in New York State there was no legal provision for a health organization between the local municipalities and the State It was to supply this need that the plan of the county health units was pro-It must be remembered that while the New York State plan was based on the autonomy of the towns and villages, that of some other states is based on the county. Although some of the Southern and Western states have fully organized county health departments, this fact does not prove that they are more advanced in public health work It simply shows they have followed their natural plan of centering governmental functions in the county instead of in the lower communities

Departments of health have often found the people apathetic toward their rules and regulations, and sometimes even hostile Often they had no facilities for carrying on preventative work Hence there arose volunteer organizations of laymen for the purpose of promoting public health Lastly the doctors entered the field of public health work, and through their county medical societies and the State Medical Society, they now take an active part in the practice of public health

At the present time a trinity of public health workers has become fixed in New York State

- The doctors—the county medical societies Departments of health—State and local
- Lay organizations—the State Charities Aid Society and the Parent-Teachers Associations, with their local branches

Each group of the trinity has found itself engaged in some line of public health which has overlapped the fields of work of the other groups, and so there have been disagreements and misunderstandings However, a considerable degree of harmony has resulted in recent years through the functioning of the public health committees of the State Medical Society and of the counties

While public health work up to a decade ago was considered mainly in the prevention of contagious diseases, a new line of public health work has been evolved in more recent years. The control of contagious diseases has been done well by the local departments of health, and in most plans for county health departments, the local boards have been continued and with the same objects that they have always had But with the evolution of the newer public health work, an additional organization is necessary, for experience has shown that towns and villages cannot carry on advanced public health work Cities can do it, and outside of the cities the natural unit is the county department of health

Let us consider the lines of work which are developed in the newer fields of public health The first to be developed were the conditions connected with the mal-nutrition of children, such as scurvy, rickets, scrofula, infected tonsils and teeth, and tuberculosis The public health workers also reached back to the child before birth, and pre-natal work is now a standard public health work procedure in an advanced department of health The public health workers also entered the field of the preventable diseases of adult life-the diseases classed largely are nutritional These include rheumatism, heart disease, diabetes, and Bright's disease Public health workers have thus entered the field embracing almost the complete span of life from pre-natal to old age

A study of the statistics of death and diseases also constitute a modern development of public health work The collection of statistics has usually been left to the departments of health, and the studies made by them have been extensive and complete in most lines of public health work This work will continue to be done by the State. for no other organization is so well fitted to take it over

Physicians are deeply interested in all the newer lines of public health work, but they have not practiced them to a great extent for two reasons

THE MEDICAL NEW YEAR

Sickness is rapidly losing its seasonal character, and the promotion of health is a year-round activity. The physician is on duty every day in the year, and most of the nights, and is always ready to respond to calls for relief from danger and pain. There is no new year in his life of serving the sick, for every day is filled with good deeds and he is always on duty to relieve the suffering.

Yet a new year in the practice of medicine is apparent to those who practiced medicine a quarter of a century ago. The closed automobile brings comfort to the doctor, and relief to his companion, the horse. Instruments of precision take the place of guess work, and science brings certain relief where only blind hope was formerly felt. It is indeed a new year to both the doctor and the patient.

There is no escape from the alternative that physicians must either practice public health or permit the formation of another class of healers

-the professional public health workers

A large part of the activities of the Medical Society of the State of New York consist in developing the practice of public health and civic medicine by county medical societies. This practice is in a stage of development and evolution, and the direction which it will take will affect every physician in New York State. It once threatened to develop into socialism and state medicine in which some doctors would become

servants of political machines, and the people would be victims of exceedingly poor medical practice

The Committee on Public Health and Medical Education is charged with the duty of setting the standards of the practice of public health by physicians. Every doctor in New York State should be interested in its meeting of December fifteenth, an account of which appears on page 37. A reading of that account will explain why a considerable amount of space in every issue of this Journ al is on the subject of the discharge of their civic duties by county medical societies.

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Professor Lorenz — The frequent references to Dr Lorenz in the daily newspapers (seldom in medical journals) even unto the present day, render apropos the following editorial reference to the Herr Professor in this JOURNAL of January, 1903

"The visit of Prof Dr Adolf Lorenz, of Vienna, to New York City during the past month attracted much attention, both from the medical profession and from the laity. That medical men should be interested in seeing the leading exponent of bloodless surgery do his work was to be expected, but that the lasty should evince such an interest was rather surprising, unless one stops to consider the power of the press Professor Lorenz acted in an entirely ethical manner in all his dealings with the profession and the public is a source of congratulation to all those who believe that a Code of Ethics is a necessary part of the Rules of the American Medical As-He sought no interviews, he authorized no insertion of photographs of himself or his work, but was perfectly frank and courteous with the reporters, as every gentleman should be.

His relations with the profession admit of no criticism, but are deserving of great praise saw no patients except upon the request of their family physicians or consultants, and refused to see hundreds of applicants, who offered him thousands of dollars, because in their request for a visit or consultation they did not mention the name of their medical attendant and ignored the proper procedure in such cases When consultations were held he freely and frankly gave his opinion, always giving due credit to the doctor in charge and heartily approving all things that he could, and in a most modest way suggesting any changes he thought necessary or advisable He believed the rôle of a consultant to be that of adviser or guide, not that of critic whose sole interest is to find fault

'It is indeed a pleasure to find a man of whom we can say so much in praise and whose idea is that which this Association is striving for so earnestly and so successfully"

No such praise of the Professor has appeared in a medical JOURNAL since the publication of this fulsome eulogy

1 Patients do not like to go to the doctor for advice to prevent a disease

28

When they do go, they do not follow his advice, from unwillingness or inability to do so

The practice of the newer forms of public health work depends on educating the unwilling, helping those unable to carry out the doctor's advice, and compelling obedience from those who refuse when their refusal is dangerous to others. The doctor needs the assistance of both the State Department of Health and of the lay organizations, for the physicians are willing to supply the medical advice provided the other two organizations are willing to provide the means by which the patients, either individual or community, may carry out their advice

The practice of preventive medicine, public health, and civic medicine is a community problem. While individual doctors will practice this form of medicine in the future when the people are educated to seek their help, yet at present much educational work must be done, and much effort put forth to make it possible for the people to carry out preventive methods. The proposed county health department will go far toward solving the problem of teaching the people to practice the newer forms of public health work.

While much has been said regarding the theory of a county health department in New York State, yet the plan has actually been adopted in only one county—Cattaraugus There the department was organized and financed from outside of the county, and the plan of a large city health department was set in operation, and at the same time the local health departments and the physicians were left to continue their work as formerly The principal work of the county unit has been to practice the more modern forms of public health work by their own agents. The health unit has been a demonstration from outside the county, rather than an evolution of the medical forces within the county

Opinions regarding the success of the Cattaraugus County demonstration are various. On the one hand there are commendatory opinions

expressed by the promoters of the demonstration, of which one series was published in the New York State Journal of Medicine for July 1st, 1926. On the other hand, there was a condemnatory opinion by the Cattaraugus County Medical Society published in the Journal of September 15, 1927. One member of the trinity of public health workers representing the lay organizations, praised the work, one branch of the second member of the trinity, the County Medical Society, felt that the work has not been a success, while the third branch of the trinity of public health workers, represented by the State Department of Health, maintained a neutral silence

Past experience is prophetic regarding the future developments of county health depart-An increasing number of public health workers feel that any county health unit must be the evolution of medical forces within the county, and that the most important member of the trinity health workers in a county is its Moreover, there is a county medical society growing feeling that it is the duty of physicians to assume the leadership in the organization and management of county health departments Neither the individual nor the community can serve two masters There cannot be two sets of medical advisors. If either the health departments or the lay organizations set up the machinery for the practice of public health, it must employ licensed physicians to carry on the work-and two sets of medical advisors are unnecessary The members of the present county societies are well able to manage all forms of public health work in their counties, and experience in several counties of the State has demonstrated the willingness of physicians to undertake the work and to carry it on successfully

There is a growing conviction among the leaders of medical societies, departments of health, and lay organizations that the most desirable way by which county health units may develop is that the public health workers of some advanced county, led by the county medical society, shall establish a health unit fitted to its own needs and evolved from its present organization

COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

The Medical Society of the State of New York promotes all forms of the practice of medicine. There can be but one system of scientific medicine—that founded on investigation and experience. There can be but one standard for the practice of medicine—that proved by scientific research and test. Also there can be but one standard of qualifications to practice medicine—that of the graduate from a first-class medical school.

Physicians feel that the interests of the public demand that they alone shall be permitted to

diagnose human sickness and prescribe the remedies, and that in emergencies, while first aid should be given by any one, yet a physician should be called as soon as possible

If physicians exclude public health workers from diagnosing and treating diseases, then they must make provision to examine their patients and prescribe the treatments. Two classes of patients which were neglected a generation ago must now be treated by physicians.

I The case that is mild or incipient

2 The community in matters involving health

sorb 20 to 30 mg of nicotine—enough to produce a profound psychological effect, though, administered in this way, ten to fifteen times under the lethal dose. The amount of nicotine in cigar and pipe-smoking Cyanides and sulphocyais much higher nides are present in traces, and arsenic, Dixon says, is a constituent of American tobaccos in amount many times greater than that permitted in foods Tobacco-smoking has a definite action on the alimentary canal cording to Hurst, it causes hyperchlorhydria and favors the production of duodenal ulcer, and Wagner also insists that it can produce all the subjective and x-ray appearances of The considerable use of this condition tobacco in any form invariably produces an increase in pulse rate and a slight rise in blood pressure It sometimes produces palpitation and arrhythmia, especially in the young, these symptoms disappear if smoking is stopped In older persons it may produce anginoid pain There is a clinical consensus of opinion that immoderate smoking favors arteriosclerosis Tobacco has a sedative effect in conditions of irritation, and a stimulating effect in those of weariness and depression Its action on the central nervous system, on the whole, apparently does no Addiction does not occur in the sense that this term applies to heroine and morphine, though during periods of abstinence the smoker feels the want of the customary narcotic effect. The experiments of Lee and Dixon concerning the development of tolerance to tobacco show that repeated injections of nicotine into an animal gives to the tissues and especially the liver, an increased power of destroying the toxicity of this alkaloid, the process being probably in the nature of a ferment action It may well be that, living in a civilization such as ours, the ordinary man shows in his nervous responses variations from the normal, and on such tobacco may exert a beneficial action The vital question which requires an answer is to what extent the use of tobacco in strict moderation leads to vascular degeneration -British Medical Journal, October 22, 1927, 11, 3485

Thyroxin in Endocrine Disorders—A Schittenhelm and B Eisler of the Kiel University Medical Clinic, have made numerous tests of this active principle, in part with the purpose of comparing its action with that of thyroid tablets. In one woman of 30 years with precordial spasms, fainting attacks on slight excitement, insomnia from palpitation of the heart, great weariness, etc., with rapid taking on of fleshwithyroxin was firstingiven. The

woman lost a little weight and her basal metabolism, which had been minus 2 per cent rose to plus 3 per cent There were no unpleasant effects from the medication and this was continued until all symptoms vanished With the idea of continuing the treatment the authors then substituted thyroid tablets which quickly brought about a hyperthyroid syndrome tachycardia, palpitation, vertigo, prompt fatigue on exertion After about three days with these symptoms the patient's condition righted itself and thyroxin was then substituted for thyroid This mild yet active behavior of the former cannot be accounted for save on the supposition of a sensitizing component of crude thyroid not present in The smooth action of the latter is thyroxin not always seen after intravenous injection and now and then we must expect undesirable collateral activity. In one case in which intravenous thyroxin exerted a brilliant action on pronounced myxedema, diabetes occurred which did not subside on discontinuance of the drug The drug also produced fever, malaise, headache, and vomiting The possibility of accurate dosage with thyroxin makes the latter superior to thyroid substance in obesity, for the results obtained from the latter are inconstant. The same may be said of so-called benign hypothyroidism Symptoms referred to this origin are somnolence, headache, stenocardiac attacks, and numerous others varying much with the case -Klimsche Wochenschrift, October 8, 1927

Intermittent Claudication and Its Treatment by Diathermy - In a study of the etiology of intermittent claudication, A Wilson Gill and L Newell Moss (Lancet, October 29, 1927, ccxiii, 5435) find that although the cause is unknown, a great deal of stress has been laid on the importance of tobacco as a factor Other supposedly etiological factors include alcohol syphilis, gout, diabetes, infectious disease, tea, coffee, and the stress and strain of life The treatment of intermittent claudication in the past has been far from satisfactory Recently diathermy has been tried fairly extensively and apparently with great success, because of its vasodilator effects on the small arteries and capillaries In addition to diathermy, general hygienic measures should be carried out, foci of infection should be removed, and abstinence from tobacco should be insisted upon. The authors cite a case in which the regular treatment by potassium iodide potassium nitrate, nitrites, Bier's congestive treatment, and the drinking of two quarts of modified Ringer's solution daily was ineffectual With the onset of cerebral symptoms it was decided to try diathermy Exposures were given lasting 30

MEDICAL PROGRESS

A New Operation for Drop-Foot -C Lambrinudi, writing in the British Journal of Surgery, October, 1927, xv, 58, describes an operation which controls drop-foot even though the gastrocnemius is active and power-By this procedure the only joint arthrodesed is the subastragaloid A J-shaped incision is made, starting 4 inches above the external malleolus, close to the posterior margin of the fibula, carried down below the external malleolus, and ending at the center of the middle metatarsal bone. The dissection is carried down to the periosteum, so as to expose the front and back of the ankle, great care being taken to leave intact the anterior and posterior ligaments of the anklejoint itself. The peronei are divided low down The astragaloid joint is and dissected up opened, and the knife is carried under the head and neck of the astragalus into the front part of the subastragaloid joint The interosseous ligament is then divided, and the knife carried into the posterior compartment of that joint The soft parts are dissected from the inner side of the astragalus, and the cartilage is removed from the upper surface of the os calcis and the lower articular surface of the astragalus, and a notch is made horizontally from side to side in the posteriorinferior aspect of the scaphoid. The head of the astragalus is depressed to its utmost limit, and the neck is sawn through in the direction necessary to set the foot at the de-The foot is next dorsiflexed, so that the cut surface of the neck of the astragalus lies on the upper surface of the os calcis, and the sharp anterior margin fits into the notch made in the scaphoid. The angle between the articular surfaces of the os calcis and the astragalus is now filled up by a graft taken from the excised head and neck of the astragalus, this is designed merely to increase the anteroposterior thickness of the astragalus when placed in this practically vertical The first essential to success with this operation is that there shall be good power in the gastrocnemius muscle procedure has given completely satisfactory results in 7 of the 9 cases in which it was employed

Etiology and Serum Therapy of Hyperacute Appendicitis — Hilgermann and Pohl speak of the cumulative incidence of foudroyant appendicitis in the region of Deutsch-Krone where a large back country is served by the City Hospital with very poor transpor-

tation facilities Sometimes several cases are admitted in rapid succession Four cases came in from the local barracks in 20 days and within a week an assistant and nurse of the hospital were smitten. This sort of incidence suggests an epidemic and as a matter of fact most of the cases seemed to represent a metastasis of appendicitis secondary to angina In six months ending last February, 156 appendectomies were performed and in 107 the appendix was severely infected, 37 being examples of total gangrene and 22 others phlegmonous with free suppuration of the In ten patients there were several peritoneum general symptoms in the earliest stage of appendicitis Cultures showed that the pneumococcus was the chief offender among organisms with the streptococcus rather a poor second and other bacteria scattering does not seem that these severe acute cases should be left entirely to surgery without any attempt to give internal medication and the authors have sought to make routine use of a polyvalent serum prepared from pneumococci and streptococci The authors state that they lost but 3 out of 22 cases in which peritonitis of severe character had developed 10 cases everything pointed to a hopeless out-It is to be hoped that whenever a bacteriological diagnosis is possible the custom will become common of prompt injection of a specific serum based on this diagnosis The authors have found the bacillus of diphtheria present in a few cases and have then injected diphtheria antitoxin. Another means of identifying the nature of these cases is the angina so often present, which permits study of the bacterial content - Munchener medizinische Wochenschrift, October 7, 1927

The Tobacco Habit - In the Norman Kerr Lecture delivered before the Society for the Study of Inebriety, W E Dixon states that tobacco contains ammonia gas and pyridine or pyridine derivatives, and it is these substances which produce the irritation of mucous surfaces not infrequently observed in smokers, these bodies are responsible for the morning cough, the irritation of the throat and tongue, and the conjunctivitis of the cigarette smoker If these products could be excluded it would be to the benefit of the smoker Other dried herbs, as for example, coltsfoot leaves, once sold as a boy's tobacco, often produce more pyridine when allowed to smoulder than tobacco If a cigarette smoker were to puff ten cigarettes on end he would certainly ablike 99 per cent as the frequency of achlorhydria in Addison's anemia Achlorhydria allows the small intestine to become infected with swallowed bacteria and permits colon bacilly to invade the stomach Furthermore. the abnormally alkaline contents of the small intestine in achlorhydria form a particularly good culture medium In all patients with achlorhydria prophylactic measures against pernicious anemia should be instituted. These consist in the elimination of dental and nasopharyngeal sepsis and the constant use of hydrochloric acid Since achylia gastrica is often familiar, the near relatives of patients with Addison's disease and subacute combined degeneration of the spinal cord should have test meals and, if they are found to have achylia, should take acid for the rest of their lives The commonest cause of paresthesia of the feet and hands is subacute combined degeneration of the spinal cord These symptoms should at once suggest the desirability of giving a test meal and examining the blood discovery of megalocytosis strongly points to a positive diagnosis The treatment consists of the removal of foci of infection and the administration of large doses of hydrochloric acid Patients should be instructed to take 2 drachms of hydrochloric acid to a pint of water, to which the juice and pulp of an orange or other fruit and some sugar have been added should be drunk one hour before breakfast, at lunch and at dinner To prevent deleterious action of the acid the mouth should be washed as soon as possible with a weak solution of sodium bicarbonate A vaccine prepared from bacteria isolated from the duodenum should be administered, beginning with small doses and increasing very slowly The anemia should be treated by transfusion, arsenic, and diet The author's experience with the liver diet fully confirms the results obtained by Minot

The Silent Gap in Auscultatory Estimations of Blood Pressure -Paul C Gibson, writing in The Lancet, November 12, 1927, ccxiii, 5437, describes the silent gap in the ascultatory curve, which was first noted by Tixier about six years ago, and which under the term "trou auscultatoire" has had full recognition by French physicians The sounds of the auscultatory sequence can be more or less clearly divided into four zones, following one another in a continuous series (1) Constant in type and in extent, of short duration and easily missed as the sounds are soft and dull, the first sound in this zone marks the systolic (2) Variable in extent and in quality, the sounds being like murmurs (3) The sounds are loud and slapping and increase steadily to a maximum, when they suddenly change into minimal sounds (4) Short, dull sounds, usually of brief duration The silent gap always occupies the second zone, which it more or less replaces, sometimes appearing nearer the upper extremity and sometimes nearer the lower It may extend over a range of 20 to 60 mm Hg An important characteristic of the phenomenon is that when the sounds emitted by the compressed artery have ceased to be audible, the movements of the arterial wall below the armlet, as measured by an oscillometer, show no abatement, and the pulse wave may easily be felt at the wrist Gibson analyzes four cases in which a silent gap was noted to find, if possible, the clinical significance of this phenomenon, and concludes that, for the present, all that can be said is that the silent gap is in some way associated with hypertension, its bearing on diagnosis and prognosis still remains to be determined It is, however, undoubtedly a serious source of error in sphygmomanometry and sometimes accounts for great discrepancies in readings To avoid this source of error, after applying the armlet, the compression is rapidly raised to about 250 mm Hg, and then allowed to fall slowly and steadily while the observer listens with his stethoscope over the brachial artery at the lower margin of the armlet

Cerebral Manifestations of Cardiac (Left Ventricular) Insufficiency—A Dumas reports in detail nine cases of this heart lesion from which he draws the following conclusions. In association with the acute edema of the lungs which develops in these cases we often see nervous manifestations which dominate the clinical picture, so that the edema passes un-Moreover in hypertensive subjects the sudden lowering of the tension may likewise provoke nervous accidents of the same The author refers particularly to convulsive and syncopal attacks These convulsions might at first sight suggest uremia, but blood urea will be found in a proportion which is at least not much elevated. The fact that edema of the lung is present as a result of cardiac insufficiency indicates that the systemic circulation must also show a deficit and this is further complicated by the sudden lowering of tension, so that the cerebral centers are responsible for various symptoms Edema of the lungs also causes defective aeration of the blood, so that a third source of disturbance is added. The cerebral symptoms described in the author's cases include vertigo and there is some resemblance to the convulsions and other symptoms seen in heart block, etc -included under so-called cardiac epilepsy -although the author does not mention the latter condition -Le Journal de Médecine de Lyon, September 20, 1927

minutes, the maximum current used being 1,000 milliamperes At first treatment was given twice a week, but later the seance was repeated daily for 20 days Improvement was noted from the first, both in the general wellheing and in the local effects. Up to the present time no further attacks have occurred and the general health remains at a high level Lian and Descoust emphasize that strong currents are not necessary and advise 1200-1500 milliamperes If the plates are sufficiently large there is probably nothing to be gained by having one plaque over the seat of the arterial block, since the blood carries superfluous heat to the rest of the body

The Pathology of Charcot Joints-In the course of animal experiments Willis John Potts (Annals of Surgery, October, 1927, lxxxvi, 4) confirmed the work of Eloesser showing that, in addition to changes in the central nervous system, trauma is an essential factor in the development of typical neuroarthropathies Both atrophic and hypertrophic changes in the articulating bones have been described, one author claiming atrophy, another hypertrophy as the predominating pathological change Potts states that Charcot joints present variable pathological pictures depending upon the time of observation cites various cases, some illustrating the stage of atrophy, others the stage of sclerosis and hypertrophy, and one case illustrating both conditions in the same joint. While the knee is the most common site of neuro-arthropathy, any joint in the body may be affected, but the two conditions must obtain - a change in the sensory nerves and trauma. As long as the existence of trophic nerves is unproven, there is no reason to believe that this condition is due to anything but the destruction that must follow in a joint without its protective mechanism When the bones are deprived of the accurate weight-distributing power of the muscles and of the stabilizing protection afforded by an intact nervous system, minor stresses result in damage For this reason so-called spontaneous fractures in On this hypothesis tabetics are common neuropathic joints are simply changing pictures of destruction and erosion and nature's attempt to stop the process by sclerosis and repair the damage by building up new bone Because of the painlessness of the onset, the condition is rarely seen before marked bone changes have occurred The roentgenographic findings are of prime importance The first deviations from normal are increase in the joint space due to ligament relaxation and wearing down of the articular cartilage, roughening of the joint margins due to marginal fractures and joint lipping Occasionally an intraarticular fracture is the first evidence of neuroarthropathy. As the process advances sclerosis of the bone ends appears in the roentgenogram and bony islands formed from loose fragments appear in the joint and its capsule, later, complete disorganization follows

A New Sign of Pregnancy—Dr B Lorinez who has charge of a maternity institute in New Pest, Hungary, refers to an induced symptom provoked by pituitary extract, first reported by Hohne and Zorn as a sign of early gestation in 1926 If this extract is injected into the veins of a pregnant mother in the early months the fingers soon perceive slight contractions of the normally soft and relaxed womb. In from 10 to 20 seconds after the injection the entire organ becomes hard, firm and solid as a stone Before making the test, the bowels and bladder having been evacuated, the uterus must be carefully palpated in all available ways The drug is then injected into the cubital vein in dose of 1 cc, with the examiner's fingers in position The contractions having been perceived the fingers remain in situ and in certain spaces the hard tissues relax giving the uterus an uneven feel anywhere from 1 to 5 minutes the contractions begin to give way and soon the effects of the drug disappear The author has tested over 50 women thus far and is making new examinations almost daily There have been no bad effects on the uterus itself and the women mostly have no untoward results from the injection, although now and then he saw pallor, malaise, etc. The women were all asked to return in a month, but only 20 did so, and every one of these was found to be pregnant by other tests But one woman, a multigravida, failed to react to the injection although later shown to have been pregnant at the time The test is not only of value in the early months but whenever there is need of a differential diagnosis The author seems to have made no real addition to the work of Höhne and Zorn and no one seems to have preceded them in the discovery But Winter, it must be recalled, first discovered the general law that in a pregnant uterus in the early months local contractions followed by relaxation may sometimes be felt and that this is the surest sign of gestation—Munchener medizinische Wochenschrift, September 25, 1927

The Pathogenesis, Prophylaxis and Treatment of Pernicious Anemia—It is the belief of Arthur F Hurst (British Medical Journal, October 15, 1927, 11, 3484) that achylia gastrica is the one essential predisposing cause of Addison's disease and subacute combined degeneration of the spinal cord. The collected results of various investigators give something

arrested, 30 convictions were secured, 14 of the cases resulted in acquittal or dismissal, there are now 58 cases arrested and pending trial and there was one death before trial "Curiously enough" says Dr Rypins, "there is no one special group of illegal practitioners found either on investiga-They are tion or by classification of arrests widely distributed among chiropractors, naturopaths, physicians without licenses, foreign physicians who cannot obtain licenses, faith healers, druggists, laymen, herb doctors, naprapaths, bone setters, and licensed practitioners in the lesser allied fields of optometry and chiropody"

The result of all this work is that upwards of a thousand medical quacks and charlatans have been driven, during the past twelve months, from the state of New York, and the unauthorized use of the title "doctor" either by signs or on advertising literature has practically ceased more eloquent commentary on these activities can be found than in the bitter complaints which have come from officers of Pennsylvana, New Jersey and the Canadian provinces that the New York quacks have folded their tents and in large numbers are now found in those regions where quack-

ery is less sternly dealt with The report further speaks of the progress

which has been made in the control of physiotherapy But not the least interesting discussion contained in this valuable paper relates to the inauguration and operation of the Grievance Committee under the very able chairmanship of Dr Orrin Sage Wightman All and more than was predicted for this Coinmittee apparently is coming true. It serves to protect both the public and the profession Those with grievances have a forum in which to present them and are displaying a confidence in the decisions rendered These accusations against physicians are heard and determined and finally disposed of on the merits, thereby no doubt to a large extent, cutting down the likelihood of civil malpractice actions arising out of these complaints writer has been particularly interested in watch-

ing the working out of this feature of the bill

He has had many personal talks wth Dr Wightman on the subject and was the means of bringing Dr Wightman in contact with Mr Einar Chrystie, the attorney for the Grievance Committee of the New York Bar Association by conference and correspondence, Dr Wightman sought to derive all possible advantage from the experience gained by the Lawyers' Committee engaged in this similar line of work. In other ways your counsel has been familiar with the pains to which the Grievance Committee has gone to equip itself with the requisite knowledge in order understandingly to conduct the work which the statute has imposed upon it

In many other ways the progress of your Society during the past year has been notable Society especially has taken a position of strong leadership in relation to the public health it has been of incalculable worth in the distribution of medical knowledge through its Committee on Public Health and Medical Education system of graduate education by which instruction was taken to the doctors in the rural counties has been strengthened and carried on strides also have been made in the field of preventive medicine as illustrated by the success of the anti-diphtheria campaign, and the dissemination among the lay public of knowledge as to the protective value of toxin anti-toxin To an increasing extent there has been co-operation between the laymen and the physicians toward the elimination of the dread scourge of diphtheria

Let us face the new year then with confidence in the future Let us appreciate how great are the results of the combined efforts of your Society members and the indefatigable zeal put forth by your officers and committees The eyes of the country are turned upon New York State. especially is this true in the medical field than ever the New York State Medical Society has become an instrument for progress, for the good both of its members and of the lay public, and for the advancement of the great profession of the healing art

TONSILLECTOMY AND ADENECTOMY—DEATH

An administrator's action was instituted to recover for the death of his decedent claimed to have been caused by the alleged negligence of a The complaint charged that the deceased had been advised by his family physician to have his tonsils removed as a preventative of possible ailments, that shortly thereafter he presented himself to the defendant physician who specialized in operations of this nature charged that the defendant was engaged to perform a bloodless operation, it being claimed that he guaranteed the avoidance of a drop of blood It was further charged against the defendant

physician, that by reason of his improper treatment and negligence the deceased became sick, which resulted in the violent illness and death of the deceased

By LLDYD PAUL STRYKER, Esq. Counsel, Medical Society of the State of New York

THE NEW YEAR

In wishing to the medical profession a useful, a happy and a prosperous New Year, the writer in taking stock of what has gone before, feels confident that never in the history of the New York State Medical Society has there been a more undoubted basis for a just pride in what the medical profession of this state has accomplished, nor a firmer foundation for an intelligent optiinism of what the future holds in store

So rapid is the march of events in the busy, crowded lives which this feverish civilization causes all of us to lead, that in the onrushing train of time we sometimes fail to look out at the stations we are passing and only when the route is traced, appreciate the rapidity of the journey and the definite destinations we have attained

The writer recalls with infinite interest and now more than ever with a just pride the concentrated efforts put forward by this Society and its indefatigable officers and committees in furtherance of the preparation and the final enactment of the Medical Practice Act, under which not only the practice of medicine is regulated, but new safeguards of the public health are definitely set up

Our Journal for December 15th, 1927, contained an extremely valuable and highly interesting article by Dr Harold Rypins, the Secretary of the New York State Board of Medical Examiners, entitled, "First Year of the Medical Practice Act" This article was first laid before the Society of Medical Jurisprudence on December 12, 1927, and its reading was widely referred to with approval by the lay press throughout the The article is a conservative analysis of the work done and a careful statement of the conclusions which not only can be, but must be drawn from the experience derived from the first year of the operation of this law This measure, like all enactments of a far-reaching nature, was the product of the thought of many minds and was both ardently sponsored and opposed by those who believed and those who did not believe in the efficacy and propriety of its terms

The prognosis made by the advocates of the bill, like all forecasts, was necessarily somewhat speculative, despite the fact that the predictions for its success were put forward by those who had devoted days and weeks of study to the problem with all of their intellectual integrity favorable prognosis so sedulously expressed by all the friends of the measure, before the various legislative committees, the executive of the state,

within the editorial and news columns of this JOURNAL, and in the lay press, is more than jus-Happily, the forebodings of those not in sympathy with the measure have not been fulfilled

The general objects of the proponents of this legislation were briefly and accurately classified by Dr Rypins as follows

1 To drive out illegal quacks and char-

To create a Grievance Committee

(a) To discipline licensed physicians (b) To dispose of complaints against licensed physicians where no adequate cause of action is present

To establish and regulate the profession

of physiotherapy

To set up permanent administrative machinery for the enforcement of the

(a) To compile an annual, accurate registry of physicians

(b) To raise sufficient funds for the proper administration of the act

Dr Rypins asserts and then conclusively establishes "that a year's intimate association with this matter has satisfied the Department of Education, upon which the burden of this administration largely falls, that the act is doing at least as much, if not more, than was expected of it"

The Medical Practice Act is administered by the State Board of Medical Examiners under the supervision of the First Assistant Commissioner of Education, with the assistance of two fulltime deputy attorneys-general, a bureau for the handling of annual registration and a force of from five to seven full-time inspectors and the necessary clerical help

The \$36,000 derived from the annual registration fees of the physicians is a fund just about adequate for the carrying on of this valuable and as is now seen, indispensable machinery set up for the purpose of enforcing the provisions of the "It has been said" writes Dr Rypins, "that the object of this legislation was to put teeth in the Medical Practice Act Even more so, it was to create an organism which would intelligently and forcefully manipulate these teeth" With the direct aid of the attorney-general of the state and the able assistance of the various district attorneys, especially those in the greater city, during the past year 103 illegal practitioners were

NEWS NOTES

COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

A meeting of the Standing Committee on Public Health and Medical Education was held in New York City on December fifteenth morning session was held in the rooms of the State Medical Society in the building of the New York Academy of Medicine, 2 East 103rd Street, and a dinner and afternoon session was held in the Hotel Roosevelt, 46th Street and Madison Avenue There were present Dr Thomas P Farmer, Syracuse, Chairman, and Drs Chandler, Longstreet, Stanton, Polak, Greene, and Kosmak There were also present as guests Dr James E Sadier, President of the Medical Society of the State of New York, and Dr J S Lawrence, Executive Officer, Dr Frank Overton, Executive Editor of the New York State Journal of Medicine, and Dr Frederick P Reynolds, Assistant Secretary of the New York Academy of Medicine, representing the educational work of the Academy

The Committee has a dual function public health phases of its work were considered in the morning session and its educational work in the afternoon The discussions were full, free and friendly, and included all the activities of the Committee and their reception by the physicians and the public The Committee has been at work along the present lines for three years, and has developed its plans as they were indicated by the local needs of the County Medical Societies A high average of efficiency was shown by the reports of work done and by requests from County Societies that the work be extended into their districts

Five public health activities were discussed in the morning session 1, county health departments, 2, better maternity practice, 3, anti-diphtheria work, 4, child health consultations, and 5, orthopedic clinics

Regarding the movement to establish a county health department in every county, the members of the Committee with one accord asked, "What is a county health department?" The answers to this question were many and various and often conflicting (See Editorial, page 27)

The discussion of the county health department was confined to the plans which had been undertaken or announced, and the opinion of the members was that the whole movement was in a state of evolution in which an attitude of watchful waiting seemed to be assumed by all who are interested in public health

Dr E M Stanton moved that a sub-com-

mittee of four be appointed to study the problem of the county health department. This motion was carried unanimously

Better Maternity Practice was the second subject that was taken up Dr Farmer quoted Health Commissioner Nicoll as saying that the maternity death rate had declined 36 per cent in rural districts, but had risen 36 per cent in the cities Dr Polak said that the increase in New York City was among patients in private maternity hospitals which were unlicensed and uncontrolled Dr Sadlier said that the subject of the last meeting of the Tri-State Conference of New York, New Jersey and Pennsylvania had been the control of private hospitals, and that a committee of one from each State had been appointed to suggest a law on the subject

On motion the Committee voted that a subcommittee should study the subject

The third subject considered was the antidiphtheria campaign The discussion largely on the comparative merits of two plans which were conducted in Schenectady and Kings-Each city entered heartily into the plan that was devised by themselves, and the lay health organizations of both cities assisted the doctors in a satisfactory way with money, influence, and automobiles Kingston concentrated on free clinics for the school children and gained the advantage of a brief campaign with its attendant Schenectady did an extensive educational work in order to prepare the doctors to give the immunizations, and the people to seek them The physicians agreed on a satisfactory scale of prices with provision for free immunization to those unable to pay for it.

Both Kingston and Schenectady will require more money in order to conduct their educational campaigns, and the doctors of both cities will continue their interest in the immunization. The members of the State Committee on Public Health and Education unanimously agreed on the advisability that each city should continue its work in order that time might demonstrate the results of the two contrasting methods of conducting the anti-diphtheria work.

The subject of Children's Health Consultations was discussed only briefly, for the Committee recognized the success of the present system that the County Medical Societies should manage them in co-operation with the State Department of Health, after the plan of St Lawrence County

Help to crippled children was briefly discussed, and the assistance of the State was mentioned.

36 LEGAL

formance of the operation, the doctor was as-Upon completion of the opsisted by a nurse eration, which was uneventful, the child was brought into the physician's rest room and placed on a hospital cot about twenty minutes after the operation had been commenced. He came out of the ether in about an hour and talked with his mother and those present. About three hours after the operation the child was sitting up The physician then left his office to make his While at the hospital he received hospital calls a telephone message from his office to the effect that the child was not doing very well physician immediately returned to his office and found the child in a weakened condition, with a poor pulse and no bleeding. The defendant physician and his assistant applied stimulants by subcutaneous injections of strychnine and digalin and also administered adrenalin direct into the heart muscles Injections of normal saline solutions were given subcutaneously. By the admin-

istrations of the medication the heart was stimulated for about an hour and a half, when the

heart suddenly stopped beating

The physician felt that the death was not the result of the operation as there were no hemorrhages during the performance of the operation or after. He also felt that the death might have been caused by an enlarged thymus. Several hours after the performance of the operation, the physician states that he was advised by the child's mother that about two weeks prior to the performance of this operation, the child had had a severe nose bleed which could not be stopped for thirty-six hours and that the child was a bleeder and that the whole family were bleeders. However, the defendant had no knowledge or notice of this fact prior to the performance of the operation.

During the pendency of this action, the defendant physician died, the action thereby abating

with his death

CLAIMED NEGLIGENT REMOVAL OF THE UVULA DURING TONSILLECTOMY

In an action brought against a hospital and an attending physician at such hospital, it was charged that on January 31st the plaintiff had submitted himself to treatment for the purpose of having an operation performed upon his ton-He charged that the hospital held itself out as competent to advise the plaintiff with reference to such operation, and assured and warranted to the plaintiff that the operation performed upon him would be done by skillful That he and competent servants of the hospital paid a fee to the hospital for such services and by the person in charge was directed to the defendant physician to have the operation per-That the operation was carelessly and negligently performed and during the course of the operation other organs in the plaintiff's throat were removed, which caused him to suffer extreme torture, inability to properly digest and to masticate, causing him at times to choke further claimed that he suffered great pain in his throat, suffered the loss of blood and spells of dizziness and was prevented from following his usual occupation

The hospital was a charitable not-for-profit corporation and had exercised reasonable care and diligence in the selection and engagement of its various physicians, nurses and other at tendants. The physician who was made a party defendant in the action was one of the examining physicians in the throat clinic of the defendant

He examined the plaintiff and advised him that he ought to have an operation on his When the plaintiff returned to the hospital on the day set for the operation the defendant physician was not in attendance at the clinic Another physician who was in attendance examined the plaintiff and found his tonsils inflamed Plaintiff was then placed upon the operating table and under an ether anaesthesia his tonsils and uvula were removed The hemorrhage subsided within a short period of time. The patient was placed in bed and kept under observation during the night There was no recurrence of the hemorrhage and the plaintiff left the hospital on There was no complaint the following morning made by the patient until the institution of this action many months later It was instituted on behalf of this patient, charging that there was no necessity for the removal of his uvula and damages were sought to be recovered for the alleged negligent removal of the uvula

The physician who operated upon him, not the defendant physician, stated that the condition of the uvula was such that it was absolutely necessary to remove the same in order to relieve plaintiff's condition and to prevent serious

result

The action came on for trial and after submission of the plaintiff's proof, the court dismissed the complaint, terminating the action in favor of the defendants

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at The Bronx Professional Building, on November 16, 1927, was called to order at 9.20 P M, the President, Dr Friedman, in the chair

The following physicians were elected to membership Isidore Fischer, Edward Mandell, Henry Matez, David L Milliken, Arthur Schmorr

Dr Boas, for the Committee on Public Health and Medical Education, appealed to the members for further co-operation, with special reference to the folders advocating Periodic Health Examinations

Dr S M Jacobs reported on the efforts of the Building Committee during the past year

Dr Henry Roth, for the Relief Committee, reported that thus far there has been no need

for giving relief

Dr Weitzner, for the Social Committee, reported that the Committee, as instructed by the Society, is arranging a Beefsteak Dinner to be held on Thursday evening, December 15th, and urged all the members to attend the Dinner

Under Unfinished Business, the Secretary proposed the following Amendments to the By-Laws recommended by the Comitta Minora, Section

II—Standing Committees—Add.

" , a Committee on Public Relations of five members , * * *"

COMMITTEE ON PUBLIC RELATIONS

Section 81 (a)—The Committee on Public Relations shall cooperate as far as practicable with

the welfare and health agencies operating in Bron County It shall be guided by the suggestions of the Standing Committee on Public Relations of the Medical Society of the State of New York"

It was announced that the proposed Amendments will be printed in the December issue of The Bulletin and will be acted upon at the December meeting

The recommendation of the Comitia Minora, that a Resolution be forwarded to the Mayor suggesting that some plan be devised so that a freer use of the hospital facilities be accorded to those physicians working in the dispensaries and who are connected with the hospitals in other capacities, was then brought up for the consideration of the membership. It was moved and carned that this Resolution be approved

The Scientific Program proceeded as follows

Case Reports

"Three Cases Illustrating Some Unusual Manifestations of Tuberculosis—X-Ray Films," by Jacob Segal, M D

Papers

1 "The Clinical Diagnosis of the Various Types of Nephritis," by Wm Weinberger, M.D.

2 "Surgical Aspects of Borderline Thoracic Diseases, with Special Reference to Pulmonary Suppuration," by Harold Neuhof, M.D.

I J LANDSMAN, MD, Secretary

GREENE COUNTY

Special meeting of the Greene County Medical

Society at the Saulpaugh Hotel

Vice-President Persons called the meeting to order at 9 P M There were present Drs Honeyford, Branch, Goodrich, Atkinson, A O Persons, Van Hoesen and Rapp Dr Laidlaw, District State Health officer, and Dr Joseph S Lawrence, Executive Officer of the Medical Society of the State of New York were guests

The minutes of the last meeting were read for

information only

Dr Honeyford, chairman of the Hospital committee, reported that he had talked with one of the lay committee as to the progress that was being made, and that he replied that it was thought that the time was not opportune to start a drive for funds and so the matter was quiescent.

Dr Laidlaw, District State Health Officer, was introduced and expounded very thoroughly the proposition of employing two general nurses for the county instead of the one now employed, they

to be supervised by a committee composed of physicians and supervisors, and applying to the state for the expenses of one of them under the State Aid to Counties act.

Dr Lawrence also discussed the project and

urged its enactment

Dr Branch moved that the Chair appoint a committee of three members of the Society to appear before the Board of Supervisors at their present session and request the appropriation of sufficient funds to employ two nurses for the County It was seconded by Dr Honey ford and unanimously carried.

The Chair appointed Drs Branch, Daley and Van Hoesen Dr Honeyford moved that Dr A O Persons be added to the committee It was seconded by Dr Van Hoesen and carried Adjournment to the regular meeting in January was then moved by Dr Branch and seconded by Dr Goodrich and carried W M RAPP,

Secretary

NEWS NOTES

especially the appointment of four regional consultants in orthopedics whose services were available to physicians for the diagnosis and treatment of cases of crippled children. The suggestion was made that County Medical Societies should take an interest in the children when public provision for their diagnosis and treatment are needed.

The educational work of the Committee was discussed in considerable detail in the afternoon, with special reference to the counties in which the courses should be given. The Committee spent a large amount of its time in reviewing outlines for courses, with proposed lecturers for the same courses, which had been submitted by several teachers in the various medical colleges of the State, and that it was the opinion that these courses were most ideal, that they covered a large part of the field of medicine, and that the lecturers suggested were men most qualified to do the work

The methods of giving the courses were also discussed, especially the nature of the lectures and demonstrations. Their object is to enable physicians to improve their practice of scientific medicine. More knowledge of interesting facts is not sufficient—it is essential that the facts be such as the average physician can use

There is difficulty in devising a lecture which combines the three features of science, attractiveness, and practicality. The members of medical societies are not medical students who are compelled to adjust their thinking to that of their teachers. The obligation is the other way around—the lecturer must adapt himself to the habits of thought of the audience. Hence the qualities of attractiveness and clearness are essential in a lecturer or a teacher sent by the Medical Society of the State of New York.

Lecturers sometimes assume that the doctors know more than they really do A lecturer may adopt the device of giving a brief review of the elementary scientific principles on which his teaching is founded, thus giving his audience a subtle compliment

Talking "above the heads of the audience" is not conducive to either attendance or interest Doctors have a right to expect that instruction will be offered to them in a manner that is simple, clear, and interesting

The discussion of the Committee centered around two broad topics 1, the subjects of the lectures, the agreement being that they should meet a definite problem such as the reduction of maternal mortality through better obstetrics, and 2, The personnel of the teaching and lecturing staff, the Committee asking the co-operation of the physicians in securing those whose abilities are known and tried

Dr George W Kosmak said that some of the national medical bodies have committees to study teaching methods and to devise courses of instruction for doctors. The American Society of Obstetricians and Gynecologists has such a committee and is prepared to furnished concrete suggestions to State Medical Societies regarding courses of lectures and the personnel of the lecturers. These committees know the sources of success and failure in the practice of obstetrics and gynecology, and are prepared to give the doctors what they need and in a way that will impress the hearers.

The impression of those attending the meeting of the Committee on Public Health and Medical Education was that the three years of experience in pioneer work has demonstrated both the need of the work and its popularity among physicians throughout the State

TRI-COUNTY SOCIETY MEETING

A union meeting of the three medical societies of Orange, Ulster, and Dutchess-Putnam was held in Kingston, N Y, on the evening of Tuesday, November 22nd, with 64 physicians and 3 county judges present

A special supper was served, and good fellowship prevailed throughout the evening The toastmaster, Dr George F Chandler, introduced

the speakers

Dr Robert T Morris, of New York City, spoke on the Four Eras of Surgery—the Heroic, the Anatomic, the Pathologic and the Physiologic

Judge William D Cunningham spoke on the Relations Between the Legal and the Medical Professions in Local Communities

Professions in Local Communities
Dr James E Sadlier, President of the Medical
Society of the State of New York, spoke on two
phases of the work of the State Society—that of
graduate education and the correlation of the
medical work of lay organizations with that of
the family physicians

This, the second joint meeting of the three medical societies, was unusually successful in bringing together representative medical men from the Central Hudson Valley

pathy I hope Waterbury (of the Blond voice) will have aphonia If he "pipes," we may be forced to use emergency measures

The Hon J B Wilson Jr, ex-District Attorney of this County, will talk to us after the meal "Jack" Wilson is so well-known for his ability in this and legal lines, that anything I might say would be supererogation

The scientific session will start at two p m and we are to have the rare good fortune to hear James Vander Veer, M.D., Genito-Urinary Professor at Albany Medical College, talk about Prostates

All the old men will be there, and the young ones ought to—"A stitch in time," you know

"Jimmie" Vander Veer knows his groceries, and he knows how to tell what he knows. Those of us who have heard him before will be there if we have to borrow crutches. Those who haven't heard him are educationally undernourished.

A direct antithesis to Professor Vander Veer's address will be the President's address I feel sick now when I think of it—you may tooperhaps I shouldn't have mentioned it

Shelley (not the poet) always insists on featur-

ing something unpleasant in these letters. This time he says that the New York State Department of Education has notified him that only 60% of the Orange County men have registered this year. This means that 40% of the doctors in this County will commit medical suicide and have to look for employment if they don't send in their \$2.00 re-registration fee before the end of the year. It looks like a cataclysmic moment for those who fail to register—catastrophic also

Now for a little boasting At the last annual meeting there were 92 paid-up members in this Society. We will close this year with 103 paid-up members, unless some are mean enough to die

just to embarrass me

Once more let me remind you that if you bring in a new member at this meeting, you and the new member will be my guests at the dinner. If you bring two new members you are expected to eat two dinners

I am assuming that every member who does not turn out to this meeting is either bed-ridden or a chronic grouch so you better come out to save your reputation

OSCAR NORTHWAY-MEYER,

President

NASSAU COUNTY

Nassau County has joined the ranks of six other counties which are issuing their own county society publications. The new publication, which began in December, 1927, is called the Nassau Mcdical News, and its pages are about the size of this Journal. Its leading article is on "Progress—And an Ideal," and says

"This meeting notice marks another mile-stone in the march of the Medical Society of the County of Nassau towards a position of dominance in the medical affairs of the County A position of-dominance, not of domination, a position of respect and influence, merited and earned by

service to the community

"Who but a physician is better qualified to lead in matters affecting the health and welfare of a community? Who but a physician is charged with greater responsibility in matters of public health? Where is there an organization better qualified or more logically entitled to assume leadership in these matters than an organization which includes nearly 100% of the leaders in the Medical Profession of the County, or one from whom the people may more justly demand that leadership?

"As the first step in our attempt at a fuller realization of these ideals and recognition of our responsibilities, we shall inaugurate with the coming year a real mouthpiece for the Medical Society of the County of Nassau, a medium of publicity for all of our committees, and we hope

at the same time a mouthpiece for such other organizations concerned with public health as wish to avail themselves of our space.

"We hope to keep our readers informed of contagious diseases in the several communities of the county, to provide an opportunity for the State Health Department to discuss its problems as affecting our community, and in general to provide a medium for the dissemination of news and information on all matters affecting the health of the community"

The News also has announcements regarding Graduate Education and says concerning its program for January

'In line with the policy of your committee to arrange for clinics in groups or courses, the month of January will be devoted to a study of Tuberculosis. The clinics will be held at the Nassau County Tuberculosis Sanatorium at Farmingdale and will be in charge of Dr. A. J. Davis of that institution. The subject will be covered in a comprehensive manner and will be supplemented by material available at the Sanatorium. This is a rare opportunity to secure a broad bird's-eye view of this important subject. Additional details will be supplied on the customary post-card."

With the establishment of Nassau Medical News, every county of the Second District Branch is now issuing its own monthly publication

CLINTON COUNTY

The Clinton County Medical Society was sponsor for a course of six lectures provided by the State Committee on Public Health and Medical Education and given by Dr Harris A Houghton, on Monday afternoons beginning October 24th in the hotel of Plattsburg The subject was cardionephritis, and the lectures and descriptions were repetitions of those given in the course in Montgomery County in 1926, and published in this Journal for August 15, 1926

The attendance at Plattsburg was 50% greater than that at the average meetings of the Clinton County Medical Society, and at the close of the course those attending it passed a unanimous vote of thanks to the officers of the County Medical Society and of the State Society, and to Dr The meeting also voted to request Houghton that plans be made for further post-graduate courses annually

The resolution further states "Courses of this nature provide instruction that cannot be obtained well from books, and when given in this manner provide a means of post-graduate education for the rural practitioner who cannot always take the time necessary to attend more formal courses in the larger centers of medical education"

MONTGOMERY COUNTY

The annual meeting of the Medical Society of the County of Montgomery, held December 14 in the Barnes Hotel, Amsterdam, was a testimonial dinner to one of its members, Dr Charles Stover, who has practiced medicine in Amsterdam, Montgomery County, ever since his graduation from the University of Pennsylvania forty-

seven years ago

The principal speaker was Dr Horace M Hicks, who has been a neighbor of Dr Stover in the practice of medicine in Amsterdam for over forty years Dr Hicks reviewed the outstanding items of medical progress since 1880 and showed how Dr Stover had ever been active in not only acquiring new knowledge himself, but also transmitting it to his medical brethren and to the people Dr Stover had always been public spirited, and was endowed with an unusual sense of his civic duties, which led him to be active in medical societies and in other civic organizations. Among the positions which Dr Stover had filled was the presidency of the Medical Society of the State of New York, the Chairmanship of the Amsterdam Chamber of Commerce, Membership on the executive council of the State Charities Aid Association, and of the board of directors of the National Tuberculosis Association Whenever a project for improving the practice of medicine comes up, or securing the support of the people for a public health project, the name of Dr Charles Stover rises in one's mind This dinner

was the spontaneous tribute of the members of the medical profession of Montgomery County to one of their number who was the friendly leader of them all

Dr Hicks then called on each of the forty members present to say a few words regarding Dr Stover and the responses were both serious and entertaining

Dr Stover responded by recounting the outstanding medical accomplishments which he had friendliness among the seen in Amsterdam doctors, sewage disposal plants and water works, a lowered rate of deaths and sickness, and a growing support of public health work by both the doctors and the citizens

The Society elected the following officers for

President, David Wilson, M D, Amsterdam Vice-President, Charles E Slater, MD, Fort

Secretary, William R Pierce, M.D., Amster-

Censors Charles Stover, M.D., E. C. La Port, MD, E Harrison Ormsby, MD, Amsterdam Treasurer Seymour L Homrighouse, Am-

sterdam Delegate, State Society H M Hicks, MD,

Amsterdam

Alternate Delegate C F Timmerman, M D Amsterdam

ORANGE COUNTY

Presidents and Secretaries of County Medical Societies who are looking for something original and striking will find it in the following official announcement of the meeting of the Medical Society of the County of Orange -- Editor's note

The annual meeting of the Orange County Medical Society will be held in the Mitchell Inn, Middletown, N Y, Tuesday, December 13, 1927

The dinner will be at 12 o'clock sharp, and

Pete Mitchell says he is going to feed you so well on Turkey et al, that an appetite will be ashamed to show itself much before Christmas Tax \$1 50 per

There will be TRIMMINGS with this meal Those of you who attended the Spring meeting

We will have singing also If you can't sing, you will have to listen and you have my sym-

THE DAILY PRESS

THE CANCER CAMPAIGN

A two-weeks' intensive campaign of popular education regarding cancer was inaugurated in the New York Academy of Medicine, November 22, at a meeting of prominent medical men. The important measure that was undertaken was the preparation of brief articles on cancer to be published in the New York City daily newspapers. How nobly the newspapers responded is shown by the following letter from Dr. J. C. A. Gerster, the Chairman of the New York City Cancer Committee, published in the New York Herald Tribune of December 14

"The work of the Herald Tribune and of other New York newspapers in the cancer campaign now drawing to a close is almost without precedent in the history of public health education, and its significance should be called to the attention of your readers

"The newspapers have long been recognized as among our greatest educational institutions Health education is a comparatively recent journalistic venture. It has come to stay. The public probably seeks medical advice from the news-

papers as eagerly as from the medical fraternity itself. The cooperation established between two such forces as the press and the American Society for the Control of Cancer is a milestone worth noting—an amazing contribution to the cause of public education. In seventeen New York City newspapers on twenty consecutive days 205 individual stories about cancer appeared, covering 2,118 inches of space, or one hundred newspaper columns. Moreover, following your lead, 114 newspapers throughout the country also carried the message

"From authentic sources I learn that there are now in our New York hospitals patients who applied directly because of what they read, were found to have early cancers and now possess the best chances of escape.

"In the name of these fortunates and in the name of the New York City Committee of the American Society for the Control of Cancer, accept our gratitude and thanks for your great contribution towards the relief of suffering humanity"

THE SMOKY CITY

Smoky air is one of the evils of the concentration of people and industries in a small area Hygienists have found difficulty in discovering harmful elements in smoke since the pigmentation of the lungs does not seem to be harmful, and soiled collars are harmless to health. But in recent years smoke has been indicted for two serious crimes against health, first, that of filtering out the ultraviolet rays of sunlight, and second, that of causing cancer. These two indictments are ample justification for the Department of Health of New York City to diagnose and treat the smoke condition.

The newspapers of New York have given full publicity to the smoke question, and have quoted the results of tests regarding the life-giving ultraviolet rays, and the millions of deadly particles of soot in every breath of inspired air. They have printed statistics on the percentage of carbon monoxide in the air, and the tons of unburned coal that float about the city. They have almost uniformly supported the Department of Health in its anti-smoke campaign and have printed some striking arguments. The New York

Sun of November 30, commenting editorially on "Lost Daylight," says

"No New Yorker needs expert opinion to assure him that the smoke nuisance in this city is deplorable, but our easygoing, leave-it-to-some-body-else patience has its limit and that has about been reached. When the United States Public Health Service gets down to facts and figures, as it has done in a recent report, and discloses in a way popularly comprehensible the extent of the city's loss from this cause it supplies to the average citizen reason for indignation which ought to give official complacency something to worry about

"If some sinister influence took away 42 per cent, of almost any other kind of property which belongs to the average New Yorker there would be a row about it which could be heard all over the world. Why, then, should the citizens tolerate unlawful deprivation of precious, health-giving daylight? Vigorous popular support of efforts to end the nuisance will bring it to an end, and that support will spur the officials of the town to the effort essential to clear the skies?

MEDICAL WARES

ASPIRATORS AND COMPRESSORS

Nature has adapted both aspiration and compression to the physiological functions of the human body Respiration is an alternation of aspiration and compression. Sneezing and coughing are adaptations of air compression for the removal of substances from the nose, throat and lungs. Swallowing is an act of efficient aspiration which affects the nose, haso-pharynx, and the ears.

Nature has developed an elaborate mechanism for the application of aspiration and compression, involving both the muscular and the nervous systems. The mechanism has preventive and therapeutic purposes as well as those which are physiological, and its efficient operation protects the air passages from injuries and infections to which their position and constant use especially exposes them.

Skilled physicians study the processes of nature and adapt them to the needs of the body with accuracy and precision. Sneezing and coughing and blowing the nose are comparatively crude acts which often lack efficiency and precision. The physician has developed instruments and machines for applying aspiration and compression in measured quantities, and directly to the pathological areas. These pieces of apparatus have their greatest use in the treatment of the nose and throat, and the ears, for these are the parts of the body in which the physician follows the indications and methods of nature.

The development of apparatus involving the use of compressed air has followed that of the evolution of most other therapeutic agents. First came the apparatus for applying curative substances to the nose and throat. The hand atomizer met this need in a crude way, but it was inefficient, and inexact, and was likely to produce infections. Moreover, it was only a compressor, and its field of usefulness was small, especially to the physician.

The universal availability of electricity has made possible the use of aspirators and compressors that are driven by small motors. The unit of these machines is the cylinder and piston, which supply either suction or compression. The cylinders may be arranged singly, or in pairs, or in batteries, they may be arranged for either suction or compression, they may be fitted with meters and manometers in order that their action may be gauged with accuracy. Bottles may be attached for collection of blood, mucus or secretion, or for spraying and anæsthetizing.

The earliest designers of apparatus made use of vacuum and compression storage tanks. These

became contaminated, and could not be cleansed readily. The air in them became damp, and bacteria growing in them produced unpleasant odors. The tanks were necessary when the power was applied by means of hand pumps, and in those days the physician was likely to use a prepared tank until it was exhausted, whether it lasted a day or a month. The use of electric motors has removed the occasion for the use of storage tanks, except possibly in emergencies at the bedside of patients remote from electricity.

Storage tanks have their use in physicians' buildings in which outlets for both compression and vacuums are available in every treatment room. Their advantage is their ready availability. They have the objectionable feature that the physician does not know the source of the air or its cleanliness.

The steadiness of the compression or vacuum delivered directly from the cylinders of a machine is ensured by the high speed of the pistons, and by a multiplicity of the cylinders. Modern machines also make provision by which a collecting jar may be attached and detached by the turn of the hand. The careful physician will prefer to use an apparatus in which every operation from the entrance of the air to its application to the patient is under his direct observation and control. The complete units which are located in the doctor's office have all the advantages of the central air supply system, with the added feature of known purity of the air.

The development of suction and compression in an office unit has a peculiar field in the treatment of ear conditions in which a vibratory effect is desired, as in the loosening of adhesions of the ossicles. A cylinder running at slow speed produces a series of impulses which may be applied to the ear drum or the eustachian tube, either in compression or suction.

An apparatus for the application of suction and compression is almost necessary for the general practitioner in these days A rhinitis with occlusion of the sinuses is one of the most common conditions for which patients seek relief, and the physician cannot give it without the proper ap-On the other hand, every physician is paratus now expected to have the ability to use an apparatus with skill in common conditions facturers of apparatus for suction and compression offer their products in every possible torm, from the small unit which may be carried to the obedside of a patient, to an elaborate outfit combining all the features which a specialist will use in this varied practice. -

BOOK REVIEWS

LIGHT TREATMENT IN SURCERY By Dr O BERNHARD Octavo of 317 pages, 105 illustrations London, Edward Arnold & Co, New York, Longmans, Green & Co, 1926 Cloth, \$750

The translation of this treatise by Bernhard has been most fortunate because one may feel that the statements contained therein are authoritative. Bernhard, a pioneer of heliotherapy, resides in the Alps His conclusions are based upon experience gained at a sanatorium at St Moritz

The treatise contains more than a discussion of light therapy. One hundred and fifty pages of introduction are devoted to the general discussion of biological an appear of light therapy. Then follows a description of this therapy applied in surgery, especially the surgery of tuberculous lesions.

In summary, one feels that the entire work is convincing because it is based upon the personal experience of the writer ROBERT F BARBER.

Muscular Contraction and the Reflex Control of Movement By J F Fulton, B Sc. Octavo of 644 pages, illustrated Baltimore, The Williams and Wilkins Company, 1926 Cloth, \$1000

This book deals with the mode of contraction and reflex control of skeletal muscle. Full description is given to the recent physiological advances made in muscular and neuromuscular activities. An exhaustive account is given of the phenomenon of the contraction of the individual muscle fibre. This is finally linked with the mechanisms of muscle tonus and general body posture. It is an exhaustive study covering every phase of the subject, and built on a rich personal experimental experience. The work is a highly scientific contribution to a most common phenomenon with which but few are acquainted. Despite the highly technical nature of the subject matter, the book is written in an interesting style. A bibliography of over one thousand references adds to the value of the book

IRVING J SANDS

HOSPITAL HOUSEKEEPING AND SANITATION By Nora P HURST, R.N 16mo of 155 pages St. Louis, The C V Mosby Company, 1926 Cloth, \$1 25

Miss Hurst has collected a large amount of information on Hospital Housekeeping and Sanitation and presents it in the form of a Manual containing 10 brief chapters

This book is intended for the instruction of probationers and pupil nurses and will be useful to instructors in Training Schools

It presents to the beginner in a concise and accurate way the fundamental principles and contains may prac-

tical and useful suggestions

At the end of each chapter a practical lesson is given for the class in which the pupils are called upon to perform the duties as described in the chapter

The index at the end of the Book has been carefully prepared and helps to make it a handy reference work Adam Eberle.

ELEMENTS OF HYGIENE AND PUBLIC HEALTH An Introduction to Preventive Medicine for Students and Practitioners of Medicine. By CHARLES PORTER, MD Second Edition 12mo of 425 pages, with 98 illustrations London and New York, Oxford University Press, [1926] Cloth, \$450 (Oxford Medical Publications)

As the subtitle states this handy volume of 393 pages with a very complete index of 32 pages is of particular value to medical students and physicians. The medical

profession today is realizing more and more its civic and personal obligations in the field of health conservation and those who desire a small reference work will find Dr Porter's book a real acquisition. It is comprehensive yet not so detailed as to appeal only to the expert For the physicians in this country the chapter on Sanitary, Law is of little value as that is written from the British viewpoint.

THE SPECIALTIES IN GENERAL PRACTICE. Compiled by Francis W Palfrey, M.D. Octavo of 748 pages Philadelphia and London, W. B. Saunders Company, 1927. Cloth, \$6.50

Any encouragement to the general practitioner in the acquisition of accepted knowledge is on the whole commendable, and while it is truly said that the subject of medicine is now so broad that no one mind can grasp it all, still the knowledge and appreciation of that knowledge necessary to the sane and economic care of the sick and injured may very properly be sought by many doctors of medicine who do not quite like to feel that they are only first-aid men, but are gratified in feeling that by reason of intelligent care from the first they are often privileged to conduct the patient through serious troubles sometimes with the counsel of experts and sometimes without Dr Palfrey and his group have furnished the doctor with an excellent work sympathetically presented, which we commend The compiler is certainly a doctor in a broad sense.

W S H.

Intracranial Tumors and Some Errors in Their Diagnosis By Sir James Purves-Stewart Octavo of 206 pages, illustrated. New York and London, Oxford University Press, 1927 Cloth, \$3.75 (Oxford Medical Publications)

This book, which discusses the histories of 117 intracranial new growths anatomically verified by surgical operation or autopsy, is constructed along the lines of thoroughness characteristic of the well trained Englishman

The subject proper is preceded by a reminder of the signs common to intracranial tumors in general

These lessons are surveyed according to the various regions of the brain involved, and not the least valuable section is that including the chapters on "Gross Errors in the Diagnosis of Cerebral Tumors," "Some Pitfalls in Diagnosis," and "Errors—Avoidable and Unavoidable."

There is a distinctive personal note of this monograph in the absence of quotations from other observers. The author's design in so doing was to stimulate a more definite reaction to supplement deficiencies of these histories by the students' independent observations. It is a practical contribution of value to the literature in this field.

H G Dunham

NORMAL MIDWIFERY FOR MIDWIVES AND NURSES BY G W THEOBALD, B.A., M D Octavo of 258 pages, illustrated. London and New York, Oxford University Press, 1927 Cloth, \$3 15 (Oxford Medical Publications)

Told in the simplest kind of language in a very engaging way, this little book might well be read by every midwife in this country. The overtrained nurse—we have many of them—will find here the answer to the many simple problems of normal obstetrics which so often confront her. The author would have midwives make no vaginal examinations, and teaches the practical value and ease of rectals. To those lecturing to nurses this book is highly recommended. It is never heavy, always simple and astonishingly well done.

C. A G

LICENSING DETECTIVES

The subject of licensing detectives was considered at a meeting of the Sub-committee of the Baumes Crime Committee, on December 15, in the rooms of the Bar Association, New York City Dr George F Chandler, of Kingston, is chairman of the Sub-committee He was formerly head of the State Police, and is therefore familiar with the system of crime investigation

The work of a detective is necessary and honorable. Much of it is done in secret, and with the cooperation of local police who have no means of identifying the men who claim to be detectives. At present any person may go to the police headquarters of a village or city and ask the assistance of the local authorities in discovering a criminal or getting evidence of alleged crime. The system lends itself to grave abuses which

the Sub-committee is seeking to prevent by requiring the State registration of detectives

The New York Tribune of December 16. de-

scribing the Conference, says

"The Committee is preparing resolutions to be presented to the full crime commission at its meeting in the Bar Association early in January Should these resolutions be adopted, bills covering their text will be introduced into the Legislature for enactment into law

"If judges and lawyers must pass examinations there is no reason why detectives should not do likewise. It must be recalled they are frequently called to the witness stand in most important cases, and they should have at least a smattering of law. There are also qualifications as to per-

sonal character"

THE CHEMISTRY OF MORALS

The doctrines of foreordination and freewill enter into scientific discussions of conduct or morals. It is well known that the endocrine glands—the adrenalin, the thyroid, the pituitary and others—have an influence on mental emotions and may even dominate mental actions. The unbalanced action of these glands, either of excess or lack, is evidence of the dominance of foreordination, in some persons at least

But the principle of freewill and of control of conduct is dominant in the normal human being, and it is in the normal person that the glands function the most perfectly. While it sometimes happens that unsocial acts are accompanied by endocrine unbalance, yet the restoration of the balance seldom cures the abnormal mental state. Both freedom of choice and predestination seem

to be mental actions originating in the brain, rather than physical phenomena produced by the endocrine secretions

The influence of endocrines on morals is discussed in an editorial in the New York Herald-Tribune, which concludes with the following remarks to which physicians will subscribe

"It is a complete misreading of the gland theories to imagine that they relegate responsibility for individual actions to some impersonal universal chemistry which has happened to mix the ingredients wrongly. Even in the most cold-blooded of scientific theories there is still room—and necessity—for the doctrine that how a man acts is pretty much his own merit or his own fault. This is both the moral of chemistry and the chemistry of morals."

IMMUNIZATION AND EDUCATION

The New York Times of November 28 discusses campaigns for the prevention of diphtheria and smallpox with reference to two methods of education and group immunization. It says

"Not long ago reports were published of a group of towns which had wiped out diphtheria and smallpox by an intensive campaign lasting a few weeks of each year for three or four years. In some places the diseases were absolutely eradicated, in others two or three cases were found last year, due to the presence of new families. The education of the public there will probably make further campaigns of equal vigor unnecessary, for the general feeling of the importance of immunization of infants and newcomers will have the desired effect.

"Such swift results as have been attained should be pointed out to the two communities where these scourges are reappearing" The editorial then mentions the increase of diphtheria in New Jersey and smallpox in England, and concludes

"Education is better than rigid rules for immunization. It is the plan successfully followed by some of our New York towns. Yonkers, Middletown, Syracuse, Rochester, Schenectady and Newburgh have splendid records for quick work with a permanent value. The pamphlets they published telling how they did it might be profitably studied by communities now suffering from a sudden increase in diphtheria or smallpox."

The daily newspapers have been loyal supporters of the anti-diphtheria campaign conducted by the physicians of New York State. They have carried on the educational side of the campaign while physicians have attended to the immunizations.

PRACTICAL LECTURES ON THE SPECIALTIES OF MEDICINE AND SURGERY Delivered under the Auspices of the Medical Society of the County of Kings, Brooklyn, New York (Second Series, 1924-1926) Octavo of 590 pages, illustrated, with 110 illustrations New York, Paul B Hoeber, Inc., 1927 Cloth, \$700

The second volume of the Practical Lectures for the Medical Society of the County of Kings carries on the publication of the lectures which have achieved so much success in Brooklyn Intensely practical, to the point, without a line of filler the entire field of general practice is well covered. Great names are to be found in the list of contributors-teachers talking, not writing, on the common problems of daily practice. The book is an excellent refresher for the average man, a post-graduate course in itself, as well as easy reading for the specialist who so often finds little time to read outside his own field. A valuable book which should find favor every-

Surgical Clinics of North America. Volume 6 No 4 August, 1926 (Chicago Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.

With a few except ons, most of the contributors to this number are men whose names are probably little known outside their own community Still, the quality of the Clinic is of the usual high order, and the reader will find many instructive case-reports, and excellent discussions of topics of great importance.

SURGICAL CLINICS OF NORTH AMERICA. Volume 6 No. 5 October, 1926 (Mayo Clinic Number) Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$12.00 net.

The almost limitless amount of the clinical material of the Mayo Clinic naturally affords the opportunity of presenting an unusual variety of all kinds of interesting conditions The value of this issue is further enhanced by the statistical report of a large series of operative work on the biliary passages
In addition to the clinical work, we get a glimpse of

the extensive research studies carried on under the aus-

pices of the Clinic.

Surgical Clinics of North America. Volume 6 No 6 December, 1926 (New Jersey Number) Index Number Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200

One is quite favorably impressed with the New Jersey imber The bulk of the work comes from the various Newark hospitals, but a considerable proportion of the contributions emanates from other communities, as Cam-

den, Atlantic City, Jersey City, etc.
The case-reports are well selected, the discussions quite illuminating, while the illustrations indicate a high degree of surgical craftsmanship HERMAN SHANN

HERNIA AND HERNIOPLAST! By ERNEST M. COWELL, DSO, MD With an introduction by Sir Arthur Keith, FR.C.S Octavo of 128 pages, illustrated. New York, Paul B Hoeber, Inc., 1927 Cloth, \$3 50

This interesting little book should be read by every surgeon doing or attempting to do operations upon inguinal hernia. It is essentially an apology for the author's operation as are so many monographs on this and other surgical subjects but it consists, in the main, of a sketch of the operative treatment of inguinal hernia. This is broadly and thinly considered and most pages will suggest further consideration

The author introduces a method of fascial transplant combined with fascial suture which he offers as a surgi-cal panacea. "In the author's series two hundred flap operations have been performed without recurrence. The

patients have been carefully followed up (90%) The cases were in no way selected, no herma was refused hermoplasty and the flap operation was also done as a J E. J cure after strangulated hernia.

THE AMERICAN ILLUSTRATED MEDICAL DICTIONARY New and Complete Dictionary of the Terms Used in Medicine, Surgery, Dentistry, Pharmacy, Chemistry, Nursing, Veterinary Science, Biology, Medical Biography, etc., with the pronunciation, derivation and definition By W. A. Newman Dorland, A. M.D. 14th Edition, revised and enlarged Octavo of 1388 pages, illustrated. Philadelphia and London W. B. Saunders Company, 1927 Flexible binding Plain, \$7.00 net. Thumb Lades, \$7.50 net. net, Thumb Index, \$7 50 net.

Although only two years have clapsed since the publication of the previous edition, the increasing volume of medical literature has made a new edition of this stan-dard dictionary desirable. The reviewer has put this volume to the test of many new words and in every instance found the definitions clear, exact and sufficiently comprehensive. We can heartily recommend Dorland's dictionary as a reliable reference work and thoroughly approve of the principle of publishing new editions at short intervals FREDERIC DAMRAU

Tuberculosis of the Lungs A Practical Guide for General Practitioners By H Hyslop Thompson, MD, and A. P Ford, MR.C.S Octavo of 179 pages, illustrated New York, William Wood and Company, 1977 Clash 6400. Cloth, \$4 00

This book is written as a practical guide for general practitioners It covers the whole subject of pulmonary tuberculosis in the usual routine manner. A careful perusal fails to reveal any particular new viewpoint

The impression on concluding a reading thereof is that it is just one more book on the subject, neither particularly good nor particularly bad

Approaching Motherhood Questions and Answers of Maternity B₃ George L. Brodhead, M D 3rd Edition. 12mo of 193 pages New York, Paul B Hoeber, Inc., 1927 Cloth, \$1 50

The third edition of this little book of Questions and Answers covers the field of approaching motherhood in a very simple and concise manner. It gives instruction to the prospective mother in a subject of vital interest to her and teaches her to be able to help herself

Dr Brodhead has used great judgment in selecting his questions and answers, so that they cover very completely the information which a mother should have, and they expose the fallacy of many of the popular ideas. The book is clearly and simply written, and it should

be of great practical value to the expectant mother WM SIDNEY SMITH

TEXT-BOOK OF BACTERIOLOGY By WILLIAM W FORD, M D Octavo of 1069 pages, with 186 illustrations Philadelphia and London, W B Saunders Company, 1927 Cloth, \$8 50

This text-book of bacteriology by Prof Ford is a high-grade work and should be widely used. While treating of systematic bacteriology in much the usual way, it has certain original features and presents other matter more fully than the usual one-volume work. The author describes an unusually large number of organisms found in medicine, comparative pathology and in hygiene and public health work. The chapters on staining and culture methods present many procedures not available in other works. He describes at length the anaerobes, aerobic spore-bearers, spirochetes and filtrable viruses, organisms which are being intensively studied at present and which physicians and public health workers are finding increasingly important. Throughout the text he uses the classification of the Society of American Bacteriologists The illustrations are numerous and ex-cellent and the bibliography is full and conveniently placed in the text. One can recommend this book with E. B SMITH pleasure.

TIGER TRAILS IN SOUTHERN ASIA BY RICHARD L. SUTTON, M D Octavo of 207 pages, with 115 illustrations St Louis, The C V Mosby Company, 1926 Cloth, \$2.25

This is a description of Dr Sutton's experiences and observations on a hunting trip to Indo-China and India It is written in a pleasant style by an experienced writer on a variety of subjects other than medical, and he adds to the interest of his narrative very much by his notes on the habits and characteristics of the tribes and peo-

ples of those countries

The text is illumined by about one hundred reproductions of interesting photographs, taken during the expedi-His description of the fauna and their habits. characteristics, and methods of hunting them is of much Some good advice is given to those who prointerest pose to take a hand in the rather rapid extinction of the big game of those far off parts of the globe. Based on his experience and observations he gives advice as to guns, equipment and stores which will be needed

The book is well worth reading not only as a book of travel but for its notes on anthropology and wild life of the region visited. E H BARTLEY

the region visited.

THE PRACTICAL MEDICINE SERIES Comprising Eight Volumes on the Year's Progress in Medicine and Sur-Comprising Eight gery Under the General Editorial Charge of Charles L. Mix, A.M., M.D. Series 1926. Chicago, The Year Book Publishers, 1926 General Therapeutics Edited by Bernard Fantus, M.S., M.D. 12mo of 399 pages, illustrated Cloth, \$2.25 Price of the series of eight volumes, \$1500

This volume is written on the same plan as its predecessors of this well known series, consisting of abstracts from the principal medical journals The first chapter is devoted to an evaluation of the newer drugs of the beliefs expressed here are that benzyl benzoate does not possess true therapeutic ment, that novasurol (merbaphen) renders its greatest service in those cases of edema not renal in cause, but due to circulatory disturbance or hepatic cirrhosis, and that no good case has heen made for the employment of insulin in non-diabetic conditions such as the treatment of marantic infants or in the pernicious vomiting of pregnancy Various therapeutic measures are discussed and some of the newer physical measures are described.

There is considerable space devoted to a discussion of oxygen therapy in pneumonia and this is worth while. for this procedure has probably never received the at-

tention it deserves

Surgical Anatomy of the Human Body By John B Deaver, M.D. 2nd Edition. In 3 volumes, thoroughly revised and rearranged

Volume II Upper Extremities, Neck, Shoulders, Back, Lower Extremities Quarto of 854 pages, illustrated Philadelphia, P Blakiston's Son and Company, 1926

Volume III Joints of the Lower Extremities, Chest, Thorax, Abdomen, Pelvis, Perineum. Quarto of 763 pages, illustrated Philadelphia, P Blakiston's Son and Company, 1927 Cloth, sold by subscription to the 3 volumes, at \$36 00

It was our pleasure, a few months ago, to review and welcome the first volume of the new edition of "Surgical Anatomy" by Dr John B Deaver Volumes II and III

are now with us

To meet the advances of modern surgery and to rearrange the contents into a more systematic scheme, was the aim of the author in his new edition. The satisfaction with which we noticed the new arrangement of subject matter in the first volume, is not lessened with the reading of the second and third volumes

Volume II contains both extremities, the neck, shoul-In the older edition, this matter was three volumes Volume III contains ders and back scattered through three volumes joints of the lower extremities, thorax, abdomen and

permeum.

The student, and teacher as well, will derive benefit from the changes in the new edition. Not only will the material under consideration be easier to find, but the student will feel that he has the last word of a master Surgeon on the surgical aspects of the various anatomi cal regions

We desire to state again, without any fear of tirms the reader by repetition, that this is a most substantial contribution to our work-shop. These volumes should always be at the elbow of the active surgeon. They seem to just cull what he needs in the anatomical prob

lems that confront him daily

The author has attained his aim in the new edition. The modern advances in surgery have been ably met and the new arrangement of material is highly satisfactory, and a great improvement. May the completed work receive the acclaim and support of the profession. It is the just due of a worthy labor

ROBERT F BARBER.

HEART AND ATHLETICS Clinical Researches Upon the Influence of Athletics Upon the Heart. By Felix Deutsch, MD, and EMIL KAUF, MD English translation by Louis M Warfield, AB, MD 12mo of 187 pages St. Louis, The C V Mosby Company, 1927 Cloth, \$250

This book is based upon work done at the "Heart Sta tion" in Vienna which has for many years been the cen tral place for the heart examinations of athletes participating in all kinds of sports. The size of the heart was determined by orthodiagrams and less often by teleroent genograms. The influence upon the heart of the various forms of exercise is discussed in separate chapters

As a result of their observations the authors believe that athletics brings about changes in the heart in a con siderable number of cases Among the various types of exercise which place the greatest strain upon the circula tion are rowing, bicycling and skiing, standing at the top, while boxing, football (soccer) and fencing rarely give rise to cardiac enlargement. In a middle position are swimming, hiking and most of the other sports believe that subjective symptoms do not help as much in the expression of an opinion concerning the heart as they are often lacking in cases of demonstrable cardiac en largement. It is often the case that complaints of nervous persons who have quite normal hearts are the same as those who have organic heart disease.

The book should prove of considerable value, especially to those physicians in colleges and elsewhere who are advisors in athletic matters

LIVER FOODS IN PERNICIOUS ANEMIA

The November issue of the *Illinois Medical Journal* contains the following article on the preparation of dishes of liver for those taking the liver treatment for pernicious anemia

While liver seems to be presenting increasing evidence of its value in the treatment of anemia, physicians everywhere are finding it difficult to keep patients contented and happy while they are taking it. One patient who was told that she must continue indefinitely to consume about a pound of liver daily, said. "Doctor, it can't be done. I can't even take liver every day, and certainly not for every meal." This state of affairs is due partly to the fact that few people can cook liver in any other way than by frying, and the following recipes are presented in the hope of alleviating this truly monotonous and not very appetizing dietary.

The recipes are taken from English and French sources, as in these countries liver is a much more popular article of food than it is in the United States

FRENCH WAYS OF COOKING LIVER

1 pound of liver

1 slice of bread grated—this means grated, not crumbled

1 tablespoonful of chopped parsley

½ teaspoonful of salt ¼ teaspoonful of pepper

A very thin slice of ham

Wash the liver well and cut into thin slices, put into casserole, sprinkle the bread crumbs over it, then the parsley, pepper and salt. Cut the ham into strips and lay it on top, then pour in one teacupful of cold water. Bake in oven for half an hour

Another French recipe is as follows

1 pound of calf's liver

3 tablespoonfuls of grated bread crumbs

4 large mushrooms, chopped

1 medium-sized onion finely chopped 2 sprigs of parsley finely chopped

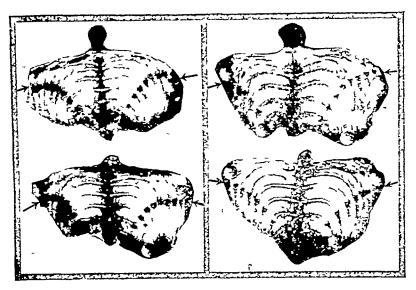

1/2 teaspoonful of salt and a pinch of pepper

Cut the liver into slices half an inch thick, and sprinkle each slice with the mixture of bread crumbs, mushrooms and seasonings, put in a casserole, pour over it one-half pint of cold water or good soup stock, and bake in a slow oven for three-quarters of an hour (Continued on page 50—adv xiv)

(Continued from page 48)

LIVER MOLDS

This is an English recipe

Take 1 pound of liver, boil it and grate it with three strips of bacon Mix it with about one-fourth of the amount of bread crumbs, the yolk of two eggs and seasoning to taste. Steam in buttered molds

LARDED LIVER

This recipe is taken from a Scottish cook-book

Take a lamb's liver and lard it in rather close rows, covering the whole upper surface. Place it in a deep casserole with chopped onions, carrots, slices of fat bacon, salt, pepper, and sweet herbs (sage, etc.) Cover with water or a good soup stock. Cook in a moderate oven for forty or fifty minutes. Turn out on a hot dish Thicken the liquor slightly with flour and butter, adding a small amount of lemon juice and paprika.

MINCED LIVER

This, also, is a British recipe.

Boil 2 pounds of liver till it is firm enough to chop easily, then mince it rather fine with a little bacon. Chop a Spanish onion and fry slowly in butter or bacon fat—just long enough to make it soft, then add the liver, season very slightly with salt and pepper and cook slowly, stirring continually for ten or twelve min utes Then add a cup of soup stock and a tablespoonful of chopped parsley and a very little Yorkshire relish (this last item may be omitted) Cover closely and let simmer gently for about an hour Serve on toast.

CALF'S LIVER WITH FINE HERBS

This is a French recipe taken from an old English cook book

calf's liver

bunch of savory herbs, including parsley

2 chopped shallots (onions may be used instead, but they should be parboiled before chopping)

1 teaspoonful of flour

1 tablespoonful of vinegar 1 tablespoonful of lemon juice

1/4 pint of water Pepper and salt to taste

Cut the liver into slices, dip in flour, and fry in butter till a light gold color Take out of pan and keep

Mince the herbs very fine, put in frying pan, add a little more butter, add the remaining ingredients, simmer gently until the herbs are cooked, and then pour over liver

CALF'S LIVER LARDED AND ROASTED

Take one calf's liver and lard it. Put it into vinegar with an onion cut in slices, parsley, thyme, bay leaf and a little salt and pepper Let it remain in this pickle for twenty-four hours, then roast and baste it frequently with the vinegar Serve it with brown gravy or a sauce made with chopped herbs The time required for roasting is rather more than an hour

MOCK DUCK

This is a Canadian recipe

Take a fresh calf's liver and stuff with duck dressing (sage and onions, which should be parbolled before being mixed with the other ingredients). Put the stuffed liver in a pan, cover with strips of bacon and bake for two hours, basting frequently with the fat J.A.M.Afrom the bacon strips

Liver cocktail Liver in edible form for pernicious

anemia patient.

An edible liver cocktail is prepared by William Thomes Wilkins, Jr., Piqua, Ohio (Journal A M A, Sept. 17, 1927), as follows After having scraped the liver it is run through a meat grinder twice, the finest cutter being used, and placed on ice immediately One-half pound of liver makes four tablespoonfuls of crushed product. Prepare a sauce as follows Tomato catsup (Heinz), ½ cup, lemon juice, ¾ cup, Worcestershire sauce, 2 teaspoonfuls, chives (finely chopped), ½ teaspoonful, and salt and pepper, to taste. Mix the liver and sauce in the proportion of one part crushed liver and two and a half parts of sauce. Chill thoroughly and serve in a cocktail glass with salt crackers or wafers

KETOGENIC DIET FOR EPILEPSY

The leading article of the Rhode Island Medical Journal for November is on the treatment of epilepsy by the ketogenic diet by Dr F R Talbot, of Boston, and from it the following extracts are taken

"The ketogenic diet results in complete symptomatic relief of the epileptiform symptoms in at least 33 per cent of children, and it is followed by definite improvement in nearly three-quarters of the cases Results are equally good in petit mal and grand mal They are less satisfactory

in the adult than in the child

"Twenty-four children underwent various penods of fasts in the Children's Clinic of the Massachusetts General Hospital with relief of symptoms during the fast, but in all cases the administration of food was followed by a return of the attacks within a few days or weeks ketogenic diet was then instituted, and it was found that the same chemical changes took place in the body as did during fast. The most striking changes were a lowered blood sugar, a moderate ketosis-acidosis as shown by a large amount of acetone in the blood, breath; and urine, and a slightly lowered carbone-dioxide combining power of the blood It was thought that the clinical improvement was due to some of these chemical changes Although it is not clear which factor is responsible for this, it is possible that the anaesthetic action of acetone may be the cause of the improvement

"Carbohydrate is necessary for the complete oxidation of fat, and if sugar is not present in sufficient amounts, the metabolism of fat only progresses to the stage of ketones. The antiketogenic element is found principally in carbohydrate, and the ketogenic element is mainly in fat So long as the proportion of ketogenic food as compared to the antiketogenic food is less than 1½ 1 a ketosis will not develop, but when it is 2

or more to 1 a ketosis is to be expected

"It is difficult to say what should be included as cure. Some cases are free so long as they obstain from carbohydrate, but have attacks when-

ever they break the diet An example of this is a boy of the Massachusets General Hospital group who had been free from attacks for fifteen months. He then ate considerable amounts of candy, and the attacks returned. They were quickly relieved by returning to a strict diet Such cases apparently can be kept free from at tacks so long as they refrain from extra carbohydrate. Many cases have now been entirely free from attacks for several months.

"The proportions of ketogenic to the antiketogenic foods of the usual normal diet are about 1.4. The patient is first put on a 1½ 1 diet, which is a marked increase in fat and decrease in carbohydrate. The proportions are such, however, that the ketones, acetone, B-oxybutyric acid and diacetic acid should not appear in the unne

"This diet may be given for ten days to two weeks until the body adjusts itself to the unusual amount of fat and the diminished carbohydrate. The proportions are then changed to 21 The sodium nitroprusside test for the ketone bodies appears in the urine, but the burgundy red color of the ferric chloride test is negative until the proportions of the diet are increased to 21/2 1 This and subsequent changes to 3 1, 3½ 1 and 4 1 are made at one to two week intervals The tests of the urine give checks of how well the diet is being followed. In nearly all instances it is necessary to increase the diet to the proportions of 4 1 before the symptoms completely disappear This can usually be done in two months' time. The patient is kept on the diet until he is free from The diet is then symptoms for six months gradually relaxed by increasing the carbohydrate ten grams at a time and reducing the fat in corresponding amounts so that the total food intake contains the same number of calories changes are made until the child is on a normal diet with a limited amount of carbohydrate. Candy and other sweets must always be excluded from the final diet

"In the preparation of the diet certain needs must be supplied in order to keep the child healthy. The total amount of food given must be enough both to prevent loss of weight and allow for normal growth. The protein must also be supplied in amounts that will allow for repair and growth. In the majority of instances the requirements will be fulfilled if one gram of protein is given for every kilogram of the expected body weight (weight for the height).

"Twenty-four hour amounts of urine should be examined at intervals and the protein (nitrogen) excretion from the body quantitated A' negative balance takes place when more protein is excreted than is taken in the food. If this should happen over a long period the health would eventually suffer. In most instances, how-

(Continued on page 53-adv vvii)

(Continued from page 52-adv ven)

ever, the amount of protein recommended is sufficient to prevent this. All my cases except one have had protein retention

"Since milk, one of the main sources of calcium, is nearly eliminated from the diet, and since calcium excretion is increased during an acidodis, it is well to supplement the food calcium by calcium in some other form. Our routine is to give two or three teaspoons of calcium lactate daily with the meals. It is very soluble in water and may be so given, or it can be mixed with the food. Copious water drinking is desirable to ensure free elimination. A minimum of six to eight glasses of water should be drunk daily."

THE TRI-STATE CONFERENCE

Concerning the Tri-State Conference of the Officers of the Medical Societies of New York, New Jersey, and Pennsylvania, the *Journal* of the Medical Society of New Jersey says editorially

"Under 'Current Events' we are publishing in this issue of the Journal a complete report of proceedings of the most recent session of this 'Conference,' believing that the subject dealt with is of sufficient importance to justify the amount of space allotted Enlightened action upon any public question, especially one calling for the passage of additional laws, can only be had when those interested and the lawmakers have made themselves familiar with all its detail. It is surprising how many points of contact, how many farreaching ramifications, an apparently simple question may have A mere review of the need for 'state control of private hospitals' disclosed the fact that there are a number of sides to this question which had not been evident at first As further legislation upon this matthought ter will doubtless be asked for in these three states, our members would do well to study the question and express their views thereupon

"It is a pleasure to report, in this connection, that the plan of holding periodic conferences of the officers of medical societies in adjoining states, which originated in New Jersey, was the principle topic for discussion at the recent Annual Meeting of Secretaries of State Medical Societies, and that it met with general approval. The New England States have organized a similar body, and we anticipate the formation of other State groups, since it is perfectly natural that state societies whose members have the same interests and have normally to deal with exactly the same problems should confer as to uniform methods of procedure.

HOLIDAY GREETINGS

The green cover of the December issue of the Journal of the Michigan State Medical Society carries the following holiday greetings from the president, Dr H E Randall

"Ebenezer Scrooge, the hero of A Christmas Carol, by Dickens, was a tight-fisted hand at the grindstone—a squeezing, wrenching, grasping, scraping, covetous old sinner! Hard and sharp as flint from which no steel had ever struck out generous fire, secret and self-contained and soli tary as an oyster The cold within him froze his old features, nipped his pointed nose, shrivelled his cheek, stiffened his gait, made his eyes red, his thin lips blue, and spoke out shrewdly in his grating voice A frosty rime was on his head and on his eyebrows and his wiry chin He carried his own low temperature always about him, he iced his office in the dog days, and didn't thaw it one degree at Christmas

"Scrooge, after being visited by three ghosts the ghost of Christmas past, the ghost of Christ mas present, and the ghost of Christmas yet to come, and after seeing his own name on a neglected grave, he reforms and amply makes The lessons of his dream are not forgotten He sends a prize turkey to the Cratchits, twice the size of Tiny Tim, and gives a crown to the boy that goes and buys it for him He surprises his nephew and next day raises Bob Cratchit's salary He becomes, in short, as good a friend, as good a master, and as good a man as the good old city knew, or any other good old city, town or borough in this good old world

"If this good old world could have the Christmas spirit the year around, the millennium would Christmas is the time of gladness and good cheer, sunniness and gladness, friendliness and fellowship, the time of well-wishing and remembrances, and of peace and good will

towards all mankind

"Fortunate are the doctors of Michigan who live in its 'Thirty-seven Million Acres of Diamonds' Michigan, with its good roads, its inland lakes, its great lakes, with its maritime commerce, its great factories, of food, furniture, automobiles, and with such natural resources make Michigan, while not the most populous, the most prosperous state in the Union 'If you seek a beautiful peninsula, look about you'

"The State Society is in happy, working harmony with its great institutions of learning

"There is no more high-minded, loyal and devoted profession than the medical profession of Michigan, whose services are at the call of the rich and of the poor, throughout twenty-four hours of the day

"To the members of this noble profession ! have the pleasure to wish you, one and all, a Merry Christmas, a Happy New Year, and long life and health?

EDUCATION BY THE ILLINOIS STATE MEDICAL SOCIETY

The Educational Committee of the Illinois State Medical Society has a report in the December issue of the Illinois Medical Journal describing the work of the Committee for the three months ending November 30, 1927 The report says

"1,510 press articles were released to newspapers in Illinois These included the regular health column used by 52 papers over the signature of the local county medical society, articles on diseases prevalent in certain communities, and news items regarding the regular and special medical meetings held in the state

"50 press articles were written and censored by the Educational Committee

"350 physicians spoke before lay organizations representing all sections of Illinois These physicians brought the message of preventative medicine to universities, high schools, teachers' institutes, women's clubs, all types of men's service clubs, Parent-Teacher Associations, Y M C A's, Y W C A's, business and industrial groups

"Several organizations in the state have asked for a health program once each month. The public is becoming conscious of the fact that if they wish competent and authoritative speakers to talk on subjects pertaining to health, application should be made to the Educational Committee of the Illinois State Medical Society

"30 radio talks were given over stations WGN, WJJD and WLS Ten-minute talks were given every Tuesday morning at 11 45 over WGN

"29 moving picture films were ordered for hospitals, schools and churches, also to illustrate special talks given before men's and women's clubs

"Thousands of posters and educational pamphlets were secured for distribution at special meetings

"A Colored Speakers' Bureau has been organized which will enable the Committee to schedule speakers for the colored men's and women's clubs in Illinois

"The Committee assisted three communities with Toxin-Antitoxin educational campaigns

"The Committee co-operated with other agencies during National Education Week On Health Day talks were given by Chicago physicians before 8,000 Chicago High School students, and newspaper articles were released to one paper in each county of the state

"Physicians scheduled to speak before lay audiences may be able to secure outlines and reference material through the office of the Educational Committee"

PHOS-HEPATIC EXTRACT

A tonic stimulant and hematinic exhibiting beef liver extract in a palatable form

The value of a liver diet for anemia has been generally recognized. A daily diet of cooked liver fulfills the indications but is difficult to feed over long periods owing to appetite lag

Matthews' Phos-hepatic Extract by its simplicity gives the physician an excellent opportunity to add the elements of liver extract and glycerophosphates to his own prescriptions

[Small controlled doses-high vitamin content.

Indicated after surgical operations, and in convalescence from acute illness, the exanthemata in children, various forms of anemia, in neurasthenia and in general whenever a tonic, stimulant and hematopoietic agent is desired.

DOSAGE

For adults 1 tablespoonful taken plain or in a little water 3 times a day

For children: one to two teaspoonfuls diluted with water

Supplied in 12 oz. bottles

HOMES FOR COUNTY SOCIETIES

Pennsylvania is noted for the activities of its county societies. The majority of them publish their own bulletins. Many of them also plan to own their own buildings according to the following item from the December issue of the Atlantic Medical Journal.

"The October number of the Lyconing County Medical Bulletin is a 'Permanent Home Number' From its pages we learn that York County is making plans, Montgomery has a fund of \$5,000 for the project, Fayette is housed in fairly comfortable quarters at Uniontown Hospital, Lancaster will meet in the 'Home of Lancaster Medical Club,' recently purchased for \$11,000, and alterations are now under way, Berks paid \$20,000 for their home ten years ago, and it is now valued in excess of \$40,000, Luzerne, with a building completed about 1913 and now clear of debt, estimates its present value at \$40,000. Their library, under the guidance and care of Dr. L. H. Faylor, is already of good proportions

"Dauphin has outgrown her present quarters, valued at \$25,000, and has a committee on the lookout for a more suitable location. Philadelphia purchased a home in 1925 at a cost of \$125-

000, alterations, \$63,000, but recent real estate appraisement by two different viewers placed it at \$240,000. Allegheny County has a Committee on Permanent Home, and has accumulated a growing sum of money. Lehigh County is also active in this respect, has a committee at work, and we feel sure that its project will receive quite a boost after the next annual session. Lackawanna County has under active consideration the proposition of a medical-arts building for the medical society.

"We shall be pleased to hear of the activities of any other county society in respect to this laudable enterprise. In these days of financial prosperity it is well for all to put forth constructive work that shall result in permanent improvements, so that if lean days should come the pinch of money stringency would not be so keenly felt. In addition, the sense of pride that comes from ownership of a home brings out the best side of any men or group of men who may be so fortunately situated.

"We congratulate these many societies upon the splendid activities, and wish them great success"

TWENTY-FIVE YEARS AGO

California and Western Medicine, the organ of the Medical Societies of California, Nevada and Utah, announced in its November issue the adoption of the plan of the New York State Journal of Medicine to quote from the Journal of twenty-five years ago Concerning the appropriateness of beginning the new department at this time, the announcement says

"Twenty-five years ago the California Medical Association, then known as the Medical Society of the State of California, upon the nutrative of one of its younger members, the late Philip Mills Jones, established its official publication, the California State Jour

nal of Medicine

"The California Medical Association may well be proud of the vigorous manner in which its journal sprang into existence and for the valiant and efficient way in which it battled for a wide-spread organization of the medical profession and the elevation of the standards of medical education, licensure and practice.

"Its founder, Philip Mills Jones -for if this journal had a founder, he more than any other one man was its sponsor — was no mollycoddle type of man He was a clear thinker, a clever editor, a He was human, very human, both in his weaknesses and in his strength He made enemies, but he likewise had strong and devoted friends He was proud of the profession of medicine, loyal to its principles and to its members, and his beliefs, as printed in the columns of this publication, played a very considerable part in the upbuilding of our State Medical Society at a crucial time in its existence

"In November, 1902, just twenty-five years ago this month, Volume 1, No 1, of this JOURNAL was printed and mailed. The memory of our older members will carry back to that time in recollection of its advent among them. Yet how few, how very few among them have bound volumes thereof As a matter of fact, Volume 1, No 1, has even disappeared from

the file in our central office, and the editors would be glad to acknowledge the gft from any member who could again re-establish for the Association the complete sequence of the file of its official publication

"These remarks suggested themselves as a prelude to the introduction of a new column which is inaugurated in the Miscellany department of this issue, and which will appear under the caption 'Twenty-Five Years Ago'

We commend this column to our members both old and new It will harm none of us to know the stand colleagues who are still with us took on this, that and the other subject. And if it remind some of us who had the pleasure and honor of knowing some of the stalwarts who are no longer with us, of what was the attitude of those colleagues, now dead, on the issues of their day, that also will be good and heart-satisfying

For member colleagues who have not been long in California, and for recent graduates from both in and out our state, the column will be worthy of perusal as showing that twenty-five years ago the California Medical Association was functioning in much the same way as at present, with equally high ideals and record of good work, and that its members of that time, in measure equal to that of today, were performing their duties in civil and hospital practice, painstakingly, alertly, and by the standards and knowledge of their day, quite as scientifically and as efficiently as we do today who still carry on, whether we be members of this California profession a few or many years

"The Twenty-Five Years Ago-To-day column will be a quotation of what our colleagues at that time felt and did And because of such literal quotation it will be worth just that much more to all those who believe that a knowledge of the past makes for a better present and future"

The first installment of the new department fills nearly three columns with quotations from the editorial and news columns

LIVER FOR ANEMIA

The value of liver for anemia having been established, the question of how to get as much as possible of the liver element into the diet has become a problem for the physician

As the effect of the liver fractions is that of a motivating force, its presentation even in small quantities frequently

the medical profession.

The incorporation of the blood regenerating fractions of liver extract into a tonic is now attracting the interest of

the medical profession.
PHOS HEPATIC EXTRACT, a tonic stimulant containing beef liver extract in a palatable form, has been prepared for cases in which a general tonic and stimulant is indicated, furnishing as it does the stimulating influence of a high vitamin content, together with the red blood regenerative factors of the liver elements

DOSAGE

For adults 1 tablespoonful taken plain or in a little water 3 times a day For children one to two teaspoonfuls diluted with water See advertising page xix.

ADHESIVE DRESSINGS WITH-OUT STRAPS

Johnson & Johnson's newest offering to the medical profession is Duo Liquid Adhesive, which bids fair to revolutionize the dressing of all small wounds and many major ones

The Duo is applied with a fresh swab around or near the site to be dressed. Then a gauze or lint dressing of suitable size is placed over, and the wound is dressed! If the wound requires ventilation, apply the Duo only

in spots around the wound.

Duo is waterproof, not affected by secretions or excretions It adheres firmly to any body surface without previous defatting or other extra preparation Fine for scalp wounds Neat on the face, neck and other visible parts, for which patients are grateful

Write for your sample today to Johnson & Johnson, New Brunswick, You will find a hundred timesaving uses for Duo Liquid Adhesive.

WHY DRY MILK?

The production of clean milk is en gaging the attention of health authori ties to a greater extent than ever before. The heavy toll in lives which liquid milk has taken in the past and is still taking, notwithstanding many regulations and inspections by Health Departments, has called for efforts on the part of all milk producers to re duce this milk hazard

In 1893 pasteurization was first at tempted Pasteurization has done much to eliminate milk-borne infections How ever, in order to be safe, milk must be carefully pasteurized and health au thorities everywhere are taking steps to see that the pasteurization is carefully carried out This, of course, involves the human equation, and there are rec ords of many epidemics caused by milk supposed to have been pasteurized in which pasteurization has been faulty -Adv

DANGERS OF METASTASES FROM INCOMPLETE REMOVAL OF MALIGNANCIES OF THE SKIN*

By ALBERT R. McFARLAND, MD, ROCHESTER, N Y

THE subject of malignancy and metastases is anything but new. In fact, quite a considerable part of medical literature is made up of some phase of this subject. We believe there are, however, certain points in connection with the subject chosen which warrant additional emphasis.

About three years ago, I had the unpleasant experience of seeing a friend of mine die from carcinomatous metastases after I had treated a pigmented lesion on his foot. Since then, five other cases of a more or less similar nature have come under my observation. I wish, therefore, to review briefly the salient points in these six cases which will form the basis of my comments and conclusions.

J M, male, aged 28, was first seen in 1923 with a history of having sustained a stone bruise on the heel two years previously while in bathing A tender spot remained for some weeks after which it apparently cleared up for about a year A pigmented calloused area then developed which had gradually spread to the size of a silver dollar and which was slightly tender upon walking Examination showed a dusky purplish area about 4 cm in diameter on the heel and sole of foot. It was irregular in outline and slightly tender on hard pressure Hemangioma, nevus and sarcoma were considered in the differential diag-A section was removed and sent to Buffalo, where a diagnosis of nevus was thought most likely In view of this, radium applications were used The lesion responded well and seemed to be practically clear in February, 1924, about one year after the onset of trouble, except for one small area the size of a pea. It was intended to apply more radium when the patient began to complain of severe headaches Examination of the fundus showed 2 diopters choke disc and the neurological examination showed some abnormalities He went to Johns Hopkins,

* Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls, N Y May 10 1927 where a diagnosis of brain tumor was made Strange as it may seem the primary lesion on the foot was not even taken into consideration in spite of the fact that there was inguinal adenopathy. An operation was performed which revealed an inoperable brain tumor. The patient died a few days post operative, and autopsy showed extensive metastases in the brain, liver, mesenteric and inguinal glands. Microscopic diagnosis was melano carcinoma.

Case 2 Mrs F T, age 58, was first seen in March, 1925, complaining of a growth on the dorsum of the foot She stated that she had had a black mole in this area for several Within the past year it had been rubbed by her shoe lace and had become ten-Examination showed a verrucous pigmented area on the dorsum of the foot about the size of a half dollar The center was beginning to break down and ulcerate inguinal glands were palpable Because of the rapid growth and tendency to ulceration, it was thought probably to be malignant Biopsy was considered inadvisable, but the entire lesion was coagulated by diathermy, going well beyond the margin of the growth The slough separated and healing took place in about six weeks Two months later she returned with a small pigmented recurrence about the size of a large pin head at the margin of the scar This was destroyed by diathermy About six months later I was called to her home because she was vomiting blood A gastro-enterologist was consulted who thought a gastric ulcer likely. She was put to bed and morphine administered She gradually became cachectic, was unable to retain food, and died three weeks later was not obtained, but before death definite inguinal adenopathy was noted I have no doubt but that she died of abdominal metastases from the lesion on her foot

Case 3 W M, male, aged 60, came to the office in October, 1925, with the history of having noticed what he called a wart on the

scalp just below the occiput. It became irritated in combing his hair, and after having it cauterized by a barber, went to a chiropodist who used electrolysis but did not succeed in removing it Following this, the lesion enlarged until when seen first by me it was an irregular thickened patch about 2 cm in dia-No glands were palpable in the cer-The lesion was destroyed by vical region diathermy and a specimen sent to the Buffalo Cancer Clinic A report was returned of carcinoma containing pigment The lesion healed locally and was followed up by X-ray treat-In March, 1926, five months after operation, he returned with large glands on both sides of the neck One of these was removed and found to be malignant therapy was applied to the neck, but the patient died several weeks later in a cachectic condition and evidently with widespread metastases

Case 4 P F, male, aged 38, was referred to me in February, 1925, because of a small pigmented area just in front of the left ear at the hair margin According to the history, he had had a small pigmented area there for about 15 years Six months prior to consulting me, he had noticed it beginning to grow, and had gone to his family physician, who had excised the entire area. A report on the specimen from the Buffalo Clinic was pigmented carcinoma Shortly afterward there was some recurrence in the scar When I examined him, the entire lesion was not more than quarter of an inch in diameter. I used bipolar diathermy and there was no recurrence locally I did not see him again for about eight months, when I accidentally noticed him while making rounds in the wards of one of the hospitals I looked up his chart, and much to my surprise, found that the diagnosis was metastases of the lungs He had been admitted complaining of dyspnoae developed a mass in the upper abdomen and Autopsy showed metastases in practically every organ of the body Until I called the attention of the attending physician to the scar on his temple, which showed no evidence of recurrence, it had been a mystery where the primary focus was located In fact, it had not occurred to the patient himself to mention to the admitting physician the fact that he had this "mole" removed

Case 5 Mr J T, aged 59, was seen November, 1926, presenting a mass of glands in the left axillo Eight months prior, his physician had excised what was called a "black mole" on the top of the left shoulder At the time of examination, there was apparently no recurrence at the site of this lesion, but the scar was somewhat keloidal One of the axillary glands was removed and found to be

a melano carcinoma X-ray pictures of the chest showed probable metastases to the left left lung Deep X-ray therapy was instituted as a palliative measure The patient is still alive, but no doubt will eventually succumb to the disease

Case 6 Mr L, aged 61 Gave a history of having had rough, scaly lesions on the backs of his hands for many years In 1924, one of the lesions began to grow and was slightly tender He went to a physician who cauterized it with nitric acid. It did not heal and it was then treated about six months later by X-ray Response was unsatisfactory and an attempt was made to destroy it by bipolar diathermy About the time healing was complete a small nodular recurrence was noted at the border of the scar Up until this time no axilliary adenopathy could be palpated now had, however, very definite glands in the axilla One gland was removed which proved to be carcinoma on frozen section The surgeon then proceeded to do a radical operation and cleaned out the axillary space and amputated the hand Three months after operation there is apparently no recurrence, but the outcome is, of course, doubtful

While this series is not large from a statistical point of view, yet it is quite formidable for an observation period of three years. In fact, it is a series which recalls very vividly to my mind a group of untimely and very tragic deaths. Two of these cases were among my own personal friends and the subject has, therefore, so impressed me that I hope to bring out some points by way of discussion which

may be helpful in the future

In the first place, it is to be noted that all these lesions, with the exception of Case No 6 were pigmented The clinical appearance varied in the different lesions, but the common factor of pigmentation was present. One resembled a birthmark, two a mole, one simply a brownish patch and one a verrucous ultera-This, I believe, should impress us tive mass with the potential malignancy of pigmented growths of any character By way of comparison, I may state that during this threeyear period of observation, with the exception of case No 6, I do not recall a single case of non-pigmented epithelioma of the skin surface which has resulted in metastases or death following attempt at removal

A second factor which these cases had in common is that all had been more or less ineffectually tampered with. One was treated by radium after a faulty diagnosis based upon clinical appearance and laboratory findings. One was treated by diathermy without leaving a wide enough margin at the periphery. One was cauterized by a barber and later treated by a chiropodist. Two were biopsied

and later excised by the scalpel, and one was cauterized by nitric acid. I am well aware of the fact that it is often difficult because of the location to completely destroy a given lesion and it is also easy for the physician to minimize the importance of innocent looking cutaneous growths, but I do feel we are playing with fire when we ineffectually tamper with these pigmented lesions. Let them alone or do a complete job

In the third place, this series would tend to show us that most of these pigmented lesions are slow growing if not irritated. All of them had been present for years before they showed any signs of activity. The basal or even squamous cell epitheliomas of the skin usually give warning by a fairly rapid local growth which attracts the attention of patient and physician and usually an effectual removal is accomplished before metastases occur. This series of pigmented lesions, however, have laid dormant for years and then with slight provocation have struck like the copperhead before anything could be done.

In the fourth place, it will be noted that there is little relation to age incedence in this series. The cases are about evenly distributed between the ages of 28 and 61. Basal cell, squamous cell and basal-squamous cell epitheliomas of the skin are more commonly found in the later decades of life, but the pigmented carcinoma starting in the mole, nevus or pigmented patch may occur at any age

All the cases in this series were found pathologically to be carcinoma and not sarcoma. The melanotic sarcoma arises from deeper tissues, starts without any provocative factor and is usually very malignant from the onset. These melanotic carcinomas however are superficial, may be dormant for a long time and appear to be very innocent lesions, but when irritated may metastasize rapidly

In closing, let me say it would seem to me advisable that great caution should be used in treating pigmented lesions of the skin. I do not doubt but that the dermatologist, seeing a large number of various kinds of pigmented lesions, eventually develops an intuitive sense which helps him to tell on sight the obviously malignant and the obviously benign with a fair degree of accuracy. However, there are certainly border line cases where this cannot be done. At least we feel that if we do decide a certain lesion should be removed, it should be destroyed very thoroughly and not irritated by ineffectual methods of treatment.

THE DOCTOR AND THE INSURANCE ADJUSTER *

By ALBERT L HALL, M.D, FULTON, N Y

PERSONAL experience compels admission that too much friction exists between physicians who engage in compensation practice and the adjusters who represent the insurance carriers, which might be avoided if proper consideration were given by both to the cause of their misunderstandings

The adjusters have certainly been very patient with the physicians, most of whom fail to comply with the requirements of section 13 of the Compensation Laws, which in part provides as follows "Nor shall any claim for medical or surgical treatment be valid and enforceable, as against such employer, unless within twenty days following the first treatment the physician giving such treatment furnish to the employer and the Industrial Commissioner a report of such injury and treatment, on a form prescribed by the Industrial Commissioner"

A considerable number of physicians have been interviewed with the result of finding that not one of them have complied with the law in the filing of their reports as attending physicians in compensation cases Their usual

*Read at the meeting of the Fifth District Branch of the Medical Society of the State of New York at Watertown, N Y October 14 1927

practice has been to wait until blanks from the office of the insurance carrier have been received for the making of these reports, which, when completed, they have quite invariably filed with the carrier and, as invariably, omitted to file with the employer and the Industrial Commissioner, as required by section 13 of the Compensation Act Many times these blanks have not been received by the attending physicians until considerable time has elapsed and in some instances, which have come under observation, the twenty day period for filing has passed and the physician relying upon the carrier for the necessary blanks has failed to comply with section 13 and his claim for services is not legally enforceable.

On page 117 of Special Bulletin No 140, issued by the Department of Labor December, 1925, the following case is cited as exemplifying the status of the physician with respect to the filing of his report as attending physician in the case of an injured employee under the Compensation Laws

"On August 9, 1924, a girl employee in a dressmaking establishment fell over a broken water bottle. It gashed her right leg, severing tendons and causing her foot to drop Her employer's physician authorized the serv-

scalp just below the occiput. It became irritated in combing his hair, and after having it cauterized by a barber, went to a chiropodist who used electrolysis but did not succeed in Following this, the lesion enremoving it larged until when seen first by me it was an irregular thickened patch about 2 cm in dia-No glands were palpable in the cer-The lesion was destroyed by vical region diathermy and a specimen sent to the Buffalo Cancer Clinic A report was returned of carcinoma containing pigment The lesion healed locally and was followed up by X-ray treat-In March, 1926, five months after operation, he returned with large glands on both sides of the neck One of these was removed and found to be malignant therapy was applied to the neck, but the patient died several weeks later in a cachectic condition and evidently with widespread metastases

Case 4 P F, male, aged 38, was referred to me in February, 1925, because of a small pigmented area just in front of the left ear at the hair margin According to the history, he had had a small pigmented area there for about 15 years Six months prior to consulting me, he had noticed it beginning to grow, and had gone to his family physician, who had excised the entire area. A report on the specimen from the Buffalo Clinic was pigmented carcinoma Shortly afterward there was some recurrence in the scar When I examined him, the entire lesion was not more than quarter of an inch in diameter. I used bipolar diathermy and there was no recurrence locally I did not see him again for about eight months, when I accidentally noticed him while making rounds in the wards of one of the hospitals I looked up his chart, and much to my surprise, found that the diagnosis was metastases of the lungs He had been admitted complaining of dyspnoae He later developed a mass in the upper abdomen and Autopsy showed metastases in practically every organ of the body Until I called the attention of the attending physician to the scar on his temple, which showed no evidence of recurrence, it had been a mystery where the primary focus was located In fact, it had not occurred to the patient himself to mention to the admitting physician the fact that he had this "mole" removed

Case 5 Mr. J T, aged 59, was seen November, 1926, presenting a mass of glands in the left axillo Eight months prior, his physician had excised what was called a "black mole" on the top of the left shoulder At the time of examination, there was apparently no recurrence at the site of this lesion, but the scar was somewhat keloidal One of the axillary glands was removed and found to be

a melano carcinoma X-ray pictures of the chest showed probable metastases to the left left lung Deep X-ray therapy was instituted as a palliative measure. The patient is still alive, but no doubt will eventually succumb to the disease

Case 6 Mr L, aged 61 Gave a history of having had rough, scaly lesions on the backs of his hands for many years In 1924, one of the lesions began to grow and was slightly He went to a physician who cauterized it with nitric acid. It did not heal and it was then treated about six months later by X-ray Response was unsatisfactory and an attempt was made to destroy it by bipolar diathermy About the time healing was complete a small nodular recurrence was noted at the border of the scar Up until this time no axilliary adenopathy could be palpated He now had, however, very definite glands in the axilla One gland was removed which proved to be carcinoma on frozen section The surgeon then proceeded to do a radical operation and cleaned out the axillary space and amputated the hand Three months after operation there is apparently no recurrence, but the outcome is, of course, doubtful

On page 117 of Special Bulletin No 140, issued by the Department of Labor December, 1925, the following case is cited as exemplifying the status of the physician with respect to the filing of his report as attending physician in the case of an injured employee under

the Compensation Laws

"On August 9, 1924, a girl employee in a dressmaking establishment fell over a broken water bottle It gashed her right leg, severing tendons and causing her foot to drop Her employer's physician authorized the services of three other physicians for treatment of Two of these physicians failed her injuries to file the required report (Form C-4) and one furnished it after the expiration of the twenty-The girl's father paid their bills. aggregating \$1,00700, in full and the Board awarded the amount to him against the employer's insurance carrier along with some other care and treatment expenses Upon appeal by the carrier, based upon the physicians' failure to report, the Attorney-General contended that physicians recommended and authorized by the employer, through its physician or otherwise, are not obliged to make the report, that only physicians procured by the employee in event the employer fails or neglects to provide care and treatment need make the report and that the twenty-day provision is directory rather than mandatory, otherwise it might be unconstitutional as depriving a party of property without due process of law"

"The carrier argued that, on the contrary, the provision for report is a mandatory limitation properly imposed in the effort to cure a notorious evil in compensation practice and that it is applicable to all physicians, whether (a) provided directly by the employer, (b) authorized, i e either called in by the employer or by the employee on the authority of the employer, or (c) self-selected by the employee, without the intervention of the em-

ployer at all"

"The Appellate Division sustained the carrier's contention by striking out the physicians' bills and affirming the award as thus modified

with per curiam opinion"

"Upon further appeal, the Court of Appeals on Jan 22, 1926, affirmed the Appellate Division's order, not upon the ground that the physicians had failed to report, but upon the ground section 13 does not permit award to an employee for medical treatment furnished by the employer"

The Appellate Division's opinion is as follows

"Sandberg v Seymour Dress Co, 215 App

Div 728, Nov 20, 1925

"Opinion Per Curiam Under section 13 of the Workmen's Compensation Law no claim for medical or surgical treatment is enforceable, except (1) as incidental to, or a part of, an award to an injured employee, and (2) unless, within twenty days following the first treatment, the physician or surgeon furnishing the treatment shall furnish to the employer and the Industrial Board a report of the injury and treatment on a form prescribed by the Industrial Board This applies to every claim by a physician or surgeon for services rendered to an injured employee, payment of which is sought through an award by the Industrial Board and whether employed by the employer or employee, this, of course, has no application to the right of a physician or surgeon to recover at law from the employer for services

rendered at his request"

"Award modified by striking therefrom the amounts awarded as compensation to the claimant on account of medical bills of physicians, as follows Dr Roth \$185. Dr Roth \$20, Dr Grossman \$75, Dr Grossman \$400, Dr Schwartz \$327, and as so modified unanimously affirmed"

The physicians were paid by the girls' father, in full, and the court decisions, which upheld the carrier's contention that every physician furnishing treatment to an injured employee must, within twenty days, furnish to the employer and the Industrial Board a report of the injury and treatment on a form prescribed by the Industrial Commissioner, in nowise adversely affected their interest, but showed that their laxity in failing to file the attending physicians' report within the twenty day period had deprived the father, who paid their bills, of legal redress for the amount expended

The carrier characterized the failure of physicians to file their reports "as a notorious evil in compensation practice" which the statute Whether the action of the sought to cure carrier was a bona fide attempt to cure this evil or to evade payment of a liability, through legal technicality, may fairly be questioned The fact is that the legal technicality is in the law and the adjuster may use it to the carrier's advantage whenever an opportunity of-It, therefore, behooves the physician to comply with the requirements of section 13 of the Compensation Law and not rely upon the insurance adjuster to file copies of his report with the commission, as now, is the almost universal custom to the exclusion of the employer who is legally entitled to such report, but he should file them with the employer and the Industrial Board within the twentyday period He is not legally bound to furnish the carrier with such report Undoubtedly, it is to the physicians' interest to file a copy of his report with the carrier However, he should not rely upon the adjuster to perform a duty which the statute requires him to per-He should file his reports with the employer and the Industrial Board within the twenty day limit, if he would protect himself

Further, the physicians' report must be "a report of such injury and treatment on a form prescribed by the Industrial Commissioner" In attempting to literally comply with this requirement, the physician finds himself up against a barrier. He must make his report on a form prescribed by the Commissioner Several years ago, this form, known as C-4, called for a brief outline of the treatment

Now, this form does not call for a statement of the treatment and if you would conform fully with the requirements of section 13 you should insert, somewhere on Form C-4, a brief description of the treatment. If you do not, you run the risk of whatever detrimental consequences may follow the omission are friendly with the adjuster he will not obstruct or interfere with the payment of your bills for services for failure to comply with section 13 in detail. On the contrary, he may not insist upon your filing a report as required by section 13 If, however, you have antagonized the adjuster by standing for a deserving claimant in a controversy before the Industrial Board you may find that he will hinder or prevent, if possible, the payment of your bills for services and in some instances he has been known not to hesitate to resort to dishonest and tricky methods to accomplish his purpose There are honest and dishonest adjusters just as there are honest and dishonest claimants and physicians If the dishonest adjuster and dishonest claimant could be eliminated there would be no field for the dishonest doctor, but just so long as dishonest adjusters and dishonest claimants exist there will always be The disroom for the dishonest physician honest adjuster will find, without much seeking, a dishonest doctor who can easily fail to visualize the extent or degree of the employee's disability and return him to work at an earlier date than his disability warrants The carrier will thus early relieve himself of the burden of compensation payments and shift the load to the shoulders of the employer who finds employment for a workman who cannot fully earn his wages This practice is a very prevalent one and is made possible, largely, by inducing the employer to send their injured employees to a physician who favors the carrier and who directs the workman to resume work sooner than he ought to physicians are known in insurance circles as preferred physicians, a few of whom may be found in almost any small city, and if they cannot be found, in some instances, the adjusters have been known to offer inducements to physicians of their choice to locate there The dishonest claimant and the dishonest

The dishonest claimant and the dishonest doctor may for a time successfully elude detection and swindle the insurance carrier, but not for long Sooner or later they are found out and are eliminated, as they should be

The majority of adjusters are undoubtedly honest and upright in their methods and the same can be said of claimants and doctors. It is the dishonest ones who interfere with the successful administration of the Compensation Laws and resort to dishonest methods. The ones who usually suffer most from such methods are employees who have received in-

juries which ultimately culminate in a continuing disability of long standing and which must necessarily require the payment of large compensation awards. It is this class of cases which the insurance adjuster seeks to "unload" and he sometimes makes use of questionable methods to accomplish it. In such cases he may call in his trusty medical experts to aid him. Apparently, he does not find any real difficulty in obtaining physicians who readily come to his assistance and who are willing to furnish testimony which shall relieve the carrier from the payment of long continued compensation

Again, they may seek to unduly influence the State Examining Physicians and that they do so in some cases to the disadvantage of the claimants is apparently true. The same, also, may be said of some of the Referees, who in many ways can lessen the burdens of the carriers at the expense of the disabled employees. However, there are honest referees who protect the interest of the employee and prevent injustice being done to him

The Industrial Board has rendered a decision to the effect that the insurance carrier has no voice in the selection of the physician which has been unanimously affirmed by the Appel-That some of the carriers do late Division have a voice in the selection of the physician They induce the employer is beyond dispute to call certain physicians who are known to favor them when injuries are sustained by any of their employees and the employers post the names in their plants of the physicians designated by the carrier which the employees are directed to call in case of injury In many instances, where prolonged disability is liable to occur, the adjuster writes the injured employee requesting him to visit the carrier's physician for examination and further tells him to come to his office and he will be given his transportation expenses If he goes to the carrier's physician he may be told not to return to the physician who has been designated by the employer, but directed to another physician who is more to the liking of the carrier Sometimes the employee complies with the carrier's request and goes to the physician whom the carrier designates, and sometimes he refuses to do so and returns to the physician who has been treating him. In the event he does not comply with the wishes of the carrier he incurs the displeasure of the adjuster who may cut off his compensation and cause him to be subjected to other annoyances This is not an infrequent occurrence. In every instance of this kind the adjuster has usurped the authority conferred upon the employer by section 13 of the Compensation Laws State Industrial Board should prevent such interference as this and discipline the adjuster

who may undertake it If the insurance carrier was given to understand that its license would be revoked if it permitted its adjuster to interfere with the physician designated by the employer to treat one of his injured employees this practice would be effectually stopped

There can be no question, but that most of the physicians of this State are properly equipped and competent to render any service ordinarily required to properly treat an injured employee and the efforts of the adjuster to have the injured employee treated by a physician whom they may induce the employer to call are specious and are intended solely for the benefit of the carrier and naturally work to the injury of the employee in more ways than is generally known or suspected

This subject is too broad for more than a cursory presentation under the limitations imposed by the rules of this Society and I leave it with the feeling that it has not been handled as it should be, and might be, if ample time were accorded However, I hope that it may be productive of some real benefit to those who have listened to it and may have been instructive concerning some features of medical compensation practice

DOES PSYCHIATRY NEED HELP?*

By HERMAN G MATZINGER, MD, BUFFALO, N Y

T is not overstating facts, nor is it extravagant praise to say that of all the learned professions, medicine has made more real advance and served the public better than any other. It is also true that progress is continuing to be made in the scientific study of the nature of disease as well as in its prevention and cure. Extraordinary things have been accomplished which have not only enhanced and prolonged life, but which have made possible much of the advance in our civilization.

But this eager quest has led the profession so far into the scientific study and investigation of disease processes, so fascinating in themselves, that it has all but lost sight of the important fact that the pathological processes are going on in a thinking, feeling organism, thrown out of gear, anxious to return to normal functioning and to again take its place in the normal order of things Conscious of dangers ahead and valuable time lost, the patient is not interested in the scientific demonstration of why he is ill, nor does he desire offering himself for special investigation and later verification by autopsy He wants to get The physician usually comes to a realization of this when he himself or a member of his household becomes ill, while too often his hospital work is purely scientific or perfunctory

To understand this one needs but to recall how profoundly the emotional state affects physiological functioning in the normal human being in the way of raising or depressing the level of activity of the entire body through the influence of the sympathetic nervous system. The entire autonomic system seems to be sensitive and responsive to the emotions

This mental side of sickness has been deplorably but quite unavoidably neglected in the scientific drive which has so long monopolized medical thought and endeavor. We hope that before long,

*Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls N Y, May 11 1927

when the medical profession will be forced to become interested in human behavior by the insistence of the psychiatrist, the emotions and their part in human disease and its cure will also get scientific attention. When this time comes, physicians will find that the intelligent public will be ready and that the psychologist will be able to offer him all the necessary data on normal behavior for his study.

The natural result of this present day attitude is the prevailing lack of interest in and even neglect of mental diseases and the borderline disorders, in which, up to date, no distinctive pathology has been demonstrated. The scientific trend is still focused on the trail of bacterial and chemical, more or less localized tissue change. This is, of course, important, but why not investigate some other leads as well?

Few physicians know anything about the prevalence of mental disease They exhibit surprise and incredulity when told that the last United States census shows that at least as many beds-perhaps more—are supplied in hospitals of this country for the care and treatment of mental diseases as for all other diseases combined citizens of this state know that the cost of maintenance of our state hospitals amounts to 1/12th to 1/13th of all money expended by the state, and is the second largest item of cost in the entire Only the Educational Department costs It must be remembered that not all menmore tally diseased and disordered citizens are to be found in the state hospitals Many are in retreats, private hospitals, sanatoria, or health resorts and we all know that many are at large who should be under care and supervision Then there are the borderline cases, the psychoneurotics of various types, whose needs are rarely understood and properly met, until they have been in the hands of surgeons, specialists and cultists before they are referred to a psychiatrist or are

committed It is plain that psychiatry needs help here

Your attention is called to the singular circumstance that the mental training of our children and the care of those who are losing or who have lost their mind have become our greatest expense. Is there any relation between them? Is it possible that there are defects in the former which open the way for the development of the latter?

There are now at hand and recorded a sufficient mass of studies of human conduct to draw the conclusion that personality is made up of learned or conditioned reactions on the part of the individual to his environment and to his organic needs The manner in which such habits of adjustment have been made and the kind of integration of the dynamic forces of the body which has thus been accomplished, determines not only personality but also the somatic and psychic status of the body It is fair to assume that for many and obvious reasons this integration, this formation of a personality, which becomes the individual's stock in trade in meeting the unusual as well as the ordinary situations of life, is not well done. In consequence there is danger of personality disorders which become apparent or are developed, so commonly, in the child's school experience Breaks and splittings now open the way to the schizophrenias, real mental disorders and common ones, which psychoanalists have shown to be all too frequently begun or induced by misunderstandings and maladjustments in the primary grades and on throughout grammar school past puberty into the high school Very often the individual manages to make some temporary adjustment early, but can not weather the pressure of new urges and new needs of a different kind of adjustment which comes at puberty and characterizes the adolescent period which is shot through with emotional unrest

In the nature of things there is very little opportunity to study personality and to evaluate child conduct in a system which demands that a teacher pass a certain proportion of pupils into the next grade each year—like so much material going through a mill to be delivered as a finished, standardized product at the expiration of a certain period of time and at a fixed cost.

It must be admitted that educators are aware of this defect of our school system. Especially is this true among those concerned with higher education. They have found that the results obtained by educational training as it is administered now, are on the whole disappointing. So often our most valued citizens come from a group who have had little early advantage to go to school or to get a systematic education and yet they outstrip the others and occupy positions of trust, responsibility and honor in much greater proportion than is obtained from the educated

With this in mind, educators are trying out new methods and plans to meet this situation They know that there is something wrong with the system Private schools are doing much valuable experimental work in the hope of discovering some better way to prepare the coming generation for better citizenship and for greater success in the pursuit of happiness Much of education has been little better than animal training in which the objective was the acquisition of some certificate or diploma which the general public was willing to recognize as a symbol or proof of having completed a certain course of training, not unlike the hall mark of ancient guilds and which has become as popular and useful as a trump card

We are witnessing, at the present time, what might be called a revival of learning which is primarily conditioned by this artificial value placed on the worth of such credentials Applicants for such competition far outnumber our facilities To meet this discrepancy, standards are raised and admission put out of the reach of any but those who have been thoroughly licked into shape by the system and have or can obtain the required certification In the exposure to this system and the stigmatizing effects of failure to become docile and receptive like a sponge with readiness to disgorge on pressure, inferiority complexes with revolts and rebellion develop and mental disorders become common Psychiatry needs the support of the medical profession here in an effort to salvage the minds of human beings and to assist in the reorganization of educational methods

But the schools are not by any means entirely to blame. To them comes annually a heterogeneous mass of children, from all kinds of homes, with and without traditions, principles or ideals. In the fewest of them is there any interest in or plan of training the child and teaching good habits of adjustment and emotional poise. Almost all of this is too commonly left for the schools to do

It is well understood now that all the basic habits which determine successful human behavior in the later years are begun and established in the first six years of life How many homes are there in which this is likely to be well The problem child comes from homes that fail in this training for personality In too many homes, any form of coercion may be substituted for thoughtful time consuming unselfish interest in the child's personal difficulties and needs In these days of emancipation real homes and real family life are passing Long before the children are well started, a large proportion of homes are broken up by separation and by divorce after long periods of domestic troubles which the child hears and sees What chance is there, under such circumstances, for developing a personality which will be of help in meeting the

difficult situations of life? Here again the way is opened for developing not only unsocial and anti-social habits, but for mental disorders and disease as well. The entire matter of juvenile delinquency with all its cost to society and misery for those concerned, hinges on early home care and training. Psychiatry needs help here from the family physician who comes in more immediate and frequent contact with early behavior problems in the home.

Heredity must, of course, be considered as a factor in the incidence of abnormal conduct and mental disease. Heredity determines a potentiality, but is by no means as important a factor as environmental influences in producing unfavorable results.

Children are born with a definite stock in trade of intelligence and emotions and with them, environmental influences work to produce behavior The big thing in heredity is the amount of intelligence with which a child is born Intelligence determines common sense behavior and can not be increased by any system of education, but is susceptible of development within its limitations If this were recognized, educational methods would be made so flexible that the special needs of each child would be more nearly met and so be better prepared to live a useful and successful Moreover, there would be a much smaller number of failures, insane and criminals now intelligence can be measured and the emotions will soon be well enough understood to be properly evaluated Whatever advance in educational methods may come will depend largely on psychiatric study and observation of behavior reactions between intelligence and emotions on the one side and environmental conditions on the other

This calls for psychiatric clinics, nursery schools and behavior study in the primary grades. All such work, at least its supervision, belongs to the medical profession. There are too few psychiatrists to man the 30 clinics, in as many large cities, which are now doing work. Only a very small number of the balance of the medical profession know the first thing about or show the slightest interest in it. Yet they must depend upon individual intelligence for the success of their campaigns against physical disease and in their efforts to prevent disease. Legislation can do little to help us here, if there is no intelligent public.

The reason why the medical profession has shown so little interest in mental disorders and human behavior as a whole is the ancient and arbitrary division of functions and diseases into two groups—mental and physical—each independent of the other. Today we think of the mind as a body reaction, or the effect of the combined effort of all the dynamic forces of the body in adjusting it to conditions inside and outside of the body. We think of man as an organism with

more or less perfectly integrated functions, and which act as a constructive or destructive unit No part action being possible without in some way involving, to a greater or lesser degree, the rest of the body

Unfortunately the average physician, though he knows his anatomy and physiology well, can not yet get the idea of the body being like a highly complicated machine, in which all the sources of power are or should be so perfectly integrated that they function as a unit. If he did, he would be keenly interested not only in mental mechanisms and human conduct, but also in prevention and treatment of mental disorders. All illness involves the so-called mental functions and they are always part of the disease picture.

Once the physician becomes as interested in regulating mental functions as he is interested in regulating organ functions, he will gain a control over disease which he has not dreamed of before He will add to his knowledge of physical hygiene as much as he can have of mental hygiene and so get a better understanding of the protective as well as the constructive forces of the body

Every thoughtful observer must be aware that there is in progress today, what seems to be a reorganization of society Ever since the world war there have been startling dislocations of human conduct Old and tried methods of adaptation and restraint are ignored or forgotten and in their place have come what seem planless adventures in living Everyone is involved in this apparently reckless and thoughtless desire for more freedom in the pursuit of happiness manity seems to be breaking through the barrier of "thou-shalt-nots" and appears to be reverting to the more direct and primitive ways of reacting without conditioning the response Most of us are busy rationalizing our own indiscretions and departures from the beaten track, while we stand apart, screened by a thicket of pretenses, watching the reckless procession of emancipated humanity rush by, we know not whither

In our profession only the psychiatrist is interested in studying this movement in a dispassionate, perhaps scientific way. He is certain that in such a widespread readjustment there will, in the nature of things, be much need for mental hygiene, skilful and in preventing failures and breakdowns and wise treatment of so-called mental diseases. Plastic youth, still able to learn new ways of integration of habits will make the grade, but in many past 25 or 30, when the plaster is set, there will be serious breaks of personality and melancholy despair.

In all these matters, so vital in the further progress of civilization and so pregnant with possibilities for mental and physical disease and disorders, the medical profession should become more interested and aid the psychiatrist by diverting some of its interest in technical controversies, in laboratory methods and scientific interpretation

of disease processes, into the study of mental mechanism, human conduct and mental hygiene

We have temporarily lost sigh of the ancient aphorism sit sana mens in corpore sano, and are still treating mind and body as separate almost unrelated battle fields of disease existing together as tenant and host This can only be changed by demanding of the prospective medical student a fair knowledge of psychology as a requisite for admission, by adding to the study of organ and tissue physiology a course in psycho-biology, which will acquaint the student with the functions of the body as a whole, as an organism which is trying to adapt itself to difficult and often unfavorable environmental conditions in its desire to live successfully and to have descen-It will further teach him that such commonsense action is predicated by normal intelligence and is the evidence of mind If this can be done right, the student will not be hypocritical

about psychiatry and mental disorders in general but will appreciate the inter-dependence of mental and physical phenomena in health and disease

Surely psychiatry needs help—Its sphere of work is rapidly broadening and growing in importance so rapidly that the physician of the future must be a good psychiatrist—When this comes about, the incidence of mental disease will be controlled, education will become more human, more sane and more practical and the law will be shaken out of its archaic ways of dealing not only with the so-called insane, but in interpreting abnormal human behavior in general

If the medical profession will realize these immense responsibilities and obligations and try to prepare its coming members to meet them, it will not only conserve and perpetuate its good reputation for invaluable altruistic public service, but deserve more

THE DANGERS OF SURGICAL MOVIES AND HOW TO AVOID THEM By JACOB SARNOFF, MD., BROOKLYN, N Y

VERY new and useful invention brings with it some dangers which one must guard against In order to obtain the greatest benefit from such devices with the least possible harm, time and experience tend to outline methods, rules and regulations in order to guard against such dangers The automobile, the aeroplane, the radio and the cinema well exemplify this principle No one questions their great aid to civilization in the work accomplished and the pleasures derived. However, the loss of life and limb in the former and the liquidation of morale in the latter would be appalling were it not for the judicial methods instituted for their preven-The traffic cop and the speed laws, the movie censor and the radio commission, all dictated by the public sense of decency, are safeguards in that direction

What has all this to do with the title of the subject? In the latter part of the last decade, great strides have been made in the teaching of subjects requiring visualization by means of motion pictures. Anatomy, physiology and surgery naturally furnish the most fruitful field in that direction. What can be more lucid than the action of the living heart as seen at normal rate and in slow motion and how much easier can anatomical dissections and operative procedures be followed by means of motion pictures as compared to the mere descriptive text?

The adoption of motion pictures for teaching purposes has been slow in its progress. Only a few years ago when the writer became enthusiastic over the production of a series of films "The Human Body in Pictures," to demonstrate the anatomy and physiology of the human body,

he was met with a great deal of criticism and even ridicule. As an instance, before these films were accepted in the various schools and colleges of this country as well as in foreign lands, one of my colleagues, a surgeon of prominence and chief of the surgical department remarked. "I would advise you to give up the movies before the medical societies question the ethics of medical motion pictures," to which I replied, "I am willing to stand the consequences, believing as I do that such methods of teaching will become practical and of great importance." It is the belief of the writer that it was the first time a systematic study of anatomy and physiology had been presented by the combined aid of anatomical dissections, animated drawings and the action of living organs.

Now after a lapse of five years, we hear of great enthusiasm among the medical profession about films of this nature and the eagerness to develop visual texts in the form of motion pictures on the subjects of surgery The best example of such interest is the establishment of a special department by the American College of Surgeons in conjunction with the Eastman Kodak Co to develop such films The committee is composed of men of international prominence in their respective fields such as Will Hays, Mayo, Crile, Martin, Squier, etc Even the lay press is devoting many columns to the discussion of this Frequent statements such as "The subject Mayos are to perform operations which are to be filmed for teaching purposes" are cited

As one of the pioneers in that field, I greatly appreciate its many advantages, but am also aware of its shortcomings and dangers. The purpose of this short discussion is to point out these

difficulties and to show how they may best be obviated

No one will question the fact that anatomical movies are best obtained from dissections on the cadaver. But what about operative procedures? Should they be filmed from actual operations performed on the living or should they be obtained from the same operations performed in the anatomical laboratory—the dissecting room—whenever feasible? Before answering this query, let us take up the difficulties as well as the advantages encountered by both

The advantage that one may claim for filming actual operations is that the surgeon and assistants are accustomed to the regular routine of asepsis and technical procedures. Also that the pathological findings are real and therefore impressive. But what about the difficulties and disadvantages especially in so far as they concern

the patient?

No one in the medical profession would be accused of human vivisection nor would such be In order to obtain the proper filming, it is necessary to have an unusual amount of light, a full and clear exposure of the field of operation and slow and deliberate surgical technique, all of which are not as a rule conducive to the best interests of the patient. The intense light tends to injure the exposed tissues, the proper exposure demands at times unnecessary large incisions and the slow and deliberate motions are time consuming, all of which work to the detriment of the wound and the patient In addition to these, the field of operation is quite often obscured by the oozing of blood, the drapings, the instruments and the hands of the surgeon and his Also, the camera cannot always be placed in the best position for filming because of the fear of contamination

What is the result? Of the many surgical films which the writer has seen taken from actual operations, very few indeed, except for their animated portions, are clearly portrayed. In most of them the light is poor, the field of operation is not in clear view and the technique of the surgeon is not of as high a standard owing to the strain and difficulties incident to the filming of the picture. What is the solution?

Many of the shortcomings and dangers may be obviated by filming these operations on the cadaver. One may then have all the necessary light, ample incisions with proper exposure, no bleeding, deliberate motion and proper position of the camera for filming the various steps of the operation. Operations such as tendon transplantation, bone grafting, amputations, intestinal anastomosis, gastric resections, repair of hernias, removal of gall bladder or appendix, rib resection, hysterectomy, oophorectomy, vaginal repair, etc., all can thus be clearly shown to the great advantage of the student and teacher without any risk to patient or legal complications to surgeon

Certain phases of operative procedures and findings however, especially those showing pathological conditions, are best filmed from the living This should be done in order to clearly demonstrate the pathology, whether it be an inflamed organ, a traumatized structure, a new growth or an anomalous condition of deformity. Even in cases such as these, the preliminary and final steps of the operation may in most instances be filmed on the cadaver, thus eliminating to a great extent undue exposure of the patient to trauma. The various steps obtained by the combined material may be so arranged and interposed as to give a complete and clear presentation of the operative procedures and findings.

To make the story of the operation most effective, anatomical dissections and animated drawings are of great value in conjunction with the actual operation. A preliminary presentation of the anatomical dissections relative to the field of the operation, clarify the necessary steps of the operative procedure. The fine details of operative technique can very often be brought home more

clearly by means of animations
Undoubtedly in the course of time, the lighting
and photographic devices may be so perfected as
to eliminate many of the dangers and difficulties
above mentioned

In conclusion, I should like to emphasize a few of the important points

- (1) There is a great demand and a useful field for the development of motion pictures for teaching purposes especially in the field of anatomy, physiology and surgery
- (2) The filming of operations on the living has its dangers and should be done with a great deal of care and caution as it may subject the patient to unnecessary trauma
- (3) The filming of operations can and should in most instances, be performed on the cadaver as the photographic results are better and the difficulties are fewer
- (4) A great aid in teaching in conjunction with the motion picture films is the addition of still pictures selected from the same films which may first be presented to the class as a forerunner of what will be shown in the films. These together with an illustrated manual prepared on the subject will enable the teacher to enter into a more detailed and thorough discussion of the subject
- (5) Such teaching films are in reality visual texts and as such the author should receive due recognition in order to encourage such efforts
- (6) A cinemagraphic medical society composed of those men interested in the production of teaching films would be most useful. Their experience and knowledge along such lines could thus be interchanged to mutual advantage, thereby obviating many of the mistakes heretofore made and mapping out the best procedures for future work along such lines.

THE PROBLEMS OF ADOLESCENCE

By HERBERT J CRONNIN, M D, and ELIZABETH ANN SULLIVAN, CAMBRIDGE, MASS

DOLESCENCE is that decade of life between puberty and maturity in which the instinctive and emotional strivings are The procreational instinct which has lain dormant during childhood bursts into activity at puberty, and with the advent of puberty there is initiated the first great epoch of development Closely associated with the physical changes that occur at that time there are, also, manifested by behavior or attitude, many psychic or mental changes with resulting maladjustments which concern parents and From the manifold problems arising during adolescence the maladjustments springing from the lower strata of the child's mind and subject to successful redirection will be considered here These maladjustments arise from conflict between the instinctive strivings and the intellectual or cognitive control

An understanding of the normal but poorly adjusted child has recently been evolved from studies of abnormality which, although once considered to be definitely demarked from normality, is in fact but deeper shades of processes contained in the normal. The original endowment of the child, his early training, his environmental influences and his guidance during adolescence are now stressed as paramount for the development of a healthy mentality equipped to meet satisfactorily adult situations.

The plastic mind of early childhood is susceptible to injury and it is in an understanding and avoidance of such injuries that mental health in maturity may be expected During adolescence many problems arise which form the nuclei of future maladjustments with associated social and economic failure. From these many problems five have been chosen for discussion first, the necessity of adequate emotional control, second, unrestrained phantasy or day dreaming, third, feelings of inferiority, fourth, escape from reality, and fifth, overattachment to the parent.

TANTRUMS

The infant is guided to the satisfaction of his wants by the instinct of self-preservation. If he is hungry, cold, or in pain he cries until relieved. As the intelligence develops the child acquires an understanding of situations and thus the normal child by controlling the bursts of primary emotion waits for his food or bears slight discomfiture without crying. However, the child of intense emotional unbalance is governed entirely by these primary strivings and he soon finds that by an emotional explosion (or tantrum) he is able to

dominate his parents and to gain immediate gratification of his desires. These affective or emotional reactions which later mould the personality make-up are manifested in the young child by his mood reactions to unpleasant situations.

When affective reactions of anger are coupled with physical manifestations such as dancing, violence or destruction, we designate them as tantrums. Hence a tantrum is an uncontrolled affective explosion in which the child is guided by primitive instincts, reacts with primary affects and for the duration of the attack the higher intellectual faculties which ordinarily through logic or other cognitive qualities direct behavior, are inhibited or blocked. Tantrums, instigated by a thwarting or frustration of desires, are directed toward the parent with the intent of domination.

A child of overindulgent parents may dominate his environment by these explosions. The parent, on the other hand, desires to satisfy every passing whim of the child and thus hinders the development of intellectual control. The tantrum habit is formed because by it the child is always victorious and finds that he is the center of attention.

To illustrate, I will describe the following episodes

David is lying upon the sidewalk clutching the curb, kicking at his mother with both feet and bellowing

"I won't get up, I won't go home Get a policeman if you want I won't, I won't," screams David to the insistent pleading of his mother who looks appealingly at the growing crowd

"Please do what mother asks, dearie. That's a nice boy Give you nice candy, ice cream and cake when we get home," she urges with a rising voice, as she avoids his kicking feet, for David is a strong boy and his kicks hurt

Ten minutes pass, the crowd increases David's howling grows louder, his kicking more furious, he scratches, bites and rolls about the sidewalk

"I cannot do anything with this boy," she confidently wails to a friendly adviser who suggests a good thrashing "Oh, no! He must not be punished that way If his father were only here!"

At this point, attracted by the crowd, a policeman did appear and David leaped to his feet, dashed across the street and home while the crowd debated heatedly on the method they would use if they were given the opportunity

The following case is that of a child ac-

customed from babyhood to dominate the household and resist by tantrums and physical

violence any thwarting of his desires

Johnny Jones, a healthy youngster, had the constant and undivided attention of his father, mother and grandparents. All day long the mother and grandmother closely followed every movement that Johnny made, talked with him incessantly and played his games sprawled over the floor. Johnny must be assured of every comfort, every pleasure, and because of "his nervous temperament" should never be crossed or forced to do anything he did not wish

"I shall allow Johnny to grow up unrestrained and unhampered He must assert himself in order to develop," declared his mother to a neighbor who suggested that the child might be hurt if he continued to jump on the running board of the automobile when it was starting "Johnny is a sensitive and nervous child with a keen appreciation of values and I could not injure his budding feelings with a reprimand I am sure that if you speak to him kindly he will willingly listen to you"

Johnny certainly was developing along paths chosen by himself and whenever his desires were frustrated he threw himself into a fury of rage, screamed, bit, kicked and pounded his parents until they eagerly leaped to obey his

every wish

One of Johnny's delights was to watch the iceman chop ice, and he always ran out to watch the process "Any ice today?" Johnny heard the iceman call one day, and with the cry the boy raced to the door. His grandmother was there ahead of him and said, "No, no, my baby must not get his feet wet. Get nice rubbers for good Grannie."

With a savage howl, Johnnie pummelled Grannie with both fists, tried to tear her clothes and then butt her away with his lowered head. Finding himself unsuccessful, he dashed from the hall to the front room with its low windows, paused for a moment and then plunged through the large pane of glass.

several feet to the ground below

When he was removed from the mass of broken glass it was found that he had a large abdominal wound that required surgical treatment. Hardly was the child out of the ether when the family with fresh zeal began playing games in the bed with the child, begging him to make some request for them to grant

"Yes, we shall do anything in the world for Johnny," chorused the mother and grand-mother

And yet, when he climbed out of bed an hour after the ether the doctor was informed that while Johnny's wounds might heal better if he remained quietly in bed as had been

ordered, Johnny desired to play on the floor, and a child with such a nervous temperament must, under no circumstances, be crossed

A' tantrum, then, is an affective explosion based upon primary instinctive trends and is designed to control the environment. The tantrum habit must be broken by the parent by proper training if the cognitive or intellectual functions are to be supreme. Civilization results when the primary instincts with their affects are directed by the intellect, and if a child is to benefit socially from civilization he must be taught early to master the emotional explosions which have been described as tantrums.

PHANTASY OR DAY-DREAMING

In adolescence with its physical changes based upon glandular activity there are coexistent mental changes which encourage phantasy formation or day-dreaming. During the interim between childhood and maturity the individual lives in a state of uncertainty for which he compensates by the elaboration of phantasies, phantasies of power, wishes, hopes and aspirations for the future. The maturing child peers with apprehension into the future and finds solace by turning his thoughts inward on himself, shutting off the outside world of reality.

In maturity it is difficult to retrace one's steps through the period of adolescence because in maturity the individual has had to face reality, and has found his position in the economic world. In adolescence maturity is approaching, soon to engulf the child in its activities. Love, marriage, social position, economic status, these and many other activities appear. Happiness or misery, success or failure, an early death or a long life, all these eventualities are contained in the future. Thus with the uncertainty of the future speculation begins, reality is ignored, the wish becomes supreme and so the meshwork of phantasy is spun

The boy wishes to become a sailor, soldier, pirate, robber chief, the girl a beautiful princess. To gratify these wishes it is only necessary to open the door to phantasy

Phantasy formations are moulded by the instinctive strivings of both sexes and the drama enacted contains the buried wishes of the individual. There are many phantastic formations which recur with frequency in the race and are similar in content. One of these phantastic elaborations is that one is not the child of one's parents, that the true parents are only foster-parents, that some rich, distinguished, noble figure is the actual parent, and thence from these desires there is evolved an actual dislike of the real parent, combined with depreciation, intolerance and disrespect

In this astounding condition progressing secretly in the child's mind parents might well feel chagrined until it is appreciated by them that the ideal figure created by the child, these kings or queens, are merely phantastic presentations of the real parent

From the elaboration of phantasy have sprung myths and legends. In the birth accounts of many legendary heroes it is often noted that the hero is the son of a deity, left to be nurtured by shepherds and later recognized and claimed by his divine parents. The fairy tales with the princess in disguise, with riches and marriage to the prince concluding the story, are the products of the same phantasy elaboration and delight the youthful reader because in them is found the consummation of his own desires.

Hence in myths, legends and fairy tales with their rich symbolism is exemplified or dramatized the unreal

In the adult the exaggeration of this same phantastic process is manifest when the mentality becomes impaired. In such cases of mental impairment the phantasy develops into delusion or false idea as measured by normality. Their content is, however, the same as in the past for we find our deluded patient claiming to be an heiress, a descendant of nobility, an emperor or a divinity.

In the studies of dementia pracor, the commonest and most serious form of mental disease, a history of the early life of the patient discloses day-dreaming, seclusiveness and disinterest in reality. As dementia pracox progresses there is formed for the individual another world in which he lives, while the world of reality for him is gradually obliterated.

In the correction of abnormal day dreaming the child should be kept in contact with reality by work or play and other methods that will force him to occupy himself with the outside world

In the following case unrestrained daydreaming was carried so far that it proved disastrous both at school and in later economic life

During the greater part of every recitation hour Ruth listlessly played with her book, or sat abstractedly with her eyes fixed upon the red roses on the teacher's desk. The brisk discussion in which the other high school students entered with animation brought forth no evidence of interest from Ruth

"What is your opinion, Ruth?" suddenly queried the teacher, who had been observing the girl's distraction "You may take up the discussion at this point"

Rising automatically to her feet, Ruth fumbled, her little color vanished, her tremgling hands dropped the book as she attempted

to find the place Then she stood silent until excused

"There is no need of these failures, Ruth," said teacher that afternoon after the session ended "Until recently your standing in the class was excellent, but now you are out of contact most of the time You must keep your attention focused upon the work and stop day-dreaming"

Chagrined at the justified rebuke Ruth became resentful, rebellious and taciturn. Her family had already gently chided her for spending so much time alone in her room musing rather than taking part in the activities of the other girls. Once she had ended further discussion of her behavior at home by refusing to eat for two days and ignoring the family completely. When Ruth returned home after her interview with the teacher, she fled to her room, locked the door and considered how she might punish the teacher as she had already punished her family.

for a long period prior to this incident Ruth had alarmed her parents. Her appetite was capricious, her manners insolent. She remained indoors most of the time, avoided all social contacts, talked little and spent her time apparently in idle reverie or lonely walks. She read books far too advanced for her years, the family thought, but whenever friendly suggestions were offered, Ruth retaliated by irritation or contempt. Her parents considered that it was best to allow Ruth to develop along her chosen lines and not to thwart her desires. Hence, next morning when Ruth appeared at the breakfast table with an ultimatum concerning school, the family assented without protest.

"I have decided to leave high school, father," she began calmly "The course of studies there does not fit in with my plans for education From now on I shall remain at home and follow the line of study which I shall select"

Ruth was a bright girl and because of her training in preparatory school was able to enter college. For a time she concentrated upon her studies but soon her interest flagged, day-dreaming became rampant. Social activities disturbed her. She became seclusive, tacitum and unsocial. Her plays of phantasy absorbed her completely, her academic progress diminished and dismissal in the second year followed.

FEELINGS OF INFERIORITY

The inferiority concept was first elucidated by Adler in his well known book, "Constitutional Inferiority" Adler's theory in brief is as follows When there is some defect in the individual's physical or mental equipment feelings of inferiority are engendered. The patient in order to overcome these feelings of inadequacy often compensates by a protest. This protest reverses the mechanisms which produce the feelings of inferiority and the person then substitutes in their place a guiding fiction, an unattainable goal, for the direction of his efforts. For example, a person with a dull mentality has in the presence of educated people strong feelings of inferiority which result in shyness or reticence. However, when the reversal or protest occurs he may compensate by aggressiveness

Feelings of inferiority may be confused with the instinct of negative self-feeling described by MacDougall. In gregarious animals leadership falls upon the older members of the herd who have strong positive self-feeling. Where there are several males in a herd leadership rests with the strongest and the others must accept. This ability to accept the leadership of another is brought about through negative self-feeling which is a measure of protection for the herd, otherwise damaging combat might destroy their unity

During youth the activity of the instinct of negative self-feeling is essential if the child is to maintain the proper attitude toward teachers. However, it is easy during the period of childhood for feelings of inferiority to become established and acquire increased potency through their combination with the instinct of negative self-feeling. These feelings may be promoted by the possession of some physical or mental defect, real or imagined, that decreases the child's worth among his fellows. The undertaking of tasks too difficult with resulting failure may motivate these feelings of inferiority.

In the following case feelings of inferiority were engendered because of failure based on an

unrecognized physical defect

"When I was twelve baseball absorbed me," said Mr Brown "After school hours and on Saturday I practiced batting, pitching or catching I could throw farther and swifter than the other boys, could run the bases faster, but when it came to batting in a game I could not hit anything"

"Oh, here's Brown's turn to bat!" I would hear

my team mates moan

"However, try as I would, I could not hit the ball and when I did, I knew that it was an accident In my ignominious position as right fielder I had little work, for the center fielder never trusted me to catch a high fly It did seem strange to me that I could not judge those high flies accurately for although I was sure that the ball would fall in my hands, it would descend onto the tips of my glove and thence to the ground"

"Years after," continued Mr Brown, "I found that my baseball difficulty was due to defective vision With this defect of course I could not

follow a curved ball, nor could I accurately judge a fly In every sport where keen eyesight was a requisite, I failed, but in water sports I excelled It was through my success in those sports that my earlier feelings of inferiority were resolved."

It is apparent that the organic defect in the case of Mr Brown developed his feelings of inferiority However, a compensating spirit of success grew out of his mastery of water sports a compensation that later assisted him in solving

the intricate problems of business

We all remember when we were in the fourth or fifth grades the older children who were with us because thy had been forced to repeat grades These older children with their maeach year ture bodies and childish minds felt out of place, hated school and were a source of daily ridicule because of their duliness. Their feelings of inferiority were increased by stupid blunderings, and to compensate for these feelings of madequacy, many of them became disturbers or trouble-makers If we examined them we should probably find an intelligence quotient of from 60 to 75 However, with the low school age these children in the past went to work and found satisfaction at their level Hence, in the prevention of feelings of inferiority in the subnormal it is essential that academic progress should not be insisted upon beyond the mental endowment of the child, and that a successful adjustment in some line of physical endeavor be promoted

The child of normal intellect, with feelings of inferiority caused by some physical defect or imagined mental inadequacy, for there are many who undervaluate their abilities, needs encouragement in the development of self-assertion. Feelings of inferiority in the intellectual field may arise in the normal as well as in the subnormal. The mentally surnormal child is unable to cope in school with the brighter children, and great unhappiness may result from the development of feelings of inferiority. This occurs in particular when mental defect is not recognized in a child and the child is consequently harassed, punished

or caricatured because of poor rating

By the use of the standard psychometric tests a child's mentality may be measured and the possibilities for school progress estimated. By these tests the mental age of the child is arrived at. To go to high school a child needs an intelligence quotient of 100, to go to college 130. If a child has an IQ of 75, then according to the Fernald predictions the sixth grade is the limit of academic progress and if further school advance is desired then it must be in the field of vocational training. Hence it is apparent that every child has a definite mental endowment with limitations for academic or intellectual effort which cannot be passed.

ESCAPE FROM REALITY

The desire to escape unpleasant reality is accomplished by the formation of a defense attitude

called "the escape mechanism" and these escape mechanisms, of physical or mental character, are shown by a large number of children at adolescence. In the physical sphere, for example, the feigning of illness, nausea, vomiting or fainting attacks may be motivated by a child's desire to avoid examinations at school or to win the sympathy of an exacting teacher. By these simulations there results a focus of attention by the parent or teacher upon the eventualities of the illness and a mitigation of demands on the child. Thus through the escape mechanism the child is able to avoid some disagreeable situation and become the center of solicitous regard.

When the difficulties arising from some degree of mental madequacy motivate the child's desire for escape, the goal may be achieved by the simulation of physical disease or the development of behavior problems The defective child, sensing his mental limitations, must compensate for his feeling of inferiority by the production of defense mechanisms and then choose the method best adapted to help him to escape from unpleasant Discontinuance of school for defective children is the natural escape, and desirable when other training is substituted. However, a certain proportion of dull children through the stimulation given by parents and the low standards of some schools continue as students in order to escape the reality of economic and parental independence

Unsatisfactory school progress is caused by some physical or mental disorder. The physical disorders are easily eliminated and mental defect may be determined by the standard tests. Other mental disorders characterized by fears, inferiorities, resistances and the like may be resolved by psychiatric methods.

The training of dull children should be definite and along lines suited to their abilities or disabilities, because desultory academic training is disastrous to the poorly endowed child as it delays the day when he must make his adjustment to reality Parents who oppose the idea that the child may be limited academically because of inferior mental endowment readily recognize the limitations of inferior physical endowment Thus it is that many parents encourage a child with poor mental equipment to undertake too great mental tasks The following case, that of Andrew, a boy with an intelligence quotient of 85, who was encouraged by his parents to go to college, will illustrate some of the following points, the escape from reality and phantasy formation in a boy with dull mentality, the parents' refusal to recognize the boy's limitations and their neglect to train him in manual work, the boy's refusal to accept reality by striving for high position without corresponding effort, and his continuance of the adolescent state with its parental dependence and freedom from the economic problems of maturity

At the age of thirty Andrew was still a student at a local university where he was taking special courses to enter the freshman class without conditions. For twelve years Andrew had been a special student at several colleges, a state normal school and two medical schools without ever attaining a regular standing

Andrew lived at home with his adoring mother who saved just enough from her husband's small salary to finance her son these many years in his college activities. There were few such loyal college boys as Andrew even though he was only a two course special. Flowing banners of the college were tacked upon the walls of his room, massive piles of unopened books lay upon his table for he always bought the required equipment and more.

Sprawled in an arm chair sat Andrew, dressed in his natty tailored suit, a cigarette in the yellow stained fingers of his left hand and a pack of playing cards in the yellow stained fingers of his right. Across the table sat a freshman, twelve years Andrew's junior who was glad to accept the attentions of the older student for to the inexperienced eyes of the boy, Andrew was a man of the world and any recognition from him was to be encouraged

"No study for me tonight Let us go to the movies or a dance I have the money," said Andrew as he took from his pocket a five dollar bill which his mother had given him that day to buy another new book "The instructor in English is a real dub. Why, you know he wrote on my composition today that I should study spelling and punctuation. I have forgotten more English than that prig ever knew. As soon as I get my points at this little college I shall enter a real school, become a doctor, buy a big car and then what a life! Lots of money, a swell house and everything"

It was eleven thirty the next morning when Andrew finally opened his leadened eyes, and yawning wearily he slowly dressed

"I can cut these courses easily," he announced to his mother as she prepared his breakfast. I know that stuff better than the instructor I guess I shall go to the ball game this afternoon I don't have to study until the mid-year exams"

When the mid-year marks were posted Andrew received a note from the dean informing him that because of his low grades he was dismissed from the school

"Just read this note," Andrew bellowed to his parents that evening "I told you that the instructors in that school were against me and that the school is in the control of a group that tries to keep poor boys from receiving an education I'll become a doctor or burst"

His mother was momentarily crestfallen as she had only just finished telling her husband of the attractive future ahead for their son as a prominent physician "If these schools are in the hands of a despotic group," she said, "they should be exposed. They cannot stop me from giving him what he wants. Tomorrow will bring me another plan. My heart aches when I think of the odds that boy has had to face since he was in the eighth grade."

Fifteen years earlier when Andrew had been threatened with demotion in the eighth grade his mother's denunciations of the teacher's lack of sympathy and unfairness were increased to vehemence when the teacher suggested that the boy enter a vocational school as the teacher questioned the boy's ability to make further academic prog-His mother then entered him in private school after private school with the constant repetition of an enthusiastic start, indolence, lethargy and finally dismissal With each new school, its recreational activities, its campus life. Andrew's ambition became more buoyant His roommates were all familiar with his glowing hopes which he unfolded to any listener while puffing out clouds of cigarette smoke Fortune, fame, and social position were never far distant

In spite of his mother's hope that the morrow would bring another plan many days were required to find a solution for Andrew's latest school difficulty Turning the pages of a magazine her eyes danced with joy Here it was "Learn medicine by mail Become a doctor at home Join our correspondence course" Andrew was not to be thwarted He was again a college student A new banner was hung on the wall, a new lot of books were purchased Flecking his ashes with his yellow stained fingers, he murmured, "I'll get there yet This is the best of all No teachers this time to bore me"

FIXATION

The emotional over-attachment of the child to the parent if continued into maturity results in the state designated as "fixation". This state, contrasted to those emotional disturbances considered under temper tantrums and motivated by the instinct of self-preservation, is dependent upon the unconscious activation of many instincts. Jung vigorously condemns promotion of such emotional attachments between parent and child, because the child is fixed to the parent so strongly that he is unable in maturity to adjust to adult situations. Unless resolved, the continued overattachment emotionally cripples the individual and is an obstacle to family growth.

Historically, fixation of the child to the parent was understood centuries ago by the Greeks and the Romans They encouraged the early separation of the boy from the parent, his attendance at gymnasium, and the development of independence and self-reliance. With the decadence of Greece the rigorous discipline of youth was discarded and there was a return to parental dependence with its resulting effeminacy and a stunting of emotional development Throughout history we

recognize that there is national strength where there is appreciation of the value of freedom from fixations. While fixation in the child is motivated by instinctive strivings there are many psychic forces working in the parent such as self-love or self-indulgence which may be assumed in this discussion.

Nature planned that, in the developmental stages of child growth, there should be a gradual separation of the emotional attachments binding child to parent. It is only in the human species that parent fixation or what is technically termed the oedipus complex arises, an emotional crippling for which the unwise parent is responsible and for which the child is the unfortunate recep-In the animal world there is no oedipus complex and one wonders at the forces of nature operating instinctively in a wire-haired fox terrier who had several litters of puppies and whose behavior towards them never varied. Jealously guarding them, fiercely protecting them, and carefully nurturing them during their early weeks of dependence, her attitude gradually changed as they grew older She would then no longer play with them, growled disapprovingly at their continued presence, snapped at their heels to disperse them, and was not happy until they all had left her to continue of their own accord nature's

The following case illustrates the stages in the formation of a fixation. There is an over-attachment to the mother, correlated with an antagonism to the father, identification of all authority to the father, and therefore resistance to all authority.

Seven-year-old Gerald Smith was finishing breakfast as the nearby school bell sounded its warning strokes. His mother was hastily dressing to accompany him to school, for as usual, after she had washed, dressed, carefully combed Gerald's smooth black hair, found the particular cereal that might please his capricious appetite that morning, and had urged him to eat a big breakfast to please her, there was little time remaining to prepare her own toilet.

"My little boy must hurry or he will be late," his mother gently admonished as she pulled on his overshoes

"You do not feel well? There is a sore place on your lip? You may stay home if you wish, my dear You think that you will be able to remain for half the session? Now, aren't you the brave boy! Mother will kiss away all the pain," replied Mrs Smith as she fondled Gerald in her arms, stroked his smooth hair and smothered him with kisses

On their arrival late at the school there was another exchange of caresses combined with a short instruction to avoid the rough, boisterous boys of the school, not to enter their games and to keep himself clean

"Those rough boys have no manners, my dear," repeated Mrs Smith "Mother wants all her

little boy's love and if he became interested in the things those rough boys do, her sweet child might forget her"

When Gerald was twelve Mr Smith decided to send the boy to boarding school ten miles from

home

"I think that Gerald needs boys to play with and should take part in boys' games," he replied to his wife's objections "He is too much about the house and although you say that the cakes he makes are excellent, I should rather have him play on the boys' baseball team"

Gerald's departure to the boarding school was finally accomplished with a flood of tears, prolonged caresses and last minute admonitions

"I don't like this school, mother," telephoned Gerald the next day "They have rules for everything and I won't obey them The other boys are rough, mother, and they plague me They call me 'sissie' and ask me if I am tied to my mother's apron strings"

"What a shame, my perfect dear," weepingly replied his mother "Of course, come home im-

mediately"

Mr Smith did not approve entirely of this sudden return, but it was finally agreed by Mrs Smith that Gerald should live at home and attend the day session of the same boarding school

"Yes, I admit that Gerald's conduct is exemplary," replied the school principal to Mrs Smith's question "However, he is failing in several subjects and I shall have to demote him Do you know that he does not mix well with the boys of his age? They are all manly little fellows,—good stuff in them all, but Gerald confided to me that he thought them rough and unmannerly"

Peeking through a window a few days later, Gerald observed some school mates surreptitiously playing cards, "High, low, jack and the game" Of course card playing was strictly against the school rules, so Gerald promptly reported and with delight heard the reprimands administered to the culprits. However, the informer was soon known to the boys and that evening Gerald was soundly trounced by a group after dark. Next

day he was removed by his infuriated mother from that school amid heated denunciations directed toward the faculty

Mr Smith, perturbed at this unexpected event, insisted that Gerald must develop as other boys do and sent him to a camp

Gerald viewed the camp with suspicion, disapproved of the rough dining hall and shivered at the idea of sleeping in a tent. He shyly watched the exultant groups of boys plunge into the ocean, dive off the raft, or leap from the boats

"Don't leave me here alone," he moaned to his mother, who quickly promised to remain for a week at a nearby hotel

When taps sounded "lights out" a camp councillor heard Gerald weeping bitterly

"I won't stay here, I am unhappy, lonely and

you can't keep me here"

And true it was, for on the early morning train back to the city sat Mrs Smith patting Gerald's smooth black hair and drying his wet cheeks

The results of the parent fixation on maturity could be extensively elaborated by discussion of the mechanisms of identification, parent image and the disturbances of the instinct of procreation with resulting neuroses. Freud asserts that the oedipus complex or parent fixation in the nuclear complex of all neuroses.

In reference to the desirability of facing reality and understanding human motives, the following is quoted from "The Meditations" of Marcus Aurelius

"The healthy eye should see all that meets the sight, and not say 'I want things green,'—the confession of weak eyes. Healthy hearing and healthy smell should be prepared for every sound and every scent, and the healthy stomach too for all kinds of food, no less than the molar for everything which it was made to grind. So too the healthy understanding should be prepared for all that befalls. The mind that cries 'Save my little ones' or 'Let everyone applaud each thing I do' is the eye that wants things green, or the tooth that wants them soft."

ERECT PERCUSSION PAIN METHOD OF ABDOMINAL DIAGNOSIS By L WINFIELD KOHN, MD, NEW YORK, N Y

T HE abdominal wall is a muscular and aponeurotic structure supplied by nerves which are in physiological relation to the different organs underneath, through the medium of the vegetative nervous system. The lower intercostals especially are concerned in abdominal expression of cutaneous hyperesthesia, muscle rigidity and referred abdominal pain. These nerves are intimately connected with the sympathetic system which supplies the abdominal viscera.

In acute abdominal conditions, cutaneous hyperesthesia and muscle rigidity are often the chief abdominal features but in the chronic or subacute conditions this is not usually the case and an effort is made to elicit tenderness through palpation or pressure. A study of palpatory tenderness proves valuable in many instances

In this article the subject of percussion is the special method of diagnosis under consideration, not, however, in the sense of its ordinary employment in the past but rather as a means of eliciting abdominal tenderness which in turn is to be interpreted in relation to the disordered condition within the abdominal viscera

Franz Ehrlich*, in 1923, in a paper entitled "Ueber die diagnostische Bedeutung des Faustschen Klopfschmerzes im Stehen am Abdomen." attracted the writer's attention to the possibilities that may be derived from an examination of the abdomen of patients in the upright position From the results of the study of the abdomen by the simple percussion method, much valuable data has gradually been accumulated, leading to the conviction that the percussion method of studying abdominal sensitiveness has, at times, certain advantages over the pressure method percussion is done only while the patient is in the erect position

Normally, stimuli from the visceral organs are not of sufficient intensity to cause the perceptive centers in the brain to take notice of them, hence no pain is appreciated. When, however, stimuli from a visceral organ are sufficiently intensified above the normal to cause the brain centers to perceive them, a disordered sensation is experienced—usually pain. This disordered sensation will, as a rule, manifest itself in that portion of the body which corresponds to the centers in the spinal cord affected by the abnormal stimulus. It

will follow to a great extent the segmental relationship determined during embryological development

Pottenger states that "as a matter of differential diagnosis between organic and functional disturbances, it may be broadly stated that a motor secretory disturbance in any important organ belonging to the enteral system, unless accompanied by sensory, motor or trophic reflexes in the skeletal structures, is not due to inflammatory organic change in the tissues of that organ." The author despite this assertion believes that certain functional states as pylorospasm, gastrospasm and bile duct spasm may be sufficiently stimulating to render the nerve cells and fibres of the sympathetic system irritable, in consequence of which a painful sensation is conveyed to those tissues supplied by the spinal nerves which mediate with the sympathetic elements the other hand, he also believes that there are instances when organic disease does not furnish the stimulus necessary for a production of pain within the body wall, this being the result of a lack of intensity in irritability of the diseased process or possibly because of a conditioning or modification of the reflex through gradual adaptation of the nerve centers to the stimuli furnished by the diseased process

It is to detect such concealed lesions and to elicit abdominosegmental tenderness where many other methods fail, that resort is made to the use of the percussion pain sign normally sensitive segments are a rather important key in the solution of abdominovisceral Disease of any of the upper digestive organs may produce segmental irritability in any of the areas governed by centers within the spinal thoracic segments — fifth to the This is plainly manifest in the acute conditions but in the chronic diseases, these clinical manifestations are not pronounced and it is in such instances that strong percussion in the erect position will through its suddenness and sharpness of impact, send a stimulus to the spinal centers which will bring out the tenderness that signifies the existence of an irritable or sensitive abdominal segment tenderness usually implies an organic affection

The patient being percussed in the erect position, is unable to protect the tender area through the medium of abdominal muscular contraction, and the transmission of an impulse to a diseased focus by percussion is far more satisfactory when the patient stands erect than when he is lying down Especially is this true of the upper abdomen. In the erect position, the organs of the upper abdomen uncover themselves to a certain extent. This is especially true in the atonic abdomens. Valuable information may be gleaned from the degree and extent of the sensitiveness of a segment and it is from this angle that intelli-

Deutsche med Wochenschr 749 149 Feb 2, 1923

gent conclusions should be formulated. In a subsequent paper, the writer expects to present his findings in a large group of cases and to co-ordinate them with other symptoms and the diagnosis

In conclusion, it must be emphasized that this method of diagnosis finds its particular field of application in ascertaining the existence of a tender abdominal organ whose impressions are transmitted to a certain segment This being established, its relation to other signs and symptoms that may manifest themselves must be based on personal experience with this Erect Percussion Pain Method. The writer is led to believe that it indicates the existence of an organic affection in nearly all cases. It may especially prove of value in detecting early ulcus.

EXAMINATION OF THE CONTENTS OF THE ABDOMEN BY AUSCULATORY PERCUSSION

By ELIZA M MOSHUR, MD, BROOKLYN, NY

THE writer is surprised to discover that so few physicians accustom themselves to the use of auscultatory percussion of the abdomen in their efforts to discover the condition of its contents

Twenty years of routine examination of the abdomen—the really most important laboratory of the human body—have proved the value of this method in the practice of the writer

Preliminary to such an examination it is important to ascertain the distance between the tip of the ensiform cartilage and the upper border of the pubis, since a short sternum—5½ to 6 inches—indicates a long abdominal wall 12 to 15 inches

It is a well known fact that the greater the distance between two points of support the weaker at its middle will be the part supported

This rule holds good here Ptosis of the transverse colon is seldom found except in persons having an abdominal wall of exaggerated length

Next to this measurement in importance is the location of the attachment of the splenic colon to the side wall of the body easily be found by placing the stethoscope in this region and tapping lightly off and on the colon from the navel to its attachment which normally is found about midway between the lower border of the ribs and the crest of the When attached higher the stethoscope oulines a sharp angle where it turns down-In these cases the splenic colon will nearly always be found to be wider than normal due to repeated distension by the damming back of its contents Such patients complain of pain which they locate in the heart or lungs, both of which, however, are usually found to be normal

After locating the colon it is easy to outline the stomach by the same method. When not empty, under gentle pressure of the hand the gurgle of its contents can easily be heard as they pass the pylorus

The gall bladder, if distended, can be outlined by this method also. It is well to administer a Seidlitz powder when after free movement of the bowel its contour will be lost if its outlet is not obstructed and it contains no stones.

The ileum in the ileo-cæcal region can also be outlined by auscultatory percussion, especially if from any cause it is overdistended. It is important to locate the caecum, as in some individuals its loose or high attachment to the side wall of the body permits it to swing almost to the median line. In such cases the ileo-cæcal opening is so displaced that damming back of the contents of the canal is very marked and displacement of the cæcum has, in some cases, seemed to favor the occurrence of acute appendicitis. Wherever continued, or off-repeated overdistension occurs in any part of the canal, more or less pain is felt and tenderness to manual pressure is present.

The descending colon is more or less permanently dilated by continued constipation and the frequent use of high enemata. If fecal matter, or even water, fills the sigmoid flexure, and remains there unduly, not only overdistention occurs, but a lengthening downward of the loop which becomes a permanent obstacle to the normal onward movement of the contents of the canal. This elongated flexure, or kink, can be outlined by stethoscope, though with some difficulty

Marked delay in the normal movement of the intestinal contents permits the bacteria always present to multiply Absorption of their contents frequently results in lowered general health

In making a general diagnosis it is most important to outline the location and condition of the abdominal viscera. This requires but a few moments of time and should never be omitted.

RECORDED CAUSES IN FIVE HUNDRED STILLBIRTHS IN NEW YORK CITY* By LAURA W NATHAN and GODIAS I DROLET.* NEW YORK N Y

INCIDENT to the collection of data referring to stillbirths occurring to residents of its District only the Bellevie-Yorkville Health Demonstration in New York City also noted the record of the causes of death as listed on the certificates for all the stillbirths reported in hospitals or homes in the District regardless of residence of the mothers. The material covers some 500 cases of stillbirths in a district which includes in its boundaries some of the largest hospitals rendering obstetrical services in New York City

The stillbirth certificate records the immediate cause of death and also predisposing causes. For this study only the immediate cause, as reported by the attendant in each case, was utilized

The causes as presented by the attendants have been listed and classified as is usually done in the Birth Registration Reports of the U S Bureau of the Census While this study does not attempt to do more at present, it still seems worth while so that other possible and broader phases may be developed, even from the data on the certificate alone period of gestation, influence of sex, color, race of mother, predisposing causes, with division into antenatal, intranatal, and postnatal stillbirths

A stillbirth as defined by the Bureau of Records, New York City Department of Health, covers any non-viable product of conception de-

livered at any time during gestation

Following is a list of the causes of the stillbirths in the Bellevue-Yorkville District with numbers and percentages of the total, classified as in the reports of the Birth Registration Area of the U S Census Bureau—with a few changes and additions to fit the particular material on hand

A study of the 498 cases of stillbirths shows that 56 occurred at home and 442 in institutions, details of which are also shown in Table II It must, of course, be remembered that often hospital cases, especially at Bellevue Hospital, the municipal institution in this District, are emergency cases that have not been under the care of prenatal clinics

A comparison of the relative frequency of various causes of stillbirths recorded in hospital or institutional cases and at-home cases shows that there is practically an equal proportion of asphyxia of the child, difficult labor, and death in utero

On the other hand, abortion, miscarriage, and premature births are more than twice as frequent among hospital cases as among home cases Dis-

eases of the placenta and membranes are also considerably greater Prolapse and compression of cord are slightly higher as are also toxemia and nephritis

All stillbirths due to diseases of the child occurred among hospital cases. The same group includes all stillbirths due to hemorrhages, rupture of the uterus, hydramnios, therapeutic induction of labor, inertia of uterus, and extra-uterine

pregnancy

Malformations and syphilis in this series of stillbirths are greater among the at-home cases. Injury to child with but two cases is still twice as great among at-home cases. Other diseases or conditions of mother, such as influenza and high blood pressure, are considerably more frequent among the at-home patients, while traumatism and overwork are also greater. Causes not specified and unknown are naturally higher among the at-home cases than those under institutional care.

The causes due to conditions of the mother cover 202 stillbirths, those due to conditions in, or injuries to the child, number 188 and those due to either or both are 108. They are grouped accordingly in Table III.

known	30 2	19 5

It would seem in both series that the frequency of stillbirths being due to diseases of placenta and membranes, syphilis, and possibly malformations occur at a fairly equal rate. On the other hand, the greater percentage of un known causes in the Bureau of Census study—namely, 30 percent as against 20 percent in Bellevue-Yorkville, raises serious doubts as to how correctly comparisons of the two can be made Further, the possibility that in New York City an earlier reporting of stillbirths is made, would also tend to bring out different causes in each series

While it seems impractical at present from the limited facts at hand to uncover the generally common causes of stillbirths, it is still felt that a careful recording of all the information available should ultimately permit the throwing of additional light on this little recognized serious condition, and assure in some degree a more adequate registration of stillbirths

TREATMENT OF THE TOXEMIAS OF PREGNANCY*

By H J STANDER, M D, BALTIMORE, MD

(From the Department of Obstetrics, John Hopkins University & Hospital)

BEFORE attempting to discuss the treatment of the toxemias of pregnancy it is well to have before us a workable classification of these complications of the gravid state By studying and correlating the findings in a large series of patients we have been able to arrive at a rather simple and definite classification and this was only possible by observing repeated pregnancies in the same individual. This grouping, which is now in force in the Johns Hopkins Hospital, is as follows

- 1 Eclampsia
- 2 Pre-eclampsia
- 3 Chronic nephritis
- 4 Eclampsia superimposed on chronic nephritis
- 5 Low reserve kidney

Eclampsia This is a definite entity associated with one or more convulsions, usually a very high blood pressure, a large amount of albumin in the urine and certain changes in the blood constituents. The outstanding chemical findings in the blood of eclamptic patients are a high uric acid, and increased lactic acid, a decrease in the CO₂ combining power, which is very pronounced in

* Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls N Y May 10 1927 certain cases, and a tendency towards hyperglycemia From work at present in progress in our clinic it appears that eclampsia may also be associated with changes in the higher proteinsplit products, but these we are not as yet in a position to discuss. In addition to those chemical changes noted in the blood, there are the pathological changes observed in the eclamptic liver. The eclamptic group constitutes a definite entity and further discussion as to its classification hardly seems necessary

Pre-eclampsia There is a small group of patients, about 5 per cent of all toxemias, who present a picture almost identical with eclampsia, but who have no convulsions or coma eclampsia is the stage preceding the outbreak of convulsions or eclampsia I believe that preeclampsia is an early manifestation of eclampsia and differs from it only in so far as that it has not yet reached the convulsive stage eclampsia, then, we also encounter a great amount of albumin in the urine and a high blood pressure level In both eclampsia and pre-eclampsia there is a complete disappearance of the abnormal find ings within two or three weeks following delivery or successful treatment I wish you to bear in mind, however, that eclampsia and pre-eclampsia are not always accompanied by a large amount of albumin in the urine and a very high blood pressure, although the cases with a small amount of albumin and a slightly elevated blood pressure are decidedly the exception

Chronic Nephritis It is exceedingly iniportant that one be able to diagnose and evaluate this complication of pregnancy in order that the proper treatment may be instituted. If accurate information regarding previous pregnancies is available, one notes that the last pregnancy showed more renal involvement than the one preceding it, in that a rising blood pressure and the presence of albumin in the urine are observed far earlier than in the previous pregnancy There is often nitrogenous retention in the blood as well as a disturbed nitrogen partition in the urine, as is evidenced by an increased ammonia nitrogen and a change in the amount of urea nitrogen Perhaps the most outstanding characteristic of this group is the fact that at the end of the puerperium the blood pressure, and especially the diastolic, has not returned to its normal level, and the albumin in the urine has not disappeared The chronic nephritis may have developed from such causes as scarlet fever, tonsillitis, myocarditis or infectious diseases, or repeated pregnancies may have played a role in its development In the diagnosis, therefore, of this condition the patient's past medical and obstetrical history is of great importance

Eclampsia Superimposed on Chronic Nephritis It appears to me quite feasible to have typical eclampsia in a woman who is already suffering from a chronic nephritis. This does not mean that nephritis predisposes to eclampsia, for the incidence of eclampsia in nephritic women is about the same as in women without any sign of chronic From the clinical, pathological and nephritis chemical findings up to date, I am inclined to believe that changes in the kidneys are not associated with the etiology of eclampsia Eclampsia does not usually damage the kidney, but in a small percentage of cases, the eclamptic condition is superimposed on a chronic nephritis In this group the outstanding characteristics at the time of the attack are those of eclampsia, but as the patient improves during the puerperium we note more and more the signs of the underlying chronic nephritis

Low Reserve Kidney In a certain number of patients we observe an elevated blood pressure of about 150/90, which at the end of the puerperium drops to a normal level Associated with this elevated blood pressure there is a small amount of albumin in the urine, which also disappears as the end of the puerperium approaches. In subsequent pregnancies the patient is as well as, or better than, in the preceding pregnancy. The kidneys have not been damaged, there is no progressive process and there is no sign of

chronic nephritis It seems that the kidney reserve is too low to meet the extra demands of the last stages of pregnancy, as is shown by the passage of a certain amount of albumin through the glomerular epithelium and by the moderate elevation of blood pressure.

DIFFERENTIAL DIAGNOSIS

Before intelligent treatment can be instituted in a patient suffering from a toxemia of the latter half of pregnancy, it is necessary that we know the type of toxemia, and, therefore, be able to differentiate between the following groups

- 1 Eclampsia
- 2 Pre-eclampsia
- 3 Chronic nephritis
- 4 Low reserve kidney

The eclamptic and pre-eclamptic conditions are readily diagnosed. In the former we have one or more convulsions, usually a high blood pressure, appearing often quite suddenly, and as a rule a large amount of albumin in the urine, while blood analysis reveals an increase in uric and lactic acids, a tendency towards a hyperglycemia and a low CO2 combining power Ophthalmoscopic examination may show detachment or edema of the retina These findings, as well as the edema of the face, extremities and other parts of the body, disappear completely during the puerperium. You are well acquainted with the manifestations of this dreaded disease In pre-eclampsia, on the other hand, there are no convulsions but the other features of the disease are almost identical with those described as characteristic of eclampsia. We may perhaps regard pre-eclampsia as the condition immediately preceding the convulsive stage of the eclamptic en-

In chronic nephritis the patient's past history is of utmost importance. Each subsequent pregnancy is associated with an increasing degree of renal damage Chronic nephritis is to be differentiated from low reserve kidney in that, in the former condition two or three weeks after delivery, the blood pressure still remains above the normal level, the urine is not albumin free, an examination of the eye-grounds may show an albuminuric retinitis or arteriosclerosis, and there may be definite evidence of nitrogenous retention in the blood. While in the low reserve kidney there is only a moderate rise of blood pressure and a relatively small amount of albumin in the urine, and these abnormal findings disappear completely during puerperium this latter condition there are no signs of a disturbed blood chemistry, and occasionally only do we encounter slight edema of the extremities This is not a progressive process, and in subsequent pregnancies the condition is not worse, but remains the same or even becomes better

TREATMENT OF ECLAMPSIA

I shall not here attempt to discuss all the different treatments for eclampsia, but will submit for your consideration my own views on the subject. By visiting the leading obstetrical clinics in Europe, and some in this country, it has been possible to come to certain conclusions which are perhaps not in accord with the deductions one is inclined to make from results as reported in the current literature. I shall consider the treatment of eclampsia under the following headings

- (a) Anesthesia
- (b) Venesection
- (c) Elimination
- (d) Magnesium Sulphate
- (e) Morphia and Chloral
- (f) Insulin and Glucose
- (g) Routine treatment

Anesthesia Recent studies in our clinic on the effect of anesthesia on the chemical constitution of the blood and on the histology of various organs, and the liver in particular, have led to the conclusion that in the treatment of eclampsia general anesthesia should not be used found that ether, chloroform, nitrous oxide, and ethylene produce changes in the blood constituents very similar to those seen in eclampsia, and that they also bring about marked liver lesions as well as changes in the kidney I believe that the reduction in maternal mortality in eclampsia, incident to the change from radical to conservative treatment, is in great part due to the fact that a smaller number of patients receive general anesthesia It is especially interesting to note that nitrous oxide and even ethylene produce a marked disturbance in the blood chemistry as well as pathological changes in the liver sequently, the use of these general anesthetics, ether, chloroform, nitrous oxide and ethylene, in the treatment of eclampsia is certainly open to objection

Venesection I have maintained that the high blood pressure in eclampsia may be a protective mechanism, essential to elimination and have doubted the wisdom of suddenly reducing it One so often observes after a venesection a re markably sudden return of the pressure to its original high level. From a study of the results obtained with and without venesection, it appears that it is very doubtful whether bleeding, as a step in the treatment of eclampsia, is of any benefit, and it may sometimes even do harm. It also seems to me that a venesection to be of any material value in the elimination of "toxins" must be to the extent of about 1000 c c

Elimination We no longer employ drastic methods to bring about sweating and profuse elimination I have been unable to discover any good obtained from lavage or colonic irrigation,

and hold that these procedures constitute an unnecessary irritation to the central nervous system. The forcing of fluids by mouth in certain cases seems to be the only justifiable means of of stimulating elimination, and then only when the patient is not comatose.

Magnesium Sulphate During the past two years certain clinics have used magnesium sulphate to treat the convulsions of eclampsia, and some excellent results have been reported have had no clinical experience with this particular therapy, and am, therefore, not in a position to express an opinion concerning its merits. We have done a small amount of experimental work on dogs with this substance but our findings are as yet too scanty to allow of a conclusive opinion From personal communications I gather that magnesium sulphate is routinely employed in the treatment of eclampsia in a few clinics in this country, and I hope that some one will soon pub lish the results of this treatment on a large enough series of cases to allow us to form some opinion

Morphia and Chloral Experimental work on dogs, carried out in this clinic, showed that morphia definitely raised the CO₂ combining power I have already pointed out that in eclampsia we have a lowering of the CO₂ combining power of the blood, and sometimes to a marked acidosis level For many years morphia has been used by some in the treatment of eclampsia, and here is direct evidence that it may be of help in combating, in part at least, the acidosis so often encountered in eclampsia

Both morphia and chloral hydrate have a sedative effect on the central nervous system. From work on the cation ratios, I have maintained that a change in permeability of the capillary wall may result in an alteration in the nervous irritability in eclampsia. Furthermore, from clinical observations, one would assume that the nervous irritability in eclampsia is increased. That morphia and chloral, by virtue of their sedative action, may have a further beneficial effect on the eclamptic patient seems, therefore, quite plausible.

Insulm and Glucose There are two factors in eclampsia of importance in the consideration of insulin and glucose therapy. These are the marked acidosis, so frequently seen, and the liver damage in eclampsia. I feel convinced that the dangerously low CO₂ combining power of the blood, observed in a large percentage of eclamptic patients, may be overcome by the proper use of insulin with a protective dose of glucose Furthermore, it has been fairly well proven that glucose therepy may be of value where the supply of glycogen in the liver is depleted, following certain types of liver damage.

Routine Treatment I shall now outline the treatment of eclampsia as carried out in our clinic.

- 1 (a) Patient to be placed in a quiet darkened room and to be disturbed as little as possible
 - (b) To have a special nurse continuously until definitely out of coma
 - (c) To be catheterized, and examined medically and obstetrically
 - (d) To be placed on one side, with foot of bed elevated so long as coma persists Mucous to be swabbed from pharynx as it collects
 - (e) To have water freely when conscious If patient cannot drink on account of coma, or lack of desire, the intravenous administration of 500 c c of 5 per cent glucose solution should be considered
- 2 Morphia and chloral to be administered as follows
 - (a) Upon admission
 Gr ¼ morphia hypodermically
 - (b) One hour after admission

 If comatose give 2 grams chloral hydrate in 100 cc of normal salt solution, and the same quantity of milk per rectum. If conscious the chloral can be administered by mouth in 100 cc of milk
 - (c) Three hours after admission
 Gr 1/4 morphia hypodermically
 - (d) Seven hours after admission 2 grams chloral hydrate as above
 - (e) Thirteen hours after admission 1 5 grams chloral hydrate as above.
 - (f) Twenty-one hours after admission 15 grams chloral hydrate as above
- 3 No general anesthetic, such as ether, chloroform, nitrous oxide or ethylene is to be used
- 4 Should the carbon dioxide combining power of the blood be 30 volumes per cent or lower, 15 to 30 units of insulin with a protective dose of glucose, of 2 grams per unit of insulin, are to be administered. I may say here that where one is unable to have an immediate analysis of the patient's blood, a persistent coma or semiconscious state, following a fit, warrants the use of insulin with glucose in order to combat the acidosis
- 5 The question as to whether or not the pregnancy should be interrupted is one of the utmost importance. In the mild cases delivery is not attempted until after the cervix is fully dilated, then by the simplest operative means, unless spontaneous delivery seems imminent. In the severe cases of eclampsia, not responding to the above treatment, it may

be advisable to institute prompt delivery under spinal or local anesthesia. The rule that no general anesthetic is to be used, is particularly applicable to these severe cases

In intercurrent eclampsia, where our modification of Stroganoff's conservative treatment has improved the patient's condition, it is well to bear in mind that, although termination of pregnancy is not always essential to the cure of the disease, with the first sign of a relapse or of a return of the syndrome, delivery, as indicated above, should be considered

TREATMENT OF PRE-ECLAMPSIA

In pre-eclampsia the outbreak of convulsions or coma is imminent and thus our treatment must aim at preventing this disease from developing into frank eclampsia. In most cases of pre-eclampsia the procedure of choice is the earliest termination of pregnancy consistent with the safety of the patient. It is often advisable that the woman be first given the modified Stroganoff treatment and should prompt improvement follow this therapy, it may be wise to wait and allow her to enter a natural labor, watching However, carefully all signs and symptoms should the morphia and chloral treatment not result in a rapid recovery, it is urgent that delivery be effected, and if the cervix is soft or partially dilated this can be attained by inserting a bag without the use of a general anesthetic, on the other hand should the cervix be rigid, cesarean section, under spinal or local anesthesia, becomes the procedure of choice

TREATMENT OF CHRONIC NEPHRITIS

After an underlying chronic nephritis has been definitely diagnosed, one assumes a grave responsibility by allowing the pregnancy to proceed If the nephritic condition is severe, immediate termination of pregnancy becomes imperative. In the milder types of chronic nephritis, rest in bed and dietetic treatment occasionally enable us to carry the patient to term without any serious harm to the mother, but it is well to remember that such an outcome is the exception rather than the rule Furthermore, how can we be sure that the underlying renal condition has not been aggravated by the strain of the latter months of pregnancy, and that the patient's life has thereby been shortened, although this increased damage to the kidneys may not be apparent at the time of delivery? strongly advocate the termination of pregnancy in all cases of an underlying chronic nephritis, unless marked and rapid improvement follows the conservative treatment of rest in bed with restricted low-protein (and in some instances salt-The patient's free) diet and plenty of fluids past history, both medical and obstetrical, the duration of the present pregnancy and the subjective and objective findings, enable us to form an opinion as to the severity of the nephritic condition

TREATMENT OF LOW-RESERVE KIDNEY

The low-reserve kidney sustains no permanent damage from pregnancy, and is, therefore, no indication for termination of pregnancy Our procedure is to keep the patient in bed, force fluids and give her a restricted low-protein diet ally improvement is prompt and the patient goes to term and through labor without any untoward signs or symptoms, and she is discharged with a normal blood pressure and an albumin-free urine Occasionally this treatment is not followed by such an improvement, and it is my belief that in these cases we often are in error in our diagnosis. and probably have to deal with a mild chronic In a true low-reserve kidney, without nephritis any nephritis, the above-outlined conservative treatment will result either in complete improvement, or in preventing the condition from becoming aggravated, and it is safe to allow pregnancy to proceed to term It is well to repeat here that should the blood pressure continue to rise and an increasing amount of albumin to appear in the urine, in spite of conservative treatment, the underlying condition is not a low-reserve kidney. but either a nephritis or a pre-eclampsia, and, therefore, calls for more radical procedure

Vomiting of Pregnancy

I have discussed the treatment of the toxemias of the latter half of pregnancy and have made no reference to the toxemia of the first half of pregnancy. I regard the vomiting of pregnancy as a toxemia due to a changed metabolism. Without referring to the chemical findings, which have already been discussed in detail, I shall simply state that all evidence leads to the conclusion that the foetus utilizes mainly carbohydrates, both for its energy requirements and for the manufacture of

its fat, and there is consequently a drain on the maternal sugar. The result is a changed maternal metabolism instituted between the second and fourth months, the period of vomiting. I believe it highly probable that vomiting of pregnancy may, in some way, be associated with a change in the maternal metabolism.

TREATMENT OF VOMITING OF PREGNANCY

I do not believe there is such an entity as pure neurotic vomiting, but do admit that the neuroses or neurasthenias may play an important role, especially in aggravating the condition. The neurotic element, therefore, often needs careful consideration, and treatment must be directed to combat this phase of the disease. However, there is probably always an organic or metabolic distubance which is the underlying basis for the vomiting.

Rest in bed and careful supervision of diet often bring about a complete cure found that sometimes small but frequent meals, fairly rich in carbohydrates, are of great help In many cases the use of glucose, as well as that of insulin and glucose stops the vomiting must bear in mind, however, that occasionally, after trying each of these various methods of treatment, the condition is not relieved and in order to save the patient's life we have to resort to termination of pregnancy Although vomiting of pregnancy may manifest itself as early as at the end of the first month, a time at which the foetal carbohydrate requirements must be exceedingly limited, the food metabolism of mother and offspring seems to offer a promising field for further experimental work in the endeavor to discover the cause of this toxemia, of which we know, as yet, very little As we gain such information we may be able, in the future, to successfully treat this complication of gravidity without the necessity of destroying the life of the offspring

THE PUPIL IN DIAGNOSIS*

By THOMAS HAYES CURTIN, M D, NEW YORK, N Y

The older one grows in the practice of medicine, whether as the general practitioner or in any of the various specialties, the conclusion becomes more apparent as the years roll along, that medicine is more of an art than a science, and that notwithstanding the advances of recent years, particularly in the chemical, physiological and experimental laboratories and through the X-ray, the fleuroscope or radium, diagnoses in my opinion, are made with little more precision today than they were thirty years ago, for in the olden days, the physician had to make up by his art, what we today have gained scientifically art of observation, particularly for the minutest details, using the five God-given senses, namely, seeing hearing, smelling, feeling and tasting to This is the great essential their fullest powers for the true diagnostician

I do not, and I hope you fully understand me, deprecate the use of all the scientific aids which have been given us in these latter years, particularly the various serological tests and blood chemistries, along with the advanced technique of X-ray and fleuroscope and transillumination, but we should not allow ourselves to become dependent entirely on these, but train ourselves to be keen observers, and at times it is most gratifying to find, in the use of these aids as a check-up, that we have been substantiated in our clinical diag-

nosis by the laboratory

Now with these few preliminary remarks we have come down to the subject of the paper of the evening—The Pupil, in diagnosis

It is my intention to accentuate this art of observation, so that I will confine myself in my remarks to the pupils alone—notwithstanding the wealth of information that can be gleaned by examination of the interior of the eye by the use of the electric ophthalmoscope and the slit lamp

However, the pupil and its surrounding iris, located at the bottom of the anterior chamber, afford us an opportunity to observe through the clear cornea and aqueous the behavior of the otherwise concealed mechanism which has its connection with many localities of the brain, spinal cord and general nervous system ularities in contour, position color, size, and behavior are easily noticed and the clinical significance of each is so unvarying and far-reaching that not only ophthalmologists but physicians surgeons, neurologists, alienists and others familiar with the normal and abnormal pupil are (assisted by other symptoms) led to detect at once such profound systemic states as uremia, opium poisoning, belladonna poisoning, etc., or such grave cerebral states as apoplexy, tumor abscess, meningitis, such nervous diseases as multiple sclerosis, paresis, tabes dorsalis, hysteria, as well as such alarming emergency states as shock, fatal syncope, sunstroke, exsangumation, epilepsy, tetanus, strychnine poisoning, hydrophobia, eclampsia and death

Thus the state and behavior of the pupil is looked upon with concern by all who are familiar with the graver problems which confront the physician and surgeon as well as by the clinician in search of confirmatory evidence to assist in making a diagnosis of some obscure, incipient, vague or transitory malady affecting the cerebrospinal nervous system. For the proper interpretation of changes in the pupillary area it is necessary as in other organs of the body to know definitely its anatomy, physiology, its normal state in health in order to discern the abnormal or pathological. For in the most part this is relative

The iris is the anterior segment of the tunica vasculosa, composed of structures partly ectodermal and partly mesodermal in origin, and affords valuable data open to naked eye inspection in cases of diseased states and congenital abnormalities of other parts of the tunica vasculosa which are concealed from direct, unaided inspection (the ciliary body and choroid) and also in states referable to the nervous coat of the eye (the retina)

The independent innervation of the ciliary muscle on the one hand, and the iris on the other, the cerebral connection or association between the centers controlling ciliary action and those controlling pupillary action afford a fascinating study in cases where there is inharmomous action between the functions of these correlated anatomical structures, e g, we may have normal accommodation and paralyzed pupils, we may have paralyzed accommodation and normal pupils, we may have pupils contracted and fixed to light, or pupils dilated and fixed to light, but which contract when the accommodation effort is used, or we may have both pupil and accommodation paralyzed or in a cramped or contracted state Each of these problems has its clinical significance and they all afford interesting and valuable information

But in certain diseased or abnormal states of one eye causing unilateral blindness we have the interesting phenomenon that the pupils of both eyes will contract when the normal eye is illuminated but both (4) pupils will remain unaffected when the blind eye is illuminated. From the misbehavior of the pupil in this so-called "consensual pupillary action" useful if not indicative evidence can be deduced

The cilio spinal centers controlling the dilator muscles of the irides are located rather far down in the spinal cord (or near the first dorsal verte-

^{*}Read before the Celtic Medical Society New York, Oct. 20

The cervical sympathetic nerves emanating from these centers finally reach the dilator muscular fibers of the irides and hence it is that useful and valuable information is afforded to the clinician as to the state of health of these centers and of certain columns of the cord in their vicinity There may be inverterately contracted pupils due to paralysis of function of the cervical sympathetic nerves as seen in tabes dorsalis and other similarly degenerated states of the spinal cord, or from traumatism to the cord in this locality, causing the clinical sign known as "paralytic miosis", or there may be dilated pupils through irritation of these nerves in states of functional irritation or inflammation of the cord, as seen in certain acute toxemic states or in peripheral irritations affecting the splanchnic nerves especially observed in children and expressed in twitchings, spasms, convulsions, etc. causing the clinical sign known as "spasmic mydriasis

Brain cases The comparative size and behavior of the pupils studied alone or in connection with optic neuritis, strabismus, nystagmus, hemiplegia, etc, afford information of inestimable value. I have known brain cases where the important question as to localization was finally answered by the group of ocular symptoms aided greatly by the evidence afforded from pupillary behavior.

The width of the pupils varies in health from infancy to old age, and pupils often vary in size normally in the same individual. In infancy the pupils are contracted. In youth and adolescence, dilated, in the middle decades neither contracted or dilated, while in old age they are contracted. The pupil is never seen to dilate ad maximum in states of health during middle years of life nor is there contraction of the pupil beyond a certain point, certainly not contracted as in the infant and the aged.

In the aged we find the pupil contracted The common explanation for this is embraced in the comprehensive term, "hardening of the arteries" In sensity the capillary walls are less resilient and, since the iris is a vascular membrane, we find it stiffened from vascular sclerosis

Normal pupils are influenced by the follow-(1) Light and Shade (2) Sensory stimuli (3) Drug influence (4) Emotions (5) Bodily (7) Ceredisease (6) Sleep, coma and death bro-spinal nervous states and diseases (8) Various other conditions as refractive ones pupil is small in hyperopia and large in young myopes We note that the pupils will contract in the light and expand in darkness We also find that the pupil responds to the touch, as it were, for if the skin about the face or neck be irritated, or even if a painful inflamed part of the body like a rheumatic joint be pressed on, the pupil will dilate

Among the drugs, one class known as mydri-

atics causes the pupil to dilate, another class known as myotics causes the pupil to contract.

The pupil also responds to emotions of a violent nature, such as anger, grief, passion, etc, psychic states in which we find it dilated. In sleep the pupils are contracted in spite of the fact that during sleep we are in darkness and the eyes are closed, conditions favorable to dilation.

In death the pupil dilates but not ad maximum Among the cerebro-spinal nervous diseases, we find interesting behavior on the part of the pupil In tabes we find it contracted sometimes to a pinpoint, whereas in epilepsy and convulsions we find it dilated. Between these extremes we find many irregular and striking conditions of the pupil which aid greatly in fixing the diagnosis. But valuable as the pupil is from a clinical sense there is no single disease of the body which presents pathognomonic pupillary signs

The color of the pupil varies in different periods of life, in childhood and adolescence it is a luminous black, in middle age it appears slightly dull black, or grey black, while in old age it appears gray

There are two opposing muscles in the iris. One, the sphincter pupilae, is situated in the tissue of the iris near the margin of the pupil. It is the muscle which produces contraction of the pupil. The other, the dilator pupillar, is composed of radiating strands, which have their origin at the root of the iris and their insertion in the sphincter in which its fibers blend. This double-acting muscular apparatus is under the control of, and is directly answerable to, impulses received through different nerve fibers.

The sphincter pupillae is supplied together with the ciliary muscle by a filament of the 3rd nerve conducted by way of the ciliary ganglion and ciliary nerves while the dilator of the iris is ennervated through the sympathetic the center arising around the first dorsal verterbrae. The ciliospinal center—conducted by a complicated course through the inferior and superior cervical ganglion through caroted plexis into the skull by gasserion ganglion by way of the long ciliary nerve

Normal pupillary reactions There are two light-reflex pupillary tests in common use first is to determine the direct reaction which is produced when light and shadow are alternately made to enter the eye under observation second is the indirect, or consensual reaction as when light and shadow are alternately made to enter the fellow eye Both of these reactions, when normal, are due to the integrity of the light The mechanics of the subject are reflex arc embraced in the conversion of the one kind of energy (light), to another kind of energy (motion)

The associated reaction is a contraction of the pupil which takes place in the act of convergence and also of accommodation

The direct reaction of the pupil to light is a test which is applied to determine the state of the retina, brain or spinal cord e g, dilated fixed pupil may indicate paralysis of the brain or of the pupil center of the brain, or it may indicate irritation of the spinal cord from any cause, and contracted fixed pupil may indicate irritation of the brain (meningitis) or paralysis of the spinal The indirect cord or certain tracts in the cord or consensual reaction is a test to determine the status of the pupillary light reflex arc. The associated reaction test is made to determine the condition of the nuclear centers for convergence, accommodation and pupil contraction vergence reaction of the pupil is the most powerful pupillary reaction and the accommodation reaction is the weakest

I The commonest known pathological pupil is the "Argyll-Robertson" In the Argyll-Robertson phenomenon, which is so commonly found in tabes dorsalis, we have contracted pupils at all The pupils times whether in darkness or light do not contract to the light nor do they react when making the consensual test, but on employing the effort of convergence and accommodation they contract still further, so we have a negative direct and a consensual reaction and a positive reaction to convergence and accommodation The Argyll-Robertson phenomenon is present in about 75% of the cases of tabes It is also frequently elicited in paresis; but here the pupils are not so contracted and they are apt to be unequal in size, moreover the phenomenon is apt to be of short duration in paresis, while in tabes when present it remains very constant. This pupil test is, therefore, very valuable in diagnosing The Agyll-Robertson pupil tabes and paresis or spinal myosis may occur in other nervous diseases such as paralytic dementia, multiple sclerosis, injuries to the spine, etc. It never occurs in healthy individuals

II Physical reflex or cortical reflex is a dilation of the pupil through various mental stimuli. If a person makes a profound effort of the will, as in deep thinking or concentration, the pupils in health will dilate, or in terrified, angered or hypnotic states of the mind, they will also dilate

III Pain or sensory reflex has been referred to When painful pressure is made on a sore spot anywhere in the body the pupils are seen to dilate. This is no doubt brought about through stimulation of the sympathetic nerve which supplies the dilator pupillae

IV Hippus is a bounding of the pupil noticed while the light is unaltered. It is present to a certain degree in health when it is called "oscillations of the pupil." There is an arhythmical contraction and expansion noted while watching the pupil. It is no doubt incited from psychic influence, the patient is alarmed or apprehensive while undergoing the test. In certain cases of

hysteria where there is a subnormal stability of the nervous system, and in some cases of meningitis, mania or partial blindness from optic papillitis, the pupil excursions in uniform illumination may be astonishing, actually bounding open and shut. This is "Hippus"

V Wernckes reaction test In cases of hemianopsia when the light is focused on the blind half of the retina it is by some claimed that the pupil will not contract if the lesion involves the pupillary light reflex arc, but if the lesion is in gits, mania or partial blindness from optic papilcenters the pupil will contract if the blind half of the retina is illuminated

VI Paradoxical pupillary reactions are those which act just the opposite to the normal Paradoxical pupil behavior is an occasional symptom of disease of the cerebro-spinal axis, e g, tabes, paresis, dementia præcox, etc., or in functional neurosis, as hysteria

Abnormal dilation of the pupil is called mydriasis and abnormal contraction of the pupil is called missis

Mydriasis occurs in glaucoma, double optic nerve atrophy or total blindness from any cause which does not destroy the eye balls Mydriasis may occur from the following causes

- (1) Anything which interferes with the function of the pupillary light reflex are at any point from the retina up to the brain centers and down again to the iris, e.g. increased cerebral pressure will cause mydriasis through paralysis of the nuclear centers. The commonest causes are paralysis of the third nerve from syphilis and ophthalmoplegia interna from degeneration of the cells in the pupillary center.
- (2) Mydriasis may occur through psychic or cortical influence as in maniacal or frenzied states of the mind.
- (3) Temporary anaemia of the brain, as in fainting when the reflexes are abolished temporarily through heart failure, etc
- (4) Paralysis of the brain, as in fatal syncope, over-dosing with general anesthetics, oncoming death, etc
- (5) Locally from certain mydriatic drugs such as cocain, atropin, deturin, dubosin, hyoscyamin, homatropin, gelsemin, euphthalmin, etc. Constitutionally from poisonous doses of certain other drugs as aconite, canabis indica, chloral, chloroform, cocain, comum, digitalis, ergot, gelsemium, nitrate of amyl, nitro-glycerine, sanguinaria, stramonium, turpentine, scopolamin, wood-alcohol, quinin, etc., some of these in physiological doses produce contracted pupils, but all in lethal doses produce dilatation
- (6) Dilation of the pupil also results from stimulation of the sympathetic nerve supplying the dilator pupillae, such as noted in sensory skin and painful pressure reaction, pinching the

superior cervical sympathetic ganglion or sticking pins in it, as in a case of hysteria in a nurse who wanted to be operated on for imaginary brainabscess, spinal irritation from any cause such as traumatism, myelitis, spinal meningitis in early stages, gastric and intestinal disturbances, which incite unconscious states, as convulsions in children, as well as teething, shock, real and psychic, as a good spanking, a ghost story, night terrors, anything which "makes the skin creep and the hair stand on end," will stimulate the sympathetic nerves to the iris and cause pupil dilatation

Contracted pupils are found in all inflammatory conditions of the eye

Miosis—(1) Iritis, ulcers and abrasions of the cornea from congestion of the iris blood-vessels and reflex sensory irritation. The one exception is acute glaucoma

- (2) Plethoric states of the brain, as in acute nigh fevers, acute meningitis from any cause, uremia, alcoholism, etc
- (3) Paralysis of the sympathetic from any cause be it central, intermediate or peripheral
- (4) From certain drug influence as when eserin, physostigmin, pilocarpine, or arecain in solution is dropped in the eye
- (5) Poisons, inwardly, as opium and its salts, carbolic acid, creosote, alcohol in lethal doses, chloral at first, jaborandi, pilocarpin, muscarin, etc

We should keep clearly in mind that paralysis of the sympathetic nerve from any cause contracts the pupil to a pin point (spinal miosis) and paralysis of the brain causes widely dilated and fixed pupils, while stimulation of the spinal cord causes dilatation and stimulation of the brain causes contraction of the pupil In giving general anesthetics, we must decide whether the sudden dilatation of the pupil, sometimes present is due to spinal irritation from gastric disturbance or whether there is oncoming paralysis of the brain In suspected poison cases we must decide whether the contracted pupil is from opium or from uremia In suspected "drunks" whether the contracted pupil is from meningeal irritation due to apoplexy, uremia or sunstroke We must look

at the pupils in suspected acute tuberculosis or pneumonia of one lung, for that slight dilatation is a diagnostic sign. We must note and understand that hippus is present in hysteria, chorea or mania, the widely dilated pupils due to increased brain pressure in brain tumors or brain abscess, the dilated pupil on one side in haemorrhage in one hemisphere of the brain, the Argyll-Robertson pupil in spinal syphilis, the unequal, deformed, and more or less fixed pupils in general paresis or cerebral syphilis, the normal pupils in sham fits

This paper would not be complete without speaking of anisocoria or inequality. Inequality of the pupils occurs in healthy persons. If not associated with pathological conditions, it may be due to the following conditions.

- (1) Different refraction of two eyes
- (2) Unequal illumination
- (3) Unlike conditions—adaption of the retinae
- (4) Inequality of action to closure of lids

Anisocoria in some cases is due to irritation of the sympathetic, which is the enervator of the dilator of the pupil, illustrated by enlarged glands of the neck, aneurysm of the carotid

In many intestinal diseases monocular mydrasis may be noticed as a symptom Schauman (Bel Klein) estimates that 23% of all internal diseases at some time during their course give rise to this symptom. He mentions appendicitis, diabetis, neurasthenia, lung affections, pleuritis, cardiac diseases, chlorosis, pernicious anaemia. There is one grave disease in which a partially and slightly sluggish pupil is a constant symptom and that is paresis. Cases have been reported of irregular pupils in arotic aneurysm, but on investigation were regarded as not due to cilio spinal ennervation, but as due to syphilis of the nervous system.

The behavior of the pupils in health and disease affords valuable and interesting study to any one who understands the impulses controlling the phenomena of pupil contraction, dilation and rigidity

IDEALS, STANDARDS, AND ACTUALITIES

The mainsprings of action of physicians are ideals, standards, and actualities

Ideals are aspirations of the mind and soul soaring aloft beyond physical limitations

Standards are ideals arrested in their flight, tied down to the printed page by language and logic, and subjected to special restrictions of human knowledge, equipment, and personality

Actualities are ideals confined to earth by all the conflicting influences of human life and conduct with their imperfections and limitations, economical and temperamental

Medical ideals tied to actualities are still potent and show their dominating influence in therapeutics, in ethics, in society administration, and in medical journalism 90 EDITORIALS

STANDARDS OF PERSONALITY FOR PHYSICIANS

Who is the ideal physician? and by what standards shall he be measured?

Physicians form an honorable brotherhood, and among them there is a common bond of interest and fellowship, and a high ethical standard Physicians meeting one another as strangers soon become acquainted as they mutually share a fund of knowledge and experiences which are hidden from the uninitiated

Medical brethren come to know one another more intimately than the members of any other profession. Their work brings them into close contact with people in times of sickness and trouble when the afflicted confide their secrets to the doctors and nurses, and when one physician must often rely on the friendly assistance and support of another who is his keen competitor. It is to the honor of the medical profession that physicians meet the tests in nearly every instance, and that a departure from the high standards of brotherhood and ethics is the great exception.

Whence come the friendliness of the doctor, his cooperative spirit and his high standards of ethics? Is it because of his training? or is he born into the high estate of a family doctor?

The doctor is both born and made. The first test of candidates for their fitness to study medicine begins at the door of the medical school where the applicant must present evidence of fitness along the lines of preliminary education and character

The preliminary education that is required is far more than the possession of facts transferred from books to the pages of memory. It involves skill in methods of scientific research, for the future student and practitioner of medicine will be an investigator into the nature and causes of sickness, and must read a confusion of conflicting signs which are not set forth in books.

A medical student's preliminary education also involves skill in forming correct conclusions from given facts, and in applying those conclusions so as to affect human actions. The medical practitioner must be more than a cold scientist who adopts a "take-it-or-leave-it" attitude toward his patients, and on the other hand he must avoid trimming his conclusions to fit the wishes of his patient

Mental traits usually show themselves during the student's pre-medical course, and those students with gross deficiencies will be excluded from the medical school. While in former years practically every applicant was received into a medical school, only one out of five is now permitted to enter upon the study of medicine. This limitation of students to those of like mental traits is one of the great reasons for the present harmony among physicians.

Certificates of character are also required from applicants to enter a medical school, but character is an elusive condition, for it has an element of

temperament as well as a moral quality. A student in the premedical school reveals his moral qualities by his social adaptabilities, but he is not subjected to tests which reveal his less evident temperamental qualities. The student with the one-track mind and cold logic slips in beside the timid one who fears to make a decision. Temperament enters into success or failure so frequently that one regrets the inability of the medical schools to determine it before the student is permitted to study medicine.

permitted to study medicine

The second great test of a candidate for the practice of medicine comes at the hospital at which the newly graduated doctor seeks an interneship The question of his preliminary education is usually shown by his diploma of gradu ation from his medical school, and a good moral character is also assumed, but the question of temperament becomes an important issue Here for the first time in the student's career the embryo doctor is subjected to a severe test of his power of adaptability to the wishes and feelings His work compels him to be intimate with his patients, his visiting staff, and his interne colleagues, and whether he wishes it or not, he must give grave consideration to the effects of his actions on everybody with whom he comes in con-He must adapt himself to the whims of the sick, to the petty peculiarities of the visiting staff, and to the rough and ready jibes of his com-These very same conditions he will meet in his private practice, and the wise interne will adapt himself to them at the outset value of an interneship consists in the training in adaptability as well as in scientific medicine

Hospitals are laying more and more emphasis upon temperamental adaptability as a qualification of its internes It would seem to be easy for a fine medical student to secure evidence of his adaptability from some practicing physician who knows him well, but frequently the best men go through a medical school without forming the intimate acquaintance of a doctor The preceptorial system was too valuable ever to be discarded The old doctor showed his student how to adapt himself to his patients and to the leaders in the community, and when the graduate sought a testimonial of fitness, that from his preceptor weighed more than all others It will well repay every medical student to form the intimate acquaintance of some doctor in the practice of medicine

The third great test of a physician comes in the county medical society after he begins his medical practice. The medical school has ground and polished his intellect, and the hospital has screened out the grosser imperfections of his conduct, but his temperament remains, and is likely to assert itself in its true aspects when the inhibitions of his training career have been removed.

The county medical society is the physician's

medical school and interneship, and whether he takes it or not will depend largely on his temperament. Some physicians are instinctively unsocial, and see no need of the county medical society. Others are satisfied with their present knowledge, and see no pecuniary returns from continued study. And so less than three fourths of the physicians of New York State avail themselves of the benefits of the county medical society. Actual criticisms of the societies are now seldom heard—the non-members seem to think they are doing well enough without the giving and receiving of benefits which the society offers

Temperament also asserts itself among the members in the society Fortunate is the county medical society in which a few members have a

civic spirit, and delight to arrange programs, to teach their fellows and learn from them, and to discharge the civic duties which the medical profession owes to the community. The successful officer of a county medical society is one whose temperament enables him to put himself in the place of his fellow members, to appreciate their line of thought, and to develop plans which appeal to the great majority of the physicians of his county.

The county medical societies of New York State are making increasing appeals to physicians of all temperaments as they expand their activities beyond those of science and economics into social and educational fields. The county society offers benefits to physicians of every temperament.

LAW FOR PHYSICIANS

Physicians know many points of law, but they are deficient in their knowledge of the fundamental principles on which law is founded. A family doctor is not expected to be a lawyer, but he should know sound law when he sees it. He criticizes the lawyer who expects miracles in medicine, and the lawyer is equally critical when the physician talks of legal matters.

Mr Lloyd P Stryker, the counsel of the Medical Society of the State of New York, makes the important announcement on page 97 of this Journal, that he will prepare a series of articles on the fundamentals of law, which will appear in the Legal Department of future issues of this Journal Look for the articles and read them with special care

LOOKING BACKWOOD

THIS JOURNAL TWENTY YEARS AGO

Tetanus Following Operation — The possibility that tetanus may follow operations on the intestines done under apparently aseptic conditions has long been known to surgeons The condition develops more frequently than is usually admitted. The leading article of the January, 1908, issue of this Journal is a report by Frederick H. Flaherty of Syracuse, describing a fatal case of tetanus following the injection treatment of hemorrhoids. After reviewing some of the cases in literature Dr. Flaherty wrote

"I have reported the foregoing cases as they show the type of operations most often complicated by this dreadful disease, the time at which it usually appears, and the possible source of entrance of the tetanus germs. Jacobson, in his paper, calls attention to the fact that the tetanus bacillus is a frequent inhabitant of the intestinal tract of animals, and quotes Pizzini as having found them in the feces of man. He offers this as an explanation of the occurrence of tetanus in clean operations upon the intestinal tract.

"In the case I reported I had every reason to believe that the infection gained entrance through the rectum previous to my operation. However, it is evident from the reported cases that tetanus does occur in what we consider strictly aseptic operations. It occurs at a time after what usually is a normal convalescence of six to twelve days, when the surgeon has every reason to tell his patient that he is out of danger, and when suddenly, like a bolt out of a clear sky, trismus, difficulty of swallowing and convulsions occur, and the patient is dead in a few days."

It is surprising how closely Dr Flaherty came to the modern explanation of the usual cause of tetanus after operations on the intestines. The reason lies in the presence of tetanus spores in about five per cent of normal persons. Surgeons need not suspect catgut sutures prepared by the modern method of sterilization at a temperature of 329° F for five hours (see this Journal, October 15, 1927, page 1156)

MEDICAL PROGRESS

Hypoglycemia, with and without Insulin, with and without Symptoms—Benjamin I Ashe, Herman O Mosenthal, and George Ginsberg, writing in the Journal of Laboratory and Chinical Medicine, November, 1927, xiii, 2, present a report on three patients with low blood sugar, two with the symptoms usually associated with hypoglycemia and induced by insulin, the other patient free from such symptoms and never having had insulin The histories in these cases, as well as the review of the literature, demonstrate that the signs and symptoms of hypoglycemic reaction are subject to wide variations There may be no symptoms though the blood sugar be very low (003 per cent. in the third case), such instances apparently are not very rare in children but occur infrequently in adults On the other hand, in certain individuals, hypoglycemic reactions manifest themselves, though the blood sugar be at the accepted normal levels In one of the cases cited the blood sugar after moderate insulin therapy (45 units in twenty-four hours) was at the zero level The symptoms accompanying depression of the blood sugar may resemble those characteristic of other diseases and lead to incorrect diagnoses as, for example, in the first case in which there was a right facial paralysis and left hemiplegia Special attention is called to the serious situations created when hypoglycemia, brought on by insulin administration, results in loss of voluntary control of thoughts and actions Inanition and dehydration may be factors in the production of hypoglycemia, and may have been responsible for the low blood sugar in one of the cases reported, since abstinence from food, especially when coupled with excessive consumption of the body's storage of glycogen and glucose, appears to be a common cause for unexpected and even marked lowering of the blood sugar

Operative Treatment of Asthma -A Herrmansdorfer of the Munich surgical clinic writes critically of Kummell's operative treatment of asthma as proposed by him in 1923 The intervention consisted in the extirpation of a certain portion of the cervical sympathetic, but Brunning and others have claimed that the bronchomotor conduction really passes The author claims that through the vagus the critique is unwarranted, for both dilator and constructor fibres pass through each of the nerve paths although the vagus innervation predominates, so that one might assume that the vagus fibres are those which should be sectioned Recently Kümmell and Sudeck have

improved their results by dividing both nerve fibres at the posterior pulmonary plexus where they unite But it has not yet been shown beyond doubt that asthma paroxysms originate through an excitation of the vagosympathetic fibres, and few have learned that these paroxysms can originate in the absence of such innervation Moreover, certain drugs, like muscarine, can elicit asthmatic attacks after all of the afferent nerves have been sectioned. The many allergens which can induce asthma do so without invoking the vagosympathetic mecha-The fact that so many and diverse agencies can relieve asthmatic attacks points to the strong suggestive element which underlies all asthma therapy All things considered, it seems unscientific to treat the affection by surgical intervention which mutilates important structures -Munchener medizinische Wochen schrift, Oct 21, 1927

Origin of the Pains of Gastric and Duodenal Ulcer-W L Palmer of the University of Chicago publishes his views on this subject in the Klimsche Wochenschrift for October 29, 1927 These he sums up as follows Unobjectionable cases of either form of peptic ulcer have never been published in absolute achylia gastrica (histamine negative test) If an ulcer is found in such a patient the painful symptoms should be studied very carefully in order to make sure that they really are due to the ulcer Usually if the stomach is washed out at the height of the pains the contents show high values in chlorhydric acid Further, the introduction into the stomach of solutions of this acid closely imitating the natural juice in amount and concentration call forth the pains if the time is right, while either evacuation of the stomach or neutralization of its contents with alkalı will bring the pains to a stop author would emphasize that the pains may often be elicited by concentrations within normal limits No connection can ordinarily be found between the pains and the tonicity, motility, or spastic state of the stomach or duo-The pains are doubtless determined by the action of the acid on the inflammatory reaction in the ulcer with, in certain cases, the action of peristalsis As regards the pains of cancer of the stomach, the same factors may give rise to the symptom, although this is not the rule To his brief article the author appends a long bibliography of the subject

Optic Neuritis—It is the opinion of J V Patterson that the classification of cases of

optic neuritis should be based on a full investigation of the case as a whole, and not merely on the observer's idea of the disc changes When studied from this wider point of view cases of optic neuritis fall into two main classes, those associated with intracranial pressure (due to neoplasm, cyst, abscess, gummatous or tuberculous nodules, aneurysm and blood extravasations, sinus thrombosis, meningitis, skull deformities, etc) and those produced by inflammatory processes The latter group may be subdivided into two one group characterized by inflammatory processes which develop in the nerve sheath and spread by contiguity to involve the nerve, and another great group due to toxins circulating in the In none of these groups can certain differentiation be made by ophthalmoscopic appearances alone, but must be based on a study of the visual disturbances and of the history and general symptoms. In cases of intracranial pressure, spinal fluid examination, careful study of ræntgenograms of the skull, and the Wassermann reaction are helpful Disc changes are more pronounced in cases due to intracranial pressure than in those due to inflammatory processes, in the latter group disturbances of vision come into prominence, central scotoma with visual failure being common and characteristic Subjects of intracranial pressure with disc changes should be operated upon in the early stages. In brain abscess, however, the results of operative treatment, once the stage of optic atrophy has been reached, are apt to be very disappointing In addition to the groups mentioned there are many cases for which an adequate explanation is wanting and which are attributed to invasion of the optic nerve from the posterior nasal sinuses While Patterson admits that many cases of retrobulbar neuritis, mostly of the chronic persistent type, have this origin, and that the patients have undoubtedly been cured or relieved by free operation on the diseased sinus, he does not believe that the common acute variety of retrobulbar neuritis has been proved to be due to a spread of inflammation from the sinus to the nerve committee of oculists and rhinologists, formed to cooperate in investigating the relation of sinus trouble to visual disturbance, found little if anything indicative of such a relation-It is easy to be deceived regarding the efficiency of operation in cases of acute retrobulbar neuritis in young adults In several of the writer's cases in which operation was deferred recovery took place spontaneously --British Medical Journal, November 12, 1927, 11, 3488

Peroral Immunization against Diphtheria
—W Pockets of the Hamburg-Eppendorf
Hospital asks if it is possible to immunize

against diphtheria perorally with killed cultures of diphtheria bacilli He had previously made a positive report on peroral diphtheria toxin-antitoxin as an immunizing agent. There is reason to believe the bacilli found at times in the upper respiratory passages of the healthy have produced an immunity or at least are evidences of such immunity Breton and Petit found immune bodies in the blood after having injected killed cultures of the bacilli into the The experiments of the author were as follows Thirty-two children received doses of killed bacilli and in from four to seven weeks 28 were found to be negative to the Schick test Blood tests, however, showed that this immunity was not a strong one, so that we cannot count on actual protection against the disease It is possible, of course, that the Schick test is of more value as a measure of immunity than the amount of antitoxin found in the blood Tests made four weeks after ingestion of bacilli did not result in any immune reaction, so that a second test was made two weeks later with positive finds author does not allude to the possibility that a combination of peroral toxin-antitoxin with peroral killed cultures might prove more serviceable than either alone —Klimsche Wochenschrift, November 5, 1927

Studies on the Perspiration—Karl Eimer states that a grown man in a state of rest and under medium atmospheric conditions gives off from 600 to 700 cc of water in 24 hours, this not including a certain amount of transudation in which the sweat glands are not concerned Certain species of animals are without sweat glands and it is probable that transudation takes place in such, for experiments on dogs with pilocarpine show that a certain amount of water escapes from the skin despite the absence of sweat glands, even if extremes of exercise and heat are insufficient to reveal it The rabbit is different in this respect for it possesses skin glands which are inactive under all ordinary circumstances, but by means of an apparatus devised by Schwenkenbecher they may be activated. Certain factors increase while others diminish the excretion The sum of the studies on living and dead rabbits throws light on the nature of glandless perspiration This depends in the first place on the permeability of the blood vessels of the skin to the blood, for the greater the volume of these the larger the amount of perspiration escapes from the capillaries of the cutis into the lower layers of the stratum corneum, passing then into the hygroscopic superficial layers Both osmosis and secretory activity of the epidermal elements are probably involved The process then becomes one of simple evap oration —Deutsche medizimsche Wochenschrift, November 4, 1927

Peculiar Breath Odor in Decompensated Heart -W Ruhmann comments on the recent statement by Assmann to the effect that patients with marked decompensation of the heart's action have a peculiar breath akin to the breath of the dying and corresponds to the smell of the recent cadaver discovery by Assmann is of great interest, for while there is no direct connection between the two odors—since the decompensated patient may be far from death—the mechanism may be the same The author has noted this smell, not so much in the dying as some hours before death actually occurs—perhaps many It strongly suggests the cadaver and the autopsy room Naturally it persists up to the death agony It does not appear that all of these patients present this smell, but the author cites several cases, which varied considerably among themselves, in which it was In one case there was myodegenerapresent tion of the heart while the others had an infraction of that organ The first named patient died of the complication of edema of the lungs, while the latter died with foamy serous sputum, and the odor did not become pungent until this symptom had developed odor suggested raw meat or the cut surface of raw organs like the lungs For the present the author associates it with stasis in the lungs and the accumulation of serous fluid in the alveoli, which clinically may or may not give the picture of pulmonary edema -Munchener medizinische Wochenschrift, October 28, 1927

The Cardiac Cripple — Charles W Hurlburt gives sound advice for the guidance of the cardiac cripple and urges the need of better service in hospitals and clinics for these patients He emphasizes the importance of a careful history, giving special attention to habits and previous illnesses, and of a thorough physical examination, which should include a search for foci of infection tory examinations of the blood and urine are also essential A high white count or a low red count carries insistent indication for treatment Exercise is probably more necessary for the cardiac cripple than for the healthy person, the rule being work or exercise short of the amount producing dyspnea and pain In the short, thick-necked individual, where puffing and blowing and increasing lividity accompany almost any exertion, exercise may be persisted in despite cyanosis If the patient requires more exercise than his heart will allow, massage, especially applied to the abdomen, may be substituted Due attention must be given to securing regular and adequate rest and sleep, in case of much cardiac damage rest after meals is essential It is imperative that large meals be avoided Digestion will be

better when foods that require thorough mastication are provided, and when all foods, even milk, are thoroughly mixed with saliva Because of the effect on the heart of sudden cooling, cold fluids should be markedly restricted or altogether abolished Constitution must be dealt with according to its type. If it is associated with general abdominal congestion, the wearing of an abdominal support may be helpful Sulphur lozenges (5 grains), three or four at bedtime, or, if necessary 40 to 60 grains of compound powder of jalap, with a mercurial purge once a month or oftener, may If a saline cathartic is required, sulphate of sodium can be given over longer periods than sulphate of magnesium Flatulency may be ameliorated by using acid potassium tar-The day has passed when the mere presence of a heart lesion calls for digitalis, though the fibrillator will probably lead a digi-In paroxysmal tachycardia the talıs lıfe routine use of small doses of quinidine may lessen the frequency of attacks For nervous patients, or those with pain (not relieved by rest and proper exercise) the best remedy 15 the bromides, or luminal, with severe pain chloral may be required Extreme cold and high altitudes are not well borne In hypertensive and aortic patients high altitudes may cause sudden dilatation of the left heart with edema of the lungs -Canadian Medical Association Journal, November, 1927, xvii, 11

The Action of Expectorants — J A Gunn, writing in the British Medical Journal, November 26, 1927, 11, 3490, states that expectorants may increase the bronchial secretion in one way or in a combination of four ways, depending upon their site of action They may act (1) reflexly through gastric irritation, (2) by stimulation of the vagus center, (3) by stimulation of the secretory (vagal) terminations, and (4) by direct stimulation of the secretory glands Upon the differences in site of action largely depends the superior suitability of certain expectorants for certain conditions Ipecacuanha, tartar emetic, ammonium carbonate, squill, and senega increase the bronchial secretion by reflex action, the afferent stimulus for which is the irritation of the gastric mucosa An emetic to be of practical value as an expectorant must not produce such an intense irritation of the gastric mucosa as to cause serious or permanent gastritis, while the mild gastric irritation which it produces must be sufficiently prolonged to make its administration worth while Ipecac is a more certain and effective expectorant in children than in adults, this is probably because the emetic center is more active and sensitive in children The superiority of ipecac to potassium iodide may be due to the diuretic action of the former, which would be of value in lowering the temperature in febrile cases Ipecac probably acts to some extent centrally, and possibly so also does tartar emetic Apomorphine acts entirely by central stimulation, but is not as valuable as ipecac, probably because its action is too transient. As a stimulant of secretory nerve-ends, pilocarpine is seldom used, since great accuracy in dosage is necessary to avoid undesirable after-effects When, however, the central nervous system is profoundly depressed, it is possible that reflex emetics are relatively inactive, and under these circumstances pilocarpine might be a valuable expectorant The iodides act as direct stimulants of the bronchial glands, and independently of the central nervous system, they are less useful for children than for adults There is no pharmaceutical justification for classifying expectorants as stimulants and depressants, squill and senega have been placed in the former category, whereas they act by gastric irritation There is no reason for avoiding their use in acute bronchitis Squill has a digitalis-like action on the heart, and is also a diuretic, it is especially in chronic bronchitis that these qualities would be likely to be of Hydrocyanic acid exerts a local anesthetic action on the pharynx and stomach, but has no direct action on the respiratory system, it will relieve only a cough that is secondary to pharyngeal or gastric irritation

The Sulphur Treatment of Paresis — K. Schroeder refers first to the original incurability of this affection and the discovery that it can be overcome by the fever treatment, especially by malarial blood There are certain objections to this plan of treatment and it is desirable to discover a fever-producing drug which is devoid of these drawbacks Sulphur has been recommended as such a substance and the first case in which it was tested, which was a most unfavorable one, gave a brilliant result, a remission following which has amounted to a 3 year cure. The author has treated but 7 of these patients and in 2 the treatment is still in progress. Of the other 5 with treatment completed 3 are virtually cured, but the remaining 2 have not shown any improvement. The sulphur was of the purest and finest powder and was injected into the muscles in an oil suspension. The amount injected varied within wide limits but as a rule was at first small-1 cc of a 1 per cent suspension—and was gradually increased to ten-fold as much In about 12 hours the acme of a reaction was seen to occur in which the temperature might go as high as 105° F, but soon dropped to normal The injection could be repeated in 24 or 48 hours. The high temperature was sometimes preceded by a severe chill, malaise, and vomiting This peculiar activity of the mineral is not due to any special therapeutic action of the sulphur as such but resembles that of other colloids. As sulphur is not itself an antiseptic a minute amount of chinosol is added to the suspension after the latter has been sterilized by heat—Khnische Wochenschrift, November 12, 1927

Treatment of Seasickness —Before treating a patient for seasickness G H Oriel urges the importance of ascertaining that no grave underlying disease is present, such as acute appendicitis, intestinal obstruction, perforation as of a gastric ulcer, or typhoid or paratyphoid Whatever the initial cause of vomiting, whether nervous disturbance, labyrinthine stimulation, irritation of the splanchnic sympathetic, gastric irritation, or ketosis following hypoglycemia, the persistent vomiting combined with the absence of food soon causes ketosis It is vital, therefore, to administer carbohy-The easiest and pleasantest way is to give orangeade made with glucose (one tablespoonful of glucose to one squeezed orange in a glass of ice-water) In addition to the glucose various drugs may be tried. The list includes atropine, tincture of belladonna, cocaine, sodium bicarbonate, chloretone, potassium bromide, morphine, hyoscyamus, dilute hydrocyanic acid, cerium oxalate, and many others None is specific, but some are helpful under different circumstances Potassium bromide, 20 grains, with 25 minims of belladonna, or chloretone in 5 grain doses not oftener than twice a day, is useful in nervous patients Atropine, 1/100 of a grain, with strychnine, 1/32 of a grain, may be given when the patient shows signs of collapse When nothing can be retained by mouth, a suppository of chloral hydrate (15 grains) and potassium bromide (30 grains) may be used three times A useful routine mixture consists of two powders (a) potassium bicarbonate, 15 grains, (b) citric acid, 10 grains, glucose, 4 drams These dissolved in water give a palatable effervescent drink, which often cuts short an attack. In severe cases, with coma threatening, glucose should be administered with saline per rectum every four hours patient should be kept quiet and the air fresh, as oxygen scarcity is a direct precursor of ketosis On short voyages poor sailors should partake of a good meal two hours before embarking, and should take 5 grains of chloral or 10 to 15 grains of potassium bromide Immediately on embarking the dose should be repeated, and the patient should lie down presence of acetone in the urine is a sign that more glucose is required —Lancet, November 26. 1927, cexiii, 5439

LEGAL

By LLOYD PAUL STRYKER, Esq Counsel, Medical Society of the State of New York

THE FUNCTION AND THE PURPOSE OF THIS PAGE

It has been a source of gratification and encouragement to the writer in his travels about the state and in his very numerous contacts with the members of the medical profession, to be told that his editorial page is usually read. While this is a source of deep gratification, it has also filled the writer with a sense of obligation to continue, if possible, to make this column interesting, valuable and worth reading

To the writer perhaps, as to no other layman, the opportunity has been accorded of studying the problems, the aims, the aspirations and the hopes and fears of medical men His admiration and respect for the ideals of those who spend their lives in practicing the healing art has grown from day to day The contributions which they make to the dissemination of scientific knowledge and the application of this knowledge to human pain, suffering, deformity and other physical conditions, although increasingly understood by the lay public, is appreciated all too little

The writer from time to time hears the praises of the doctor sung, but also he is brought in his daily work, in close intimate contact with both the general and specific criticisms which are leveled at the medical profession. From his experience and intimate contact, he is becoming daily perhaps more capable of appraising both

What he would like to do in this column is by advice, encouragement and sound understanding, to furnish the profession in general, as he endeavors from day to day to furnish the individual practitioner, with sound counsel, advice and real assistance This is by no The subject is as broad means an easy task as medicine and law, and these combined subjects cover a domain as large as human nature Your help and your suggestions will be of infinite benefit to him in endeavoring to carry on this work and in his sincere effort to make this page a clearing house for the discussion of the subjects which you wish to hear discussed

The writer makes no pretense either to omniscience or clairvoyance. He cannot know the subjects which most interest you unless you tell him, nor when he knows them can he bring to bear upon the discussion all the wisdom of the ages, but he will use to the best

of his ability, all of his knowledge and ex-

perience in this special field

In the issue of November 15, 1927, for example, the writer published an editorial entitled "The Endorsement by Physicians of Commercial Products" In this article the recent practice of physicians in endorsing purely commercial products was commented To the writer it seemed that such a course is not calculated to advance the best interests of the profession, and he said so very frankly Since the publication of that article, we have been informed that it has been the subject of wide and usually of favorable comment throughout the United States, both in the medical and lay journals writer advocated the enactment of a new article to the principles of professional ethics which would condemn this practice He believes that this would be a wise course, but whether it is or not, naturally involves a question which must be decided by the medical profession This article was discussed in the "Public Forum" of the New York Medical Week in its issue of December 17, 1927, which carried a very interesting letter from Dr. J. Milton Mabbott "Instead of enacting another article to be added to our principles of ethics, as suggested by Mr Stryker," writes Dr Mabbott, "I call for further examination of the evidence How many cards were included ('but not read' by the accountants) which did not confirm the statements? Or was there a separate file of cards from physicians disagreeing (if any) and those expressing no opinion? What was the whole number of cards sent out and how many altogether were returned? * * As a member of the House of Delegates, I call upon our legal counsel for a more detailed report of the 11,105 cards and any other before we undertake the imposition of further restrictions upon a long suffering profession If all these doctors, with the single exception of myself, are guilty as charged, Mr Stryker has not protested enough Only I cannot believe it without more proof! Mr Stryker invites discussion and this is my response"

It may well be, as Dr Mabbott suggests, that the firm of accountants who classified the cards endorsing the brand of cigarettes in question, purporting to come from the physicians enumerated, received other cards

which did not carry such endorsements. But whether this is so or not does not affect the issue. The question is not how many physicians were willing or unwilling to endorse this particular commercial product, but that it appeared that some 11,105 doctors had done so. If so large a number of physicians resorted to this practice and the practice is not to be approved, then the fact (if it be a fact) that another group, perhaps equally large, refused to make such endorsements would not change the conclusion that the practice resorted to by those who had, is not desirable

It would be, we feel, a misinterpretation of the writer's article and of his known point of view to conclude that he is indiscriminately in favor of the "imposition of further restrictions upon a long suffering profession" He is in favor only of that which to the medical profession as a whole may seem most conducive to the advancement of the profession and of the public confidence and esteem, in which it is and should be held

Let it not be understood, however, that the writer entertains any feeling of displeasure at Dr Mabbott's criticism of his article, rather he is gratified that what he has written should have been of sufficient interest to provoke discussion. From discussion, from the attrition of debate, sound ideas and principles are likely to emerge. If the writer succeeds merely in rousing interest on such questions, he will feel that he has performed his duty no matter what the ultimate decision may be upon any suggestion which he may advance

Criticism, advice and discussion, therefore, on any topics contained within this page, will be here welcomed and will be dealt with on the merits. No doubt, there are many other subjects of interest which have not been brought to our consideration and as yet have found no place here. If you will advise us what they are, such suggestions will be wel-

comed and may help to make this column as valuable as we should like to have it

Recently a suggestion has come to us that there is a large field of medico-legal questions, some of them perhaps of a more or less elementary character, which the medical profession would like to hear discussed. This suggestion has been revolving in our mind, and from it we have concluded to present from time to time in the coming issues, fourteen editorials under the following titles.

- 1 Law-its origin, growth and function
- 2 Constitutional law
- 3 Statute law
- 4 Common law
- 5 The police power of the state
- 6 The problem of ascertaining what the law is
- 7 Is law a science?
- 8 The origin, authority and function of the Health Departments
- 9 The application of law to medicine
- 10 The legal duties and the liabilities of the physician
- 11 Confidential communications
- 12 Expert testimony
- 13 The doctor's relation to the administration of the criminal law
- 14 The need for a better understanding between the legal and the medical professions

These articles will not appear serially in every issue, as many of them will require, as the topics suggest a mature study and reflection. In these, however, as we find occasion to write them, we shall endeavor to discuss the matters suggested under the respective titles in such a way as to interest the profession. These articles may suggest the need for still further discussion of a like or a similar kind.

INTESTINAL TOXEMIA AND CONVULSIONS

In company with its parents, a child of about one year of age, was spending its vacation in the mountains. The child became ill and a physician was called to attend him. An examination by the physician disclosed that the child had a congested throat and was suffering from overeating, this infant was being fed a full diet of solid foods and practically all the foods which were served at the dining room table at the house at The congeswhich the parents were boarding tion of the throat and bowels had caused the child to have a high fever. An enema was administered to the child by the physician and a physic of calomel followed by castoria or its like, Instructions were also given were prescribed

to the mother as to the proper diet for the child, that no food was to be given for twelve hours and then a very mild diet of strained cereal and milk, but no solids at all. A few days later the physician was called by the mother and told that the child was perfectly well. About a week later the physician was called to attend this child. An examination at this time disclosed a temperature of 101°, pulse and respiration normal. The physician was told by the boarding house keeper that the mother had never placed the child upon a diet and had been feeding it solid foods. At this time the throat of the child was congested. There was no complaint of diarrhea or vomiting. The physician administered a tablespoon of milk.

98 LEGAL

of magnesia and again directed the mother as to the proper feeding of the infant. He also prescribed a half grain of phenacetin and two grains of aspirin, to be given one every three hours Contrary to the physician's instructions the mother had kept the child outdoors instead of inside At about 4 o'clock in the afternoon the mother found the child in the carriage blue and The physician called about 4 30 and found that the child had just been taken indoors and put to bed An enema was given to the child, which returned a quantity of mucous slimy stool, containing pieces of orange peel and orange pits The physician's prescription had likewise not been given to the child The mother was told to give the infant thirty drops of whisky and to repeat in about three hours if the child did not act better, to keep the child thoroughly warm and to advise him in the morning of the child's During that evening the physician telephoned the mother and was told that the child was doing nicely

On the following morning, at about 7 A M the mother called the physician and upon arriving at the house was told that the child had had a very bad night The temperature at that time The physician personally administered an enema to the infant at this time and got a return of more orange peel and orange pits, mucous slimy stool, giving evidence of intestinal Calomel was then prescribed two hours later the physician was called by the boarding house keeper and told to come up, that it might be too late at that time as the child might be dead. He immediately went up and found the child in convulsions, with the mother administering a mustard bath The child was cyanotic, in convulsions, rigid, trembling and foaming from the mouth The physician immediately started colonic irrigations and got con-

tinuous returns of orange peels and pits and The irrigation and mustard bath mucous stool were continued and the child warmly wrapped. but the convulsions could not be checked. The physician was about to administer a hypodermic of luminal, but upon the protest of the mother and the other persons in the room he did not do so and emptied the contents of the syringe At this time another physician was called to as-He continued the colonic irrigations and gave medication by mouth On his visit at 7 o'clock in the morning the physician had advised the mother to remove the child to the hospital, but the mother had refused to do so. At the time the second physician called it was decided to take the child to the hospital, the nearest hospital being forty miles away The second physician accompanied the child to the hospital When the second physician returned from the hospital he advised the defendant physician that the child The death certificate was signed by the second physician, the cause of death being given as intestinal autointoxication, contributory cause convulsions

When the parents of this child returned to the city they instituted an action of alleged malpractice against the physician to recover for the child's death, claiming that it had been caused by the improper treatment of the defendant. It was further claimed that the defendant had been called to treat the infant who was suffering from a cold in the head, that he had likewise improperly and negligently prescribed and administered excessive and injurious medicines, which caused the infant to become ill after taking one dose, resulting in the death of the infant within a short time thereafter

When the action came on for trial, the plaintiff not being ready to proceed, upon defendant's application the complaint was dismissed

NEWS NOTES

BRONX COUNTY

The Annual Meeting of the Bronx County Medical Society was held at The Bronx Professional Building, on December 21, 1927, at 9 P M, with the President, Dr Friedman, in the Chair

The Secretary presented the following proposed Amendments to the By-Laws, which were introduced at the November meeting

Section 11—Standing Committees—Add

, a Committee on Public Relations of five members Committee on Public Relations

Section 81 (a)—

The Committee on Public Relations shall co-operate as far as practicable with the welfare and health agencies operating in Bronx County. It shall be guided by the suggestions of the Standing Committee on Public Relations of the Medical Society of the State of New York.

It was moved and carried that these Amendments be approved, subject to the approval of the Council of the Medical Society of the State of New York

The following candidates were elected to membership Goodlatte B Gilmore, Sidney J Karash, Joseph S Leibo, Solomon Reich, Eli H Rubin, Louis Ariel Schultz

Annual Reports for the year 1927 were sub-

mitted as follows

Secretary, Dr Landsman, Comitia Minora, Treasurer, Dr Keller, Censors, Dr Smiley, Secretary, Counsel, Mr McChristie, Committee on Membership, Dr Bookman, Chairman, Committee on Public Health and Medical Education, Dr Boas, Chairman, Committee on Medical Economics, Dr Lukin, Chairman, Committee on

Audit, Dr David A Newman, Chairman, Milk Commission, Dr Hinz, Chairman, Committee on Legislation, Dr Cunniffe, Chairman, Committee on Hospitals, Dr Goldberger, Chairman, Special Committee on New Members, Dr Shiffman, Chairman, Relief Committee, Dr Henry Roth, Chairman, Social Committee, Dr Weitzner, Chairman

The following officers were elected for the year 1928

President, Samuel Gitlow, First Vice-President, Harry Aranow, Second Vice-President, Joseph H Gettinger, Secretary, I J Landsman, Treasurer, J Adlai Keller, Board of Censors, Milton R Bookman, Benjamin Sherwin, Delegates, Harry Aranow, Louis A Friedman, J Adlai Keller, Edward C Podvin, Alternates, Benjamin Diamond, Moses H Krakow, Louis Nagorsky, Samuel Rosenzweig

Members of the Nominating Committee for 1928 were also elected as follows William Lenetska, Sydney Steiner, David A Newman, Harry Shiffman, Charles S Rogers, Charles H Hochman, William Klein, Sidney Cohn, Alexander Goldman, Morris Cohen and Norman Strauss

The Program proceeded as follows

1 Moving Picture—"How Biological Products Are Made," John H Schriever, Esq

2 "Health Conditions in the Bronx A Brief Resume of the Vital Statistics of the Borough," Godias J Drolet, Esq, of the Bronx Tuberculosis and Health Committee.

I J Landsman, Secretary

MONROE COUNTY

At the annual meeting of the Medical Society of the County of Monroe on December 20, 1927, officers were elected for the year 1928, as follows

President, Dr Cyril Sumner Vice-President, Charles G Lenhart Secretary, Dr J P Henry Treasurer, Dr W H Veeder

Censors Dr F S Winslow, Dr J M Flynn, Dr A S Miller, Dr A G Morris, Dr Warren Wooden

Delegates for Two Years Dr F S Winslow, Dr J P Henry, Dr W H Veeder

Alternates for Two Years Dr B J Slater, Dr E G Whipple, Dr H J Mann

Milk Commission Dr Paul W Beaven, Dr C L Hincher, Dr John Aikman

New members admitted Dr Raphael Farber, Dr J M Markin, Dr M E Missel, Dr H F Rowley, Dr K. K. Slaght, Dr J S Staneslow

The paper of the evening was the presidential address of the retiring president, Dr Warren Wooden, on "The Disease Factor in Civilization" Dr Wooden gave a most unusual and interesting talk on ancient civilizations and the

effect thereon of epidemic disease, illustrating his paper with excellent slides. The address was very greatly enjoyed by all present, as it represented quite a departure from the conventional type of paper presented at the usual medical meeting I P Henry, Secretary

HERKIMER COUNTY

The 121st annual meeting of the Medical Society of the County of Herkimer was held in the Men's Club of the Episcopal Church in Herkimer on Tuesday afternoon, December 6, 1927

About twenty physicians from different sections of the county were present. Reports were rendered by the various committees and officers and the following officers were elected for the ensuing year.

President, Dr F H Moore of Herkimer First Vice-President, Dr J L Crofts of Newport

Second Vice-President, Dr V M Parkinson

of Salisbury

Third Vice-President, Dr H C Murray of Herkimer

Secretary, Dr W B Brooks of Mohawk Treasurer, Dr A L Fagan of Herkimer

Librarian, Dr C J Diss of Ilion Censors, Drs L P Jones and C C Whittemore of Ilion, H J Sheffield and B J Kelly of Frankfort, and H H Williams of Mohawk

Delegate to the Fifth District Branch, Dr H H Halliwell of Ilion Alternate, Dr A

B Santry of Little Falls

Delegate to Medical Society of the State of New York, Dr F C Sabin, retiring president Alternate, Dr F H Moore, president-elect

Dr F C Sabin of Little Falls, the retiring president, gave his anniversary address in which he said in part

"During the past year we have lost three valuable members through death, William B Earl, Little Falls, W H Waterbury, Dolgeville and Edgar Swift, Jordanville

"To compensate for our losses we have gained four new members, Dr Dayton Griffith, Dolgeville, Dr Gallo, Herkimer, Dr O H Love, Little Falls, and Dr Smith, Jordanville

"The work of the Committee on the County fee bill has had little success so far This is through no mistake or lack of work on its part Last spring the Board of Supervisors, without consulting our committee, accepted a fee bill prepared by a committee from their board. This fee bill is not satisfactory to us and a unanimous vote at our September meeting directed our Secretary to so inform them and require their Committee to meet with ours and modify the fee bill in a satisfactory manner.

"The Committee on establishing a County Pathological Laboratory has held several meetings and has done considerable work. The Committee expects to meet with the Committee from the Board of Supervisors very soon and feels confident that some action will be taken before Christmas

"The only reason why we have not had favorable action before this is that some of our members have informed their Supervisors that a laboratory is not needed. I fail to see how any physician, who is endeavoring to practice present day medicine, can fail to see the benefits to be derived from a well equipped laboratory."

Dr Sabin gave his thanks to the Secretary, Dr Brooks and to the Chairman of the Program Committee, Dr F H Moore, for the excellent service they have rendered him in giving the membership such a successful administration. We have had excellent meetings, each with a splendid dinner and all well attended

In addition we have had a post-graduate course of lectures from the State Committee on Cardiology These were well announced by our Program Committee and largely attended and much interest was shown

Dr W D Garlock of Little Falls gave an interesting account of his two recent trips to Alaska

Dr C J Diss of Ilion gave case reports on Carcinoma of the Cervix and General Lympho Sarcoma

Dr H W Vickers of Little Falls led an able discussion which was participated in by many of those present

A motion was adopted to levy an assessment of \$3 for membership to help continue the active work of the Society, and at the same time a by-law was introduced adding this to our yearly dues after it is voted on at the next annual meeting. By unanimous vote in both instances the Society went on record as being completely in favor of the County Laboratory and the adoption of the new fee bill by the County Board of Supervisors. There was not a dissenting voice on either of these questions.

Following the Scientific Program the ladies of the Guild served an excellent chicken dinner at 6 p m during which the president-elect addressed the meeting and appointed the following committees to assist in carrying on the work for 1928

Program Committee Three Vice-Presidents, Dr J L Crofts, Chairman, Dr V M Parkinson and Dr H C Murray

Legislative Committee Dr F C Sabin.

Chairman, Dr Graves, Dr Sheffield, Dr Fagan, Dr Diss, Dr Santry, Dr Fairbanks and Dr Strobel

Public Health Committee Will be announced later and the Hospital Committee will be appointed after recommendation by the various hospital staffs

It was also intimated by the president-elect

that he was desirous of appointing a non-official cabinet with a member from each of the larger Communities to meet frequently during the year and assist in policies to be considered by the Society

The meeting adjourned at 8 p m
F H Moore,
Chairman Program Committee

GENESEE COUNTY

The regular fall meeting of the Genesee County Medical Association was held at the Holland Club, Batavia, N Y, on November 23, 1927 Several of our neighbors of the adjoining county of Wyoming were invited as our guests Dr Howard L Prince of Rochester, N Y, gave a very instructive talk on "Infections of the Hand as seen by the General Practitioner in his Office" He pointed out the necessity of early and adequate drainage of these common infections During the business session of the meeting the following resolutions were unanimously passed by the Society

Resolution 1 Resolved that "The Genesee County Medical Society commends the action of the Genesee County Public Health and Tuberculosis Association, Inc., in withdrawing from their affiliation with the New York State Charities Aid"

Resolution 2 Resolved that "The Genesee County Medical Society declares itself in accord with the action of the Cattaraugus County Medical Society in its controversy with the Milbank Fund"

After the meeting supper was served at the Richmond Hotel, Batavia, N Y
IRWIN A COLE, Sccretary

CHAUTAUQUA COUNTY MEDICAL SOCIETY

The annual meeting of the Chautauqua County Medical Society was held at the Hotel Jamestown, Jamestown, N Y, on December 14, 1927, beginning with the business session at 12 30 P M A dinner at 1 P M was followed by the Scientific Session

The following officers were elected for the year 1928

President, J F Foss, M D, Dunkirk
First Vice-President, B S Swetland, M D,
Brockton

Second Vice-President, F J McCulla, M D, Jamestown

Secretary, Edgar Bieber, M.D., Dunkirk Treasurer, C. E. Hallenbeck, M.D., Dunkirk Delegates to State Society, George W. Cottis, M.D., Jamestown, Edgar Bieber, M.D., Dunkirk

Scientific Session

"The Interdependence of the State and County Medical Societies" Dr Harry Trick of Buffalo, President-elect of the State Society

"The Subjective and Objective Evidences of Cardio-Vascular Disease" A brief outline of the principal conditions enumerated above Dr George J Eckel of Buffalo

EDGAR BIEBER, M.D., Secretary

OTSEGO COUNTY MEDICAL SOCIETY

The annual meeting was held in the Elks' Home on December 13, 1927

The Minutes of the semi-annual meeting

were read and approved

At his request, a transfer was granted to Dr A H Bissell to the Medical Society at Bridge-port, Conn

Drs Cruttenden, Atwell and Greenough were appointed a committee to draw up suitable resolutions in regard to the death of Dr

Hovle They submitted the following

The members of the Otsego County Medical Society at their regular meeting held on December 13, 1927, desire to place on its records the esteem and respect they hold for the memory of Dr J P Hoyle, for many years a mem-

ber of the society, and to express their deep sympathy to his family It is further directed that a copy of this resolution be sent to his family and given to the press

Signed by the above committee

Dr Ford presented the report of the nominating committee and on motion the names as read were declared elected as our officers for 1928

President, Dr F J Atwell of Cooperstown Vice-President, Dr D H Mills of Oneonta Treasurer, Dr F L Winsor of Laurens Secretary, Dr A H Brownell of Oneonta Censor, Dr E C Winsor of Schenevus Delegate and alternate to the State Conven-

tion. Drs L C Warren of Franklin and Dr R W Ford of Otego

Drs E C Winsor, Mills and Brownell were appointed as a committee to secure new members for the society

A committee to arrange program for all meetings of the year will later be appointed

by the President

Dr J C Smith presented the report of the Committee for revision of the By-Laws After reading and some minor changes they were adopted subject to the approval of the State Society

Dr Fred M Johnson of Cooperstown was

elected as a member of the society

After the dinner Dr J S Lawrence of the State Legislative Committee presented a series of recommendations for the society to act upon during the coming year

Dr C Winfield Nye of New York gave an illustrated lecture on Traumatic Lesions of the nervous system and Inter-Cranial Pres-A lecture full of new methods of diagnosis and treatment of such conditions that were most helpful

Besides the visitors, Dr Lawrence and Dr Nye, there were present Dr F E Bolt of Worcester, Dr E C Winsor of Schenevus. Dr F L Winsor of Laurens, Dr B W Phillips of Milford, Dr R W Ford of Otsego, Dr L C Warren of Franklin, Dr B S Stearns of Unadilla, Drs Cruttenden, Atwell, Johnson, Tyron, Greenough of Cooperstown, Drs Marx, Mills, House, Cooke, Parish, Hendrick, Dart, Champlin, Smith, Monahan, Getman, Carson and Brownell of Oneonta

A H BROWNELL, Secretary

CATTARAUGUS COUNTY

A news item sent the newspapers by the State Charities Aid Association on December 20th, has the following announcement regarding Cattarau-

gus County

"At the request of the County Board of Health and 37 other public bodies and civic and welfare organizations in the county, and notwithstanding the opposition of the Cattaraugus County Medical Society, the Milbank Memorial Fund of New York will continue its participation in the Cattaraugus County Health Demonstration, a public health program which has evoked national and international interest The Fund announced today that its Directors had unanimously appropriated \$87,338 20 toward the expenses of the health program in Cattaraugus County during the coming

"This appropriation by the Fund followed the recent action of the Board of Supervisors of Cattaraugus County renewing its appropriation of \$56,000 to the County Board of Health for 1928 The Milbank grant is shared by the Board of Health, the County School Hygiene Service and

the County Health Association

"An alternative and greatly reduced plan of health activities proposed by the Cattaraugus County Medical Society, calling for an appropriation of only \$36,000 and for the appointment of five of the seven members of the County Board of Health from a list of physicians to be submitted by the County Medical Society failed of approval by the Board of Supervisors physician, making a total of three, was appointed to the Board of Health, and the new medical member was not chosen by the Board of Super visors from a list submitted by the County Medi-

cal Society

"Recent statements by the County Medical Society that the Health Demonstration was likely to be transferred to some other county were without foundation, it was announced today by the State Charities Aid Association, the Agent of the Milbank Memorial Fund At no time has the removal of the Demonstration to another county been discussed or considered, it was said by the Association

"The continuance of the participation by the Fund in the health demonstration was recommended by the State Charities Aid Association, and approved by the Board of technical experts of the Milbank Memorial Fund, following a conference between this board, the chairman of the county board of supervisors, Victor R. Lynde of Delevan, and the chairman of the County Board of Health, John Walrath of Salamanca

"The Cattaraugus County Health Demonstration was begun in 1923 for a period of at least five years Its organization and work have attracted nationwide attention among health experts and elicited inquiries and attracted visitors from many foreign countries An analysis of the results, showing an outstanding reduction in the tuberculosis death rate and a striking decline in infant mortality, prepared by Edgar Syden-stricker, Statistician for the U S Public Health Service, has successfully passed the critical examination of an Advisory Statistical Committee of the foremost statisticians in the country"

DR JAMES P BRADY

Dr James P Brady of Rochester died on December 27, 1927, aged 63 years He was past-president of the Monroe County Society and of the Rochester Academy of Medicine, a long-time member of the Comitia Minora of the County Society and a member of the last

and also of the present House of Delegates He was one of the best known and most beloved in the profession in Rochester His kindly, genial personality, his wit and his professional ability will long be remembered J P HENRY, Secretary

KINGS COUNTY

The stated meeting of the Kings County Medical Society on December 20, 1927, brought to a close an active year The election of officers for the ensuing year occupied the time of the members before the scientific session Those elected were—President, Charles H Goodrich, Vice-President, Thomas M Brennan, Secretary, James Steele, Associate Secretary, Joseph Raphael, Treasurer, John L Bauer, Associate Treasurer, Ruth Ingraham, Directing Librarian, Jacques C Rushmore, Associate Directing Librarian and Curator, Frank L Babbott, Jr, Trustees, Henry Joachum, Thurston S Welton, John J Masterson, Censors, Samuel Lloyd Fisher, Milton G Wasch, Henry F Bruning, Delegates to the State Society, Robert F Barber, Elias H Bartley, Walter D Ludlum, William A Jewett, Charles H Goodrich, John E Jennings, John L Bauer, Joseph W Malone, Thomas M Brennan, O Paul Humpstone, Cameron Duncan

President Thurston S Welton had arranged a scientific program illustrated throughout with motion pictures showing the heart action in many phases Simon Frucht, MD of Brooklyn, described briefly and concurrently with three reels of animated cartoons, the circulation, the mechanical structure of the heart, the chambers contracting and dilating, and the valves opening and closing, the heart rhythm, the spread of the excitation wave, the prema-

ture contraction, paroxysmal tachycardia, heart block, and auricular flutter and fibrillation

The second speaker, Robert Hurtin Halsey, M D of Manhattan, presented a reel illustrating the action of the valves of the heart. A view of the interior of the heart chambers of a bull was obtained by inserting glass windows whereby the valve leaflets were watched. The heart action was imitated by introducing fluid into the ventricles causing the mitral leaflets to flap together under the eye of the camera.

Samuel W Lambert, MD of Manhattan, exhibited two reels demonstrating heart block in the turtle and the dog By a different method of demonstration, he photographed the heart in situ in the living animal as it beat normally, and then after instilling pilocarpine, producing heart block The progressive degrees of heart block were shown by The auricles means of slow-motion pictures and ventricles could be seen contracting alternately and rhythmically until the block was Thereafter the auricles beat twice to the ventricle's once, then three times, and progressively the action became totally irregular, the auricles fibrillated, and finally ceased to contract

The attendance was over five hundred and a double line of those standing encircled the filled seats of the auditorium

JEFFERSON COUNTY

A regular meeting of the Jefferson County Medical Society was held late in the afternoon and the evening of December 15th, at the Jeffer-

son County Golf Club

The first item of the program was the presentation of about a dozen patients showing interstitial keratitis and other evidences of congenital syphilis by Dr Walter S Atkinson Then came a dinner at seven o'clock, which was followed by the scientific session

Dr Walter F Smith of Watertown gave an address on the symptoms of congenital syphilis

Dr William N Maloney of Cape Vincent read a paper on the problems of rural practise

It was voted that the Society continue one subscription of "Hygeia" for the Flower Memorial Hospital

The Society endorsed the Children's Health Camp for undernourished children which is held each summer

A committee to arrange for children's health consultations throughout the country was appointed, consisting of Dr C W Bullard of Black River, Chairman, Dr E A Simonds of Carthage, and Dr C J Severance of Mannsville

WAITER P ATKINSON, Secretary

MEDICAL WARES

THE X-RAY MACHINE

The X-rays were so named because their nature could not be explained for over a decade after their discovery by W K Roentgen in 1895. But research into the nature of radium, electricity, ethereal vibrations, and the atom has explained many points which were long mysterious, and has enabled manufacturers to construct machines which will produce the X-ray in exact amounts and of known properties. Yet the common name is still retained because it is a simple term whose meaning is well known and exact.

The X-rays are vibrations similar to those of light, and differing from them principally in their wave lengths. The accepted measurement of wave length is the Angstrom unit, which is one ten-millionth of a millimeter Visible light has a wave length varying from 7700 Angstrom units for the red rays to 3900 for the violet. The X-rays have a wave length of from one-half to one-twelfth of an Angstrom unit, which is somewhat longer than that of the gamma ray emitted by radium.

The properties of the X-rays which are applied in medicine are the result of the shortness of their wave length Scientists now consider matter to be extremely porous with its material particles separated by spaces thousands of times larger than the sizes of the atoms or their components, the positive and negative electrons The X-rays penetrate matter because their waves are extremely small and can pass deeply into an object before they collide with a particle of matter A wave of ordinary light is larger than the spaces be tween the electrons of matter, and so it cannot penetrate into most substances at all. but it dissipates its action on the surface ary light produces a burning effect on the surface cells only, while the X-rays produce similar effects on the tissues which they reach deep in the interior of the body But even the X-rays finally collide with material particles in the tissues, and so their penetration is limited

The X-rays are phenomena of what are called cathode rays When a high voltage current of electricity is passed through a vacuum, cathode rays are produced at the negative pole or cathode These rays produce X-rays when they strike the glass of a tube or other solid object, but they may be focused upon an object, and when they are focused upon the positive pole, or target, they produce the X-rays in great amounts

The practical generation of X-rays requires current of very high voltage to be passed through the X-ray tube in only one direction As it is impracticable to generate and use a direct current of very high voltage, it is necessary to use alternating current which is rectified after it is stepped-up to the required high voltage

To a moderate extent, the present-day Xray tube of the hot cathode type rectifies its own current by preventing passage of one wave of the alternating current, but for greater power, the current necessarily must be rectified before it is applied to the X-ray tube For many years, a mechanical device consisting of synchronous motor and rotating switch was used, but modern practice tends towards the use of Kenex (valve tube) rectification introduced into the high tension circuit This tube consists of a hot filament cathode and an anode enclosed within a high vacuum glass bulb, the device looking like a small X-ray tube Negative electrons are emitted from the hot filament During one wave or half cycle, all the alternating current electrons emitted from the hot filament cathode are driven to the anode and current flows from anode to cathode During the other wave or half cycle in the opposite direction, during which the filament becomes positive, the emitted electrons are returned to it, and there is then consequently no current By this means, even though alternating current is generated in the transformer windings, the X-ray tube receives a series of uni-directional impulses

The wave length of the X-rays depends upon the voltage of the electric current which produces them. The higher the voltage, the shorter the wave length and the more deeply will the X-rays penetrate into the tissues before they are absorbed or dissipated. A ray of short wave length is called a hard ray, and will penetrate deeply, while one of a longer wave length is called a soft ray, and will penetrate less deeply. A hard ray cannot be used in photographing thin tissues because it passes through them almost as readily as light through ordinary glass. Modern X-ray machines are made in types adapted to their requirements, one type for photographing (radiography) and fluoroscopy, another for deep therapy

The voltages produced by X-ray machines vary from 30,000 for soft rays to over 200,000 for the hard rays. The limit of voltage is that which the tube can stand. Machines to produce a million volts could be built readily, but tubes cannot be

made to stand much over 200,000 volts without breaking

The voltage of the older machines was deternuned by the distance that a spark would jump between terminals of the machine older tubes gave off a greenish glow which was the luminescence of the gas in the tube had devices for liberating exceedingly small amounts of gas by heating asbestos with a gas flame or an electric current, and the operator judged the softness or hardness of the tube partly by the brightness of its glow, and also by the distance which a spark would jump across a gap paralleling the path of the current through the X-ray tube A doctor prescribed the dosage of X-rays by specifying the length of the parallel spark gap, and the number of milliamperes of current passing through the tube

The hardness or softness of the X-ray tube is determined by the voltage impressed upon it, which is indicated on a voltmeter. Alternating current from the mains or other source of supply is passed into an "auto-transformer" which provides a means for varying the voltage of the current actually delivered to the primary of the step-up transformer The voltage obtained from the secondary windings of the step-up transformer depends upon the ratio between the number of turns in a primary winding and those in the secondary winding For example, if the ratio is 1 to 500, the secondary voltage would be 500 times that of the primary voltage As the voltage delivered to the primary may be varied by as little as one volt for each step through a large number of steps, the secondary voltage will consequently be capable of a large range of ad-These in turn result in differing degrees of hardness or penetrability of the resultant X-rays

The quantity of X-rays produced depends upon the miliamperes of electric current which flows from the anode to the cathode. The greater the miliamperage, the greater will be the quantity of X-rays. From 4 to 8 miliamperes are used for viewing tissues with the fluoroscope, from 4 to 20 for treatment; and from 10 to 100 for photographing tissues. The miliamperes are also indicated on a dial attached to the X-ray machine.

Whilst older X-ray tubes depended upon gas particles to form a path for the high voltage current, modern tubes exclude all possible gas and aim at a perfect vacuum. They operate on a different principle, employing a hot cathode which emits negative electrons in greater or lesser volume according to the heat of the cathode. Thus the control of milhamperes is effected by the regulation of the heating current through the hot cathode filament.

A number of substances give off visible light, or fluorescence, when X-rays fall upon them This principle is applied in the fluoroscopic screen,

which is coated with a highly fluorescent substance such as platino-barium cyanide, or calcium tungstite. The X-rays, striking the screen, cause it to glow with a light whose quantity is in direct proportion to the amount of X-rays falling upon each part of it. A tissue, viewed with a fluoroscope, appears outlined upon the screen

An intensifier used in X-ray photography consists of a fluorescent screen placed against the photographic plate. Since the screen acts by means of visible rays which will not penetrate a paper wrapping, the screen must be placed in direct contact with the emulsion side of the plate. A doctor who fails to remove the paper wrapping from the photographic plate or film will not get any results from the use of an intensifying screen. The maximum actinic effect is obtained when two intensifying screens are used in contact with both emulsions.

Modern X-ray emulsions are placed upon celluloid films instead of glass plates, and both sides of the film are coated so as to double the action of the X-rays An intensifying screen further increases the action of the X-rays from two to four times

Metals do not permit X-rays to pass through them readily Lead is the least permeable of the common metals because of the greater number and size of its atoms compared with those of other metals Lead plates and sheets are therefore used in treatments to cover the parts from which the rays are to be excluded

Sheets of aluminum of varying thickness are used to filter out the softer rays and to permit only the harder rays to pass. Their use permits the operator to regulate the dosage of X-rays that are applied to a part of the body.

The quantity of X-rays applied to the skin in therapeutics is prescribed in erythema units, one of which is the quantity of X-rays that will produce a reddening of the skin A small amount applied for a long time will produce the same effect as a larger amount used for a shorter time The skin tolerance is therefore stated in both the amount and time of application of the rays must be determined for each individual patient The method of finding the erythema dose is to cover an area of skin with sheet lead and move it across the area so as to uncover successive areas about every half minute. If the sheet is moved in six stages, the first area will be exposed three minutes, and the last one, half a minute A reddening of the area will occur in about a week. and the dosage exposure applied to the area that shows only a beginning redness is the erythema dose of that patient.

The exact applications of X-rays of known power are now possible because of the careful standardization and calibration of the generating machines by the manufacturer

THE DAILY PRESS

HEALTH SUPERSTITIONS

The editorial page of the December 19th issue of the New York Times, prints the following sage remarks about health superstitions

"Science will have a deal of general schooling to do before people give up carrying potatoes in pockets for rheumatism, wearing amber beads for goiters, and putting spider webs on deep cuts. There is a solid comfort in old superstitions, and medicine will have to prove its case well before it completely ousts them."

The occasion for these remarks was a fine imposed on a person by a Judge in Pottstown, Pennsylvania, for "Telling a State policeman of a magical method of curing insomnia. He was advised to put a pinch of salt in his shoes and also in his bed in the form of a cross. Technically,

this misdemeanor was classed as a violation of the Fortune Telling act of 1861. On appeal the decision was reversed, and the 'faith healer' was allowed to go free. The presiding Justice said that such conjuring might be 'foolish,' but it wasn't illegal"

Some New York State Judges have held that when a person consults a quack, knowing that the person is a quack, he does so at his own risk, and the quack is immune. But the trouble with that reasoning is that there is an element of credulity in all persons, including the educated and the Judges, and the quacks count on this element of human nature for their own profit. While a Judge, hearing a case involving credulity may consider it a joking affair, yet it is serious for the victim.

THE MEDICAL PRACTICE ACT

The report of the State Department of Education regarding the effects of the Medical Practice Act is encouraging not only to physicians but also to laymen. It takes time to set up the machinery for the enforcement of a new law, but the State Department of Education and the Attorney General have produced commendable results during the year in which the law has been actively enforced. The statement of the State Board of Medical Examiners was criticized for saying that five thousand persons were engaged in the illegal practice of medicine in New York State, but its report shows that the figures were probably correct.

The report of the Board has received the commendation of the New York *Herald Tribune*, of December 14, which published the following editorial

"A rather small actual catch of quack doctors and the like has followed the enactment last year of the Webb-Loomis bill strengthening the medical practice act by a registration requirement and in other ways. Thirty illegal practitioners have been convicted. Fifty-eight cases await decision. It is a moderate haul, but that is not the whole story. Dr. Harold Rypins, secretary of the State Board.

of Medical Examiners, reckons that a thousand quacks, and possibly more, have quit practice in New York State in the last year. That is about one-fourth of the number estimated to have been operating when the Webb-Loomis bill was passed. From Pennsylvania, New Jersey and Canada, have come bitter complaints of the migration of New York charlatans to new hunting grounds. Dr. Rypins's report of New York City's riddance is most encouraging, the clean-up here, on the surface, being almost complete.

"The whole crew of make-believe doctors, the clutter of pseudo-medical cults, is deprived of a winning trick now that its members cannot pose as doctors. The unauthorized use of that title has been practically discontinued, the inspectors find. Patients are protected, as they were not formerly, against a gross deception. They are at least forewarned that the panacea dealer or fantastic specialist whom they consult is not a licensed physician.

"Like the Baumes laws, the Webb-Loomis law is legislation of real deterrent force, judging from the account of its working by an official who has studied its effects at first hand"

LIFE'S SPAN

Shakespeare's thoughts on living in deeds, not years, has its counterpart in an editorial in the New York Times of December 10, based on

a report of President Kingsley, of the New York Life Insurance Company The President comments on the fact that the prolongation of life has been in the most productive years of life, and the result has been a great addition to the word's store of ability and productiveness. The editorial says

"By another measurement than that of years, this authority in lengthening the economic lite of man has reached the conclusion that the average man probably lives twice as long as his ancestors did a generation ago, and five times as long as those of two centuries earlier. Survivors at 57 have done from two to five times the work and had from two to five times the experiences and joys of their not far distant progenitors who reached that age. And "we must learn to live still faster" within the bounds of earthly existence. "We must achieve more" Life has in these terms been lengthened to from 120 to 300 years. By further development of brain power

it is conceivable that the 100, 200 or 300 years may be lengthened to 1,000 years

"Man will become the superman in the full achievement of what is inherent in him. Enabling him to live through the natural years of the body by teaching him the laws of hygiene and by warding off disease is the high office of helping him to live a thousand years in threescore and ten."

Regarding the centuries of age reached by Methuselah and his contemporaries, the Rev Dr Cadman offers the explanation that their years were moon years, according to the custom of measuring time among the ancient people of the east. If this method were applied to Methuselah, he lived seventy-five sun years, and he does not seem to have done anything particularly commendable, either

MOVING PICTURE TEACHING

A person does not really understand a fact unless he can visualize it, and see it plainly as a concrete picture. When he talks about Pekin, a map of China appears clear before him, and when he talks of death rates, a table of figures outline themselves in his mental vision.

Man must have something tangible with which to express even his mental abstractions. Herein is the peculiar field of usefulness of the moving picture. The New York *Herald Tribune* of December 19, carries an editorial called "Celluloid Imagination," saying

"The great physicist, Michael Faraday, considered the greatest experimenter of scientific his-

tory, was felt by his contemporaries to owe his pre-eminence to an unusual power of seeing in his mind's eye just what invisible things were like. His well known visualizing device of the magnetic "lines of force" has been one of the chief assistants to subsequent engineers in developing dynamos and motors. Few persons, even among scientists, possess this visualizing genius. Descriptions and formulas help little, and the objects themselves are invisible. The motion picture device of animation, used originally for the animated cartoons, has proved an important help. By its means it is possible actually to see the electric or magnetic forces in place and in action, just as the best modern opinion conceives them."

DEADLY RED TAPE

The New York newspapers have featured the death of a prominent financier because the police of a village three miles from the accident refused to send a public ambulance on the ground that the patient was in another county. The New York Herald-Tribune of January 9 quotes one of the policemen as saying

"The Board of Supervisors of the village had issued specific instructions that the ambulance was to remain within the village limits and he could not disobey this order. His police, he said, had no right to go into the jurisdiction of Nassau County."

The Fire Departments furnish abundance of

precedents that the attitude of the police regarding the ambulance was entirely wrong Every village has fire engines, and an ordinance forbidding their use outside of the village limits. Yet where fire occurs in a neighboring community, the firemen take the apparatus there and use it, and the village officials and the public support the firemen in their disregard of red tape.

When an emergency arises, a doctor knows no boundary lines of village or counties, no rank of money or fame, and no times or seasons of office hours, and no awe of flaming red tape

BOOK REVIEWS

DIAGNOSIS AND TREATMENT OF DISEASES OF THE STOM-With an Introduction to Practical Gastro-Enterology By MARTIN E REHFUSS, M.D. Octavo of 1236 pages, illustrated Philadelphia and London, W. B. Saunders Company, 1927 Cloth, \$1200

This is the first edition of a volume on diseases of the stomach which promises to meet with general ap-The book is divided into three parts, the first devoted to anatomy, embryology, physiology, and laboratory work. The author, who has contributed a great deal to the study of gastric chemistry in relation to various foods digested, discusses at length this phase of laboratory work Attention is called to the importance of history taking, and the practical considerations of gastric findings are analyzed. It is pleasing to note that special stress upon Fluroscopic and X-ray examination is made by the author calling particular attention to the important part that the gastroenterologist should play in this study Knowing the clinical symptom complex history and constitution of the individual, the stomach specialist if well trained is in the best position to interpret Fluroscopic and X-ray findings The first part of the book is concluded with a chapter on Gastroscopy by Chevalier Jackson

The second part of the book is given over to a full discussion of diseases and affections of the stomach with a thorough consideration of symptoms, diagnosis and

treatment.

In the third part of the book there is complete consideration of the relationship between the stomach and diseases of the esophagus, duodenum, liver, gall bladder, pancreas and intestines. The stomach and its relation to precordial pain, endocrine functions, disorders of the nervous system and kidney, is also considered Surgery of the stomach and the medical treatment of post-operative gastric conditions are well taken up. This exhaustive volume on gastric diseases is concluded with a chapter on medical treatment, dietary considerations, and instructive charts used in the treatment of gastric diseases

There will undoubtedly be many editions of this work, for a great deal of the old and useless has been omitted, and the important and recent advances are included so that it furnishes to the general practitioner a useful reference, and to the specialist a volume that he cannot do

without.

SURGERY. ITS PRINCIPLES AND PRACTICE. For Students and Practitioners By ASTLEY PASTON COOPER ASH-HURST, A.B., M.D. 3rd Edition, revised. Octavo of 1179 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$10.00

This single volume of 1179 pages with 15 colored plates and 1046 illustrations appears in its third edition

The work was written to furnish a foundation on which the knowledge of surgery is to be built. The book deals especially with the pathogenesis, diagnosis, and indications for treatment of the general surgical conditions. At least one of the accepted methods of doing the more important operative procedures is described in detail. The surgical specialties are omitted, except as they have some bearing on the general surgical problems under discussion

In this third edition 100 new illustrations and two colored plates have been added. The subject matter has been brought entirely up to date. The following sections have been rewritten or introduced as new matter, alkalosis, septicemia, tularemia, blastomy cosis, sporotrichosis, granuloma inguinale, treatment of anthrax, paraverte-bral and synergistic anesthesia, sciatica, fractures of the femur and of the leg and ankle, sarcoma of bone, treatment of hydrocephalus, hyperthyroidism, laryngectomy, surgery of the thymus, of pulmonary tubercu losis, and of bronchiectasis, massive collapse of the lung, chronic dilation of the duodenum visceroptosis congenital anomalies of rotation and fixation of the intestines, and carcinoma of the rectum

As a text book for the student of medicine or as a work of reference for the practitioner this book is sin MERRILL N FOOTE.

cerely recommended

DISEASES OF THE NEWBORN A Textbook for Students and Practitioners By JAMES BURNET, M.A., M.D. 12mo of 275 pages London and New York, Oxford University Press, 1927 Cloth, \$1 85 (Oxford Medi cal Publications)

In his preface the author states that "in teaching classes of medical students we have felt the want of a small work dealing with diseases of new-born infants" If, as we believe, that is the status of British pediatric literature we consider that the work is fairly well done.

The author has catalogued pretty thoroughly the conditions and diseases of the new-born and we think his judgment is good. At the same time we find very little which is not adequately covered in the American text books on general pediatrics

We disagree somewhat on treatment and consider that the student who is dependent solely on the therapeutic advice given in this volume will have difficulty in giving adequate treatment to his patients W D L

Manual of Diseases of the Eye for Students and General Practitioners By Charles H May, M.D 12th Edition, revised. 12mo of 445 pages, with 374 original illustrations New York, William Wood and Company, 1927 Cloth, \$400

It is a pleasure to welcome the twelfth edition of this work, so little in its form but so huge in its potentialities It is devised for students and practitioners and, in the conciseness of its style and accuracy of its illustrations and colored plates, it fulfills its role and design most thoroughly

With the issuance of frequent editions, it has kept well abreast of the advances of modern ophthalmology, a task too Herculean for the more ponderous text-books

on the subject.

IRVING GRAY

So one can but congratulate the author anew upon this new edition and commend it heartily to those for whom it and its predecessors have been written

E. C. PLACE.

GEORGE WM NORRIS, A.M., M.D., HENRY C. BAZETT, M.B., and THOMAS M. MCMILLAN, A.B., M.D. 4th Edition, revised. Octavo of 387 pages, illustrated Philadelphia, Lea and Febiger, 1927. Cloth, \$450 Blood-Pressure

Sphygmomanometry is almost universally practised in the United States today. Few are the patients, who have not had their blood pressure taken. Vast quantities of literature are published each year about blood pres-sure in connection with various diseases. The authors of this work review the literature from practically every of this work fevire the intrature from practically every possible angle. Indeed, at times one is overwhelmed with the "may be," "possible," and "probable" clauses in the book. The impression is given that much truth of value might have been placed in a small book, that would have been easily read, as the present book is certainly and contains data that are likely and the contains data that are likely and the state of the contains data that are likely are likely and the state of the contains data that the contains data the contains data that the contains data that the contains data that the contains data that the contains data the c tamly not easy to read, and contains data that really do not need to be included in a special book. The frontispiece is irrelevant, and is characteristic of the book in spots

The authors were not critical at times in the inclusion of data, which were obviously obtained when the emotional factor in increased blood pressure was in full

swing

Books on blood pressure have been fashionable during the last few years, but the value of books on symptoms are always debatable in value. They confuse symptoms and the really important, namely, the pathology back of the disease. The authors, and their adjuncts, cover this symptom so that anyone interested can find in the book all of the facts, and most of the theories on the subject J ARTHUR BUCHANAN

Physical Diagnosis By Richard C Cabor, M D 9th Edition, revised Octavo of 536 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$5 00

Practically no change in the plan and scope of this book has taken place in the nearly thirty years of its life but it has steadily grown in prestige and value to the Profession as it keeps pace with newer findings and facts proven at autopsy and reasonably established by deduction.

Dr Cabot builds upon the firm foundation of common sense and for that reason does not need to make anew his place among the teachers when some theory has been

found untenable.

The body in health and disease is his material and has always been and by constant work and careful thought he has discovered for his fellows and put into simple words the evidence which is of diagnostic import in the discussion of the various disturbances which physicians are called upon to consider

The book is convenient in size for hand or desk, is well printed and illustrated with but few errors in type and is the most ready reference text on the subject.

A Text-Book of Therapeutics Including the Essentials of Pharmacology and Materia Medica. By A. A. Stevens, A.M., M.D. 7th Edition, reset. Octavo of 758 pages. Philadelphia and London, W. B. Saunders Company, 1927. Cloth, \$6.50

In this edition the official preparations have been made to conform with those of the Tenth Revision of the US Pharmacopæia of 1926 The various new drugs have been added. In the first portion of the book there is a general description of the composition, preparations, incompatibilities and methods of administering drugs Each drug is grouped according to its pharmacologic action, and the various remedial measures other than drugs are described.

In the section on Applied Therapeutics the treatment of the different diseases is discussed in a manner in keeping with the standard character of the work

W. E. McCollom

FISTULA OF THE ANUS AND RECTUM BY CHARLES JOHN DRUECK, M D Octavo of 318 pages, with 66 illustrations Philadelphia, F A. Davis Company, 1927 Cloth, \$3.50

This book contains a thorough discussion of the etiology, diagnosis and treatment of anal and rectal fistula. The author emphasizes the need for the proper treatment of abscesses in the region of the anus to avoid subsequent fistulæ. He calls attention to the lack of immobilization in the treatment of infections about the anus.

The book is well-written and well printed, and the

illustrations are exceptionally clear

CHAPLES GOLDMAN

TUBERCULOSIS PULMOVAIRE TUBERCULOSE DES SÉREUSES Par le Docteur Pierre Pruvost. 12mo of 446 pages, il-lustrated. Paris, Gaston Dom & Cie, 1927 Boards, 30 Francs (Les Consultations Journalieres)

The vriter emphasizes the importance of being absolutely certain that the bacillus of Koch is actually the cause of the symptoms in the pathology of a given case. Ha mg eriablished that such is a fact, there are three elements to be considered in the treatment, first, the bacillus itself, secondly, the area of localization, and third, the resistance of the patient. Several errors may creep into the treatment of pulmonary tuberculosis, the first is doing nothing or doing too little, the second is in making the treatment too vigorous or too prolonged, and the third is that one may choose the wrong method of treatment for the individual case. Heliotherapy, says Pruvost, is an active treatment very useful in tubercu-losis of the bones, glands, and the serous membranes, but not suitable for pulmonary tuberculosis with an active focus Tuberculosis cannot, at the present time, be conquered by biological methods whether tuberculin, vaccine, or serum. The same is true of physical agents, such as high frequency currents, ultraviolet rays, and deep radiotherapy Pneumothorax is to be considered in three classes of cases, first, in rapidly advanced acute tuberculosis, second, in cases suddenly aggravated by a new focus of infection, and third, in cases of severe and serious hemophysis In tuberculosis of the peritoneum general measures of treatment are used, such as rest, fresh air, proper food, and the administration of adrenalin Heliotherapy is here the method of choice.

WM HENRY DONNELLY

POTASSIUM AND TARTRATES A Review of the Literature on Their Physiological Effects By RALPH W WEB-STER, Ph D, M D With a digest and bibliography of the literature by W A. Brennan, A.B 12mo of 168 pages Chicago The Commonwealth Press, 1927 pages Chi Cloth, \$250

This book of 168 pages is a comprehensive review of the physiological effects of Potassium and Tartrates that is interesting and instructive. It is a complete digest of the literature on these subjects

CANCER CONTROL. Report of an International Symposium Held under the Auspices of the American Society for the Control of Cancer, Lake Mohonk, New York, September 20-24, 1926 Octavo of 336 pages The Surgical Publishing Company of Chicago, 1927

This is a report of the International Symposium held at Lake Mohonk from September 20 to September 24, 1926, by the American Society for the Control of Cancer The volume contains the addresses of Soper and Welch given during the open session, and twenty-nine papers read during the executive sessions by eminent cancer specialists Certain important resolutions passed by the Symposium are also included This volume gives authoritative information on a subject that the laity are now intensely interested in and are demanding our views upon, not to speak of more productive action on our part. Even though no light is shed upon certain dark places, this publication gives a large amount of indispensable knowledge.

MEDICAL CLINICS OF NORTH AMERICA. Vol. 10, No 4
January, 1927 (New York Number) Published
every other month by the W B Saunders Company,
Philadelphia and London. Per Clinic Year (6 issues.) Cloth, \$1600 net, paper, \$1200 net.

The fourth number of the tenth volume of these series which appeared in January, 1927, is the New York Number and contains clinics and monographs by many clinicians and from many hospitals in the city. To pick out articles for special mention would be a task prompted by the individual taste of the reader or reviewer, and by the individual taste of the reader or reviewer, and the articles v hich v ould interest perhaps the majority of the general practitioners would be Anemia, by Dr I. W Held of Beth Israel Hospital, Treatment of Arthritis by Dr Blake F Donaldson of the New York Post-Graduate Hospital, Subacute Nephritis, by Drs Herman Mosenthal and Paul Klemperer, also of the Post-Graduate Medical School and Hospital. Another important article is The Recognition of Breath Sounds, by Dr George C. Ornstein from the Department of Tuberculosis of the Bellevie Hospital

WM HENRY DONNELLY

OUR NEIGHBORS

SALT IN MEDICINE

The uses of salt in medicine is the subject of the leading article in the December Journal of the Iowa State Medical Society, from which the

following quotations are taken

"The term salarium in Roman times meant an allowance of money to soldiers for salt Our own word salary there has its source Salt cakes have been used as money in Abyssinia and other parts of Africa and Tibet Its commercial importance was at one time so great that it is probable many of the ancient trade routes and highways were established very largely to transport As evidence of this, one of the oldest roads in Italy is called Via Salaria

"The world is plentifully supplied with salt It has been computed that the entire ocean if dried up could yield no less than four and onehalf million miles of rock salt, or about fourteen and one-half times the bulk of the entire continent of Europe above high water mark

"The manufacture and garnering of salt was once the work of Kings Kingdoms went to war over the possession of salt deposits. There were some salt springs on the banks of the river Saale in Frankia over which two countries fought for fifty years believing that such places are closer to heaven and prayers of mortals from them more easily heard

"For many years isotonic sodium chloride solution has been used to administer water by vein, beneath the skin and by bowel This physiologic solution has the same osmotic tension as the blood plasma and does not cause a destruction of the blood corpuscles The salt has been largely added to make the solution isotonic and not for any known inherent value possessed by the salt in the treatment of disease

"In recent years the attitude of many clinicians toward the importance of salt in certain abnormal conditions has caused a new chapter to be written in inorganic therapy. It is rapidly being realized that sodium chloride may be an important factor in disease and unless this salt is supplied in sufficient quantity serious consequences may be the result

"The use of saline solution in shock is well known in spite of the fact that recent studies have questioned its value In severe hemorrhage, toxemias, depletion, pre- and post-operative dehydration and exhaustive diseases of infancy its importance is recognized by all such conditions it has heretofore been considered that the salt plays a secondary role in that it serves as an aid to the introduction of water

and has not been given with the thought that it may have some inherent quality of worth in such therapy Some good reports of its use in

dementia precox have been received

"From the experimental standpoint the work of Loeb on the production of artificial parthenogenesis has been rather startling. He found that by immersing sea urchin eggs in sea water made hypertonic by adding sodium chloride the eggs were fertilized and developed normal larvæ when What a great replaced in normal sea water boost this would have been for salt if it had not been found that sucrose would do the same thing! The phenomenon was apparently brought about by a change in osmotic pressure and well serves to illustrate the effect that a change in physical chemistry may produce upon a living organism

'In the last few years considerable study has been made of the chlorides in their relation to certain diseases of the intestinal tract An obstruction of the pylorus, duodenum or jejunum will immediately initiate changes in the chemistry of the blood and urine, one of the most marked of which is the lowering of the sodium chloride content. This occurs in pronounced These tiny cases of congenital pyloric stenosis babies will sometimes have blood chlorides a Walters and little more than half the normal others have shown that changes in blood chemistry in duodenal fistula are similar to those found in obstructions of the upper bowel These changes also occur following experimental jejunostomy showing that drainage only of the up-

per small intestine produces toxemia

"The finding of lowered chlorides in intestinal obstruction has resulted in an adjunct treatment of this condition, the importance of which cannot be over-emphasized. Any patient ill with obstruction of the small intestine suffers from a combination of dehydration and toxemia accompanied by constant changes in chemistry indi-Not the cating destruction of protein tissue least important of these chemical changes is the marked drop in the blood chlorides with their almost complete disappearance from the urine Sodium chloride solution, if administered in sufficient quantity, not only relieves the dehydration but appears to have a direct action upon the reduction of toxemia. In other words, when sufficient salt is given, the products of protein destruction are diminished and the blood chemistry returns to or approaches the normal vidson has found almost identical changes in

The Battle Creek Super Solar Arc Lamp

For Heat, Light and Ultra-violet Therapy

THE new Battle Creek Super Solar Arc Lamp is unique in the field of Phototherapy appliances. It is the result of our own 40 years experience as pioneers in the production of therapeutic arc lamps in this country.

Many advanced features of construction make the new Battle Creek Super Solar Arc Lamp noteworthy A snap of the switch starts the arc burning at full power No time is lost in waiting for the rays to attain adequate intensity The lamp being automatically adjusted by magnetic feed, the largest arc possible with the given current is always maintained

A specially constructed adapter is furnished with the lamp It is designed so that the arc does not heat the applicators Any standard quartz applicator may be attached

By giving off rays in both the infra red and ultra violet the Super Solar Arc may be used to successfully treat a wide range of diseases. The technic of handling it is easily mastered. Various spectra are instantly obtainable by the use of different carbons.

We have recently prepared a new bulletin which describes fully the many advantages of the new Super Solar Arc Lamp May we send you a copy?

Battle Creek Therapeutic Appliances Include

Hydrotherapy Apparatus— Type G-3

The Battle Creek Hydrotherapy Apparatus is constructed through out of high quality brass The ap phance has wall type control and gives jet rain or shower perincal needle spray and Scotch douches

Electric Light Bath Cabinets

Three models varying in size and cost Each cabinet complete with special comfort chair and necessary bulbs Made of the finest hard wood water proof cemented veneer

The Battle Creek Radiant Baker

A tested appliance for heat application. The Baker is constructed of aluminum and asbestos and equipped with safety theostat to prevent excessive heating

The Battle Creek Treatment Photophore

A most efficient appliance for making local applications of heat. It combines the essentials of many expensive therapeutic lamps in one simple effective appliance (Continued from page 110)

severe superficial burns and has instituted salt therapy as part of his treatment

"There is no more logical therapeutic measure in the realm of medicine than the simple substitution in the body of a substance to replace that which has been lost or destroyed by disease. If the simple administration of sodium chloride in intestinal obstruction, burns, pneumonia and bichloride poisoning diminishes symptoms, reduces toxemia and gives the patient a weapon with which he may make a greater fight for life, it behooves every physician treating these conditions to familiarize himself with its importance

"If such diseased conditions as intestinal obstruction, pyloric obstruction, lobar pneumonia, burns, mercuric chloride poisoning and x-ray intoxication produce similar changes in the blood and urine chemistry, one of the most striking of which is decrease in the chlorides, is it not logical to believe that the toxemias are very similar and that function might, in a measure, be restored by similar treatment? In all of these diseases the administration of sodium chloride tends to prevent or reduce the changes in the blood chemistry

"We know that without salt there can be no life. The body maintains the sodium chloride content of the blood at a very even balance and any change in this balance may indicate a marked disturbance of function. A knowledge of the disturbed metabolism of sodium chloride serves to stimulate our interest in the inorganic compounds of the body in general and forces a realization that such constituents may be of inestimable importance in the study and treatment of disease."

RECIPES FOR COOKING LIVER

The good results of liver feeding in pernicious anemia have created a demand for various recipes for cooking the liver in order that a patient may take it day after day. The last issue of this Journal contained a number of recipes taken from the November issue of the *Illinois Medical Journal*. The following recipes were contributed to the December, 1927, issue of the *Atlantic Medical Journal* by Dr. C. R. Jones, of Pittsburgh, Pa

"The following recipes were prepared by the wife of a patient of Dr George L Hays, who is apparently skilled in the culinary art, and who is reported to have twice this number of methods of cooking liver. There is great need for skill in the preparation of this food, for there are a certain number of cases in which a distaste for liver arises.

"Vegetable Soup One quarter pound of liver will make two bowls of soup Grind the vege(Continued on page 114, adv xiv)

(Continued from page 113, adv xm)

tables—a heaping tablespoonful each of potato, carrot, celery, cabbage, and turnip, and a half tablespoonful of onion. All one large tomato or almost one-third can of tomatoes pressed through a sieve. Cover the liver with at least a pint of cold water and cook almost ten minutes. Add the vegetables and cook until they are well done.

"Cream of Liver Soup Two cups of milk Flour and butter to make a cream dressing (about one small teaspoonful of butter and a heaping tea spoonful of flour) Add a heaping tablespoonful of minced or ground liver which has been cooked in a small quantity of water. Do not pour off the water, boil it down and add to the cream soup

"Minced Liver and Rice Brown the liver slightly in a little butter and then cook slowly for a few minutes with the pan covered Add the liver to the already hot cooked rice—about a sixth of a pound of liver to two-thirds of a cup of rice

"Liver and Bacon One small lean piece of bacon to a sixth of a pound of liver Fry the liver after the bacon It is very palatable sometimes to grind the bacon and liver together Make it into a cake and fry in a little butter Make flour or water gravy as preferred

"Liver and Omons One large onion or two small ones, parboiled so that it will not take so long to brown them Fry the bacon, set aside, and brown the onions in the bacon fat Use only one piece of bacon Set the onions and bacon aside where they will keep warm, then fry the liver in the fat that is left Sometimes it will be necessary to add a little butter

"Liver and Tomatoes Fry a sixth of a pound of liver either in pieces or ground Purée either two fresh tomatoes or one-third can of tomatoes Make a brown gravy after the liver is cooked, and add the tomatoes

"Baked Liver Either grind or cut in pieces a sixth of a pound of liver Cook in a small casserole with a small quantity of water and a small piece of butter for about fifteen minutes in a moderate oven This is very good if a tiny piece of garlic is added

"Liver Omelet Fry about a heaping tablespoonful or a little more minced liver for a few minutes in butter Beat one or two eggs until light, toss them about in hot water, then mix the liver through the eggs

"Stuffed Pepper Stuff a good-sized pepper with either raw or cooked liver mixed with bread, butter and seasoning Bake with water and butter

(Continued on page 115, adv xv)

(Continued from page 114, adv xiv)

"Stuffed Tomato Scoop out the tomato Mix this with minced or ground liver, a little minced onion, celery, bread, and a small piece of butter Season with sugar, salt, and pepper, and fill the tomato shell Bake about twenty minutes

"Broiled Liver A small thick slice can be broiled like steak Avoid cooking too much

"Liver Dumplings There is a German recipe which I cannot quote correctly, as my patient does not care for it. It is something like this ground liver, a little minced onions, bread, and a small quantity of baking powder. This is made into balls and dropped in hot broth

"Liver should not be fried too hard Cook to a light brown on both sides then cover the pan Cook long enough that it will not be rare, but do not cook too much

"A half-pound of liver is the amount prescribed for one day. Apportion it into three meals—or a sixth of a pound per meal. The patient is not restricted to a half-pound if more than that amount can be eaten in a day."

SCIENCE AND ART IN MEDICINE

There is both a science and an art in the practice of medicine, and most physicians combine the two The Rhode Island Medical Journal of December has the following editorial on the relation of the two forms of practice

"Life is a succession of choices, most of them compromises

"The young physician soon learns that he must strike a nice balance between what we may term 'quantity production' and fine craftsmanship. The difference is most clearly appreciated by regarding the methods of men who have chosen one or the other extreme

"The 'quantity' man sees as many patients a day as possible, giving but a few minutes to each and of necessity missing many points which a more extended consideration would develop, but undoubtedly giving relief in a majority of cases

"At the other end of the scale is the man who sees very few cases but puts much time into the study of each one and brings to bear all the laboratory facilities at his command. He spends much time in study

"Either method carried to extremes defeats the purpose of the physician to be of the greatest possible good to humanity. It is an awkward dilemma

"The man who wears himself out trying to keep pace with the multiplicity of new information leaves himself neither time nor energy to (Continued on page 116, adv xvi) Frank L. Hough, Director

apply that knowledge to the relief of suffering Neither is the average patient willing to spend either the time or money necessary for such in tensive study

"The over busy practitioner on the other hand quickly falls behind in his methods and has progressively less and less of value to give to the many patients he sees

"Somewhere between these two extremes must the great majority of physicians take their sta tion

"That man who most closely estimates his aptitudes and finds his proper place will do most for the good of all"

FUNCTIONS OF THE SKIN

The Journal of the American Medical Association of December 24th calls attention editorially to two important skin functions which have not hitherto been recognized, l, the anti-rachitic properties of the cholesterol, and 2, the storage of sugar The article says

"Biochemists have long appreciated the es sential fitness of the skin for covering and The skin and its approtecting the body pendages are composed largely of keratin, a protein characterized by its insolubility in all ordinary reagents and by its failure to exhibit the usual chemical reactions It thus is not only resistant physically but also highly mert chemically and seems strikingly well adapted to its function in the organism This very correlation of chemical nature and physiologic behavior is so obvious that students are likely to neglect further study of possible function of the skin The sweat glands and their activities early drew attention to the part these structures play in excretion, and for a long time this activity of the skin was considered as an important adjunct to the work of the kidneys This point of view is untenable, however, in the light of newer ex-The skin does play a significant periments part in temperature control through its ability to conduct heat and evaporate water

"Recent studies have redirected attention to the skin and emphasized the physiologic importance, heretofore unsuspected, of certain of its constituents The production of antirachitic properties in cholesterol by ultraviolet irradiation and the protection against rickets afforded by similar treatment of the skin are now well known. The possible rationale of such physical therapy has been provided by the chemical analysis of skin by Eckstein, who has shown that approximately

(Continued on page 117, adv xvn)

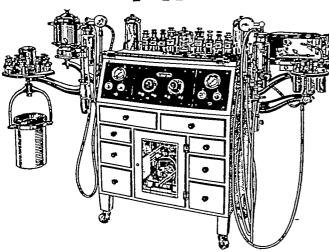

(Continued from page 116, adv xvi)

one fifth of the lipoid extracted from the human skin is present as free cholesterol. It seems reasonable to presume, therefore, that light treatment of the skin activates cholesterol in vivo. These implications, together with the efficacy of such treatment, indicates that the cholesterol of the skin is mobile and takes an active part in metabolism.

That the skin is also of importance as an organ of storage is indicated by recent experiments on laboratory animals Skelton has studied the part played by various tissues of the cat not only in donating water to the blood after hemorrhage but also in taking up fluid after injections of various salt solutions into the He found that, in cats which blood stream had been deprived of water for five days previous to the hemorrhage, the skin gave up about 40 per cent of the fluid—more than any Again, in animals other tissue examined with similar treatment before the experiment, the skin took up more fluid per gram than any other tissue and accounted for approximately 14 per cent of the water held by the body when examined thirty minutes after the injection of physiologic sodium chloride solu-Evidence of a similar type of activity has been brought forward by Folin, Trimble and Newman These investigators have introduced dextrose solutions into guinea-pigs and attempted to recover the injected sugar from the various body tissues. They have shown that thirty minutes after the dextrose solution has been given, the skin contains almost as much sugar as the blood. They point out further that, although this tissue is not a storage place for dextrose and glycogen, its significance as a temporary receptacle is greater than has thus far been realized. The possible role of the skin in carbohydrate metabolism is thus suggested by these analyses.

"The function of the skin as a protective tissue remains undisputed However, the capacity for storage and for mobilization of water and sugar and possibly other physiologic materials is one not thus far appreciated For a long time bone was considered as a stable, static, structural tissue with little metabolic significance, but in this case, also, our ideas have been radically altered On the other hand, the experimental results described may possibly be harmonized with the chemical and physiologic resistance of the skin if one recalls the fact that it consists of various layers and that the part important as a protective tissue may not be the same that is concerned with water and sugar mobilization"

HEALTH EXAMINATIONS AT A COUNTY FAIR

The December, 1927, Journal of the Medical Society of New Jersey contains the following description of periodic examinations made at the Atlantic County, N J, fair on September 14-17, 1927 Under the joint auspices of the Atlantic County Medical Society and the Public Health Committee of the County Fair Association The article says

'A staff of 3 or 4 physicians made examinations from 2-4 p.m on each of the four days of the Fair Assisting was a corps of five nurses provided by the County Red Cross Public Health Nursing Service and the Tuberculosis Committee with 1 or 2 non-nurse assistants in the his-

tory-taking room

"The examination cards issued by the Medical Society of New Jersey were used On the first day, 11 were examined, 8 women and 3 men, the second day, 16 included 9 women and 7 men, third day 20, of whom 12 were women and 8 men, fourth day 16 were examined, 9 women and 7 men, a total of 63, or 38 women and 25 men"

Defects were found in the following percentages of those examined

11 per cent Nasal 3 per cent Ear 2 per cent Eyes 25 per cent Mouth 16 per cent Pulmonary 25 per cent Heart 6 per cent Glands 4 per cent Abdominal

Some detect was found in nearly every person that was evamined

As to the results of the demonstration the article says

onstration the propaganda for periodic health examinations seems to be having some effect. It was far less difficult to obtain clients less difficult to obtain clients this year than three years ago. Of the (we examined, not more than 15 were personally solicited than 15 were personally solicited or persuaded, the remaining 48 or persuaded, and the 25 or 30 (a examined, conservative estimate)

Poland Water

is not merely a pure table or bottled water, but it is a valuable adjuvant in the treatment of many forms of kidney trouble on account of its bland diuretic properties

who could not be examined for lack of time, must have come voluntarily on learning of the examination through some one of the advertising mediums—movies, flyers or newspapers"

SUDDEN DEATH AMONG DOCTORS

Doctors do not like to take their own medicine and they exhibit the ordinary human fear when it comes to seeking medical advice for themselves and accepting unpleasant diagnoses. Periodical medical examinations will not become popular among people until the doctors submit themselves to the examinations and give heed to the findings.

The Wisconsin Medical Journal of December, 1927, has this to say about the need that physicians shall have physical examinations of their own bodies

"Every issue of our journal carries paragraphs such as the following

"Dr — died suddenly at his home on — Age 53

"Dr — died on June 30th while at work Age 53

"Dr — died suddenly on — Age 42

"Dr — died suddenly on September 10th at the home of a patient Age 50

"Dr — died on November 11th while on his way to the home of a patient Age 51

"At the end of the obituary notice will be found the usual statement, 'Surviving him are his wife and children'

"Physicians owe no less to their wives and children than men in other walks of life. At a time when the State Medical Society weekly is advising hundreds of thousands of laymen to have a periodic health examination, it is indeed the lax physician who does not follow his own prescription

"Are we scolding? We wonder if it isn't needed"

SYPHILIS—ITS RECOGNITION AND CARE FROM AN INDUSTRIAL STANDPOINT*

By WILLIAM LOW, MD, JOHNSON CITY, N Y.

PINIONS vary as to the origin of syphilis and the method by which it is carried Some say it was before the time of Christ and one might be led to understand some of the Kings of Bible times were afflicted Others suggest it was introduced to various parts of the world by the armies of Alexander It is possible the Legions of Cæsar and other Romans may have given impetus to its spread but McDonough seems to think Columbus brought it to Europe from Haiti and that the soldiers of Charles II of France spread it about Europe At any rate it was during the last of the fifteenth century that syphilis was identified as a separate disease (often called The French Disease) and treated as such

Fournier made no claims regarding its origin or its classification but it is known syphilis has followed the armies of the world and left its indelible mark on victor and vanquished alike and it has followed all avenues of commerce as is attested at the many seaports of the world and the various clinics at those points

Just now, however, we are more interested in this subject as it applies during peace amongst those engaged in industrial institutions and other peaceful pursuits Less than a decade back our own vast military organization was demobilized almost over night and that same army soon found itself absorbed by our vast industrial organizations. In other words the fighting army of one day became the working army of the next and we have learned from the lessons of this last war as applied to the selection of our soldiery that the same principals must be applied to the selection of workers in ındustry

History, marks on the body, clinical and other findings should be of use to the employer Conditions have been improved for the tubercular, the alcoholic and intemperate and their places in industry Syphilis will have to be considered in the same way

• Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls N Y, May 11, 1927

The Endicott-Johnson Corporation employs between 16,000 and 17,000 workers and it maintains a medical department second to none to care for their health and that of their dependents and it does this because it has found there is a definite relation between the health of its workers and productions

Whether it be the worker in the restaurant or some other position, health is important. If it be abraided skin on hands or feet he may get an infection. Slight infections or injuries frequently bring to light the more serious troubles. For instance. There was the case of a man working in concrete He fractured his spine three days after employment and worked a week after the injury His spinal injury was healed but he has been drawing compensation because of the luetic condition which the injury lighted up

Klauder (JA.M.A, April 8, 1922), in discussing the relations between syphilis and trauma from an industrial aspect, finds "That if a syphilitic workman while in the performance of his work sustains, under certain circumstances, an injury which causes any of the possible results of traumatized syphilitic tissue his employer is liable for compensation provided it can be shown that the injury came from and in the course of his employment"

It is because of many similar examples of the above condition that The Endicott-Johnson Corporation some years ago began a routine examination of all its employees before accepting them for employment. As Paul E Bowers "The captains of industry recognize that the health of the employee results in a

direct financial gain to them"

Let us again quote Paul E Bowers in Venereal Disease Information, U S Public Health Service, vol v, June, 1924 "It is not at all strange as matters of personal and public health are brought to the attention of society in general and the industrial world in particular that the attention of employers should begin to be focused upon the relationship that

venereal diseases, particularly syphilis, bears to lower industrial efficiency or, in other words, that there is a distinct relationship between syphilis and the production of dollars and cents" With us it may be said "And Shoes"

When sick relief and workmen's compensation are given liability to illness and accidents must be considered as well as quantity and quality of productions—also their causes, preventions and early return to the productive state. A trained worker must not be idle long for his absence will be noted and have a direct bearing upon others, their work and oftimes happiness especially if overtime is required to do the work of others.

When an industry takes its employees from 26 to 28 nationalities (the negro is the smallest in number) the various diseases peculiar to each race must be considered but we find that syphilis is no respecter of race, class, nation or industry. Since a healthy worker is an asset a pre-employment examination is made including an examination of urine and a blood Wasserman and other special examinations are made if need is indicated.

J R Williams (Am Journal Syphilis, April, 1921)—in 912 examinations of apparently healthy seekers of employment found approximately 4 4-10 per cent gave positive Wassermann reactions

William Alfred Sawyer and Benjamin J Slater, New York State Journal of Medicine, 1926, vol xxvi, p 697—Blood was taken from 3,447 individuals Between 3½ per cent and 4 per cent gave positive reactions

In our own offices during the past year we find that out of 4,117 premedical examinations of employees 3 7-10 per cent have shown positive Wassermann reaction

It has recently been said in Europe that fully 50 per cent of the tertiary syphilities give negative Wassermanns In that case we must give thought to other things in the examination

Dr Arthur Chittenden of Binghamton, N Y, once said "Look your patient in the eye, squarely in the eye for the pin-pointed pupil or one dilated and the other contracted will tell you a great deal" One does not need to be especially trained as a neurologist to be able to note how one to be examined stands, walks or talks The examiner will readily note a change from the usual

When this examination is made the results are soon seen whether he be a worker or one seeking employment. The educational value to a community is much. The worker who has been exposed readily presents himself for examination many times and seeks treatment if it be needed. The one not so sure of his past deeds seeks to know and wants treatment. Now and then a few will go elsewhere so their friends will be less apt to suspect their condi-

tion The seeker after employment realizes he must be in good health to get work and seeks examination in order that he may know previous to seeking employment

Dr C H Longstreet, Health Officer of Bing hamton, N Y, in charge of the Community Service Clinic says that many come to him for advice as they know if they have syphilis they have little chance of employment. They want to get well as they know their health is as important to their employer as to themselves

I have often seen those of the Armenian race secure a blood and physical examination before marriage. They no doubt place the same importance on the health of the family as the employer does on that of his employee.

Effects of syphilis in the first stage Very little inconvenience may occur to the worker during the primary stage so far as loss of time or quality of work is concerned unless it be due to worry about his condition if known. He is nevertheless a menace to his fellow workers and should be isolated from the rest in such a way that no careless infection may take place. In industry this is liable to occur in many ways aside from the usual secual transmission and that disease may be spread in apparently innocent ways. This percentage is not large but definite proof is available.

Two cases come to mind where the truth of the workers statements can be relied upon where infections (innocent) have occurred in cuts on the face and the original source of infection traced. Such being true it is not wise to permit the chance of infection even if it be somewhat remote. We have found it satisfactory where recognized—during the most active stage of the disease to put the infected worker on sick relief and treatment away from work in the factory until he is no longer a menace

During the second stage efficiency is somewhat reduced and this stage of the disease seems to be somewhat more common. One does not see the chancre stage as often as the text book would suggest. This may be due to the fact that it is thought lightly of and treatment is not sought due to ignorance, neglect, or the help of a would-be kind friend who treats something he is not so familiar with as he should be, or possibly due to the idea that a so called innocent sore has healed. Sometimes an active gonorrhea may also mask incipient syphilis.

Due to better knowledge most people will seek help especially if that help can easily be obtained and the cost is not prohibitive. Then too confidence in the source of health protection is important. Those of supposed limited knowledge are no longer satisfied with a bottle of medicine but insist upon modern methods of treatment or ask where it may be obtained. Here is a case that illustrates this point.

Slav was in a distant city and sought treatment when it was due He was directed to a doctor who gave him a bottle of medicine He was not satisfied and asked a policeman where he could find the city clinic so he could get his "shot in the arm" as he had previously We should be on our guard as we do not always know when we are being judged

During the third stage we see more effect upon the worker than at any other time. While it may be ten to twenty years after infection that this stage appears it may and does appear much more often and with treatment at times

in some cases

E D Crutchfield lays emphasis on early central nervous involvement. The neuro syphilitic does not always present himself as a frank tabetic with characteristic gat and severe lightning-like pains. We are apt to see a case of "indigestion" or "liver trouble". Constipation or weak bladder may be the only complaint which is noted. Rheumatism, headache, or nervousness, lack of pep, poor eyesight, and just acting queer to their friends may be spoken of

Neuritis covers a multitude of ailments Eczema and other skin conditions must be differentiated from syphilis or conditions caused by the type of work. A closer clinical examination and inquiry into the past may reveal a The spirocheta pallida has been great deal quietly working for years and the results are becoming apparent Not long ago a patient returned from a visit She had been ill, hospitalized and advised that an operation for gall stones was needed She refused, came home and resumed treatment for syphilis which she had neglected and had she told the physician the truth or he made a more careful examination the story would have been somewhat different

Other patients act queer, factory noises irritate a former faithful worker and he soon must be replaced. He may be starting on the way of the paretic or other form of cerebral spinal syphilitic and recedes into the records of the past. They are the poor individuals for whom something might have been done. Treatment of the proper kind, at the proper time might have given some help

One bright spot at this stage from our viewpoint is some information gleaned from a paper by Dr Hugh Gregroy, former pathologist at the Binghamton State Hospital He tells that in a record of 200 cases admitted to the Hospital in the five-year period from 1921 to 1925 with syphilis as the cause of their admittance (Binghamton District is 9 counties) but 8 of that number gave "shoeworker" as their occupations 159 were married, 41 were single Of the 159 married, 103 were males, 56 were females Of the 41 single, 40 were men and one

a woman Male occupations shoeworkers 8, daylaborers 18, railroad men 12, farmers 12, varied 92 Female occupations. Housewives 36, domestics 8, no occupation 7, others 6 Distribution, 163 urban, 37 rural

General paretics 15 times that of cerebro spinal type Nearly three times as many men as women Men's average age 45, women's 40 80 per cent are or have been married 44 times greater in cities than in country We hope to cut down the number giving "shoeworker" as occupation in similar report in the future No doubt we will aid some in other classes

Many case records could be given to prove that industrial efficiency is reduced greatly by syphilis in its various forms as presented. It is not alone the patient but his family as well as his employer and others who are affected. If he be a county or a state charge the tax-payer as well as the grocer is directly or indirectly affected. It has been said that a man is worth \$6,000 a year to the community in which he lives but that man is not a non-productive.

When one considers the Workman's Compensation Act and the possibilities of industrial risks it only gives another reason why industry should be on its guard—for prevention is better than cure—or as Paul E Bowers has said, "Eternal Vigilance is the price of industrial efficiency" The big question is how

is that vigilance to be interpreted?

Pre-medical examination with blood Wasserman and a spinal puncture and examination where needed. This to rule out those infected For those already employed. (H. G. Droine, M.D., D&S, Feb., 1924, vol. ix) Careful and positive diagnosis before treatment. Two or three years of observation for relapses before discharging so that relapses may be noted and treated."

The principal of treatment drugs used in doses to destroy the spirocheta pallida without harming patients and keep patient at useful work yet of no harm to self or fellow worker Guide, patients clinical response, general health and serological test

Dr O S Ormsby, Chicago, Ill, has said, "The success of treatment depends largely upon the date of its institution" The longer the disease has been present the less chance of its complete eradication

We have found that if we make it easy to get treatment and if we remove the unpleasant features of treatment we have little difficulty in getting the workers to respond. The expense is a big factor in many cases as is also the amount of time lost from work to obtain it. If these things are kept in mind it is evident the employer furnishes it with benefit not only to his own industry but to the community at

large It can be then said that if you are in need of treatment we can give it, your physician can give it, or the patient can be directed to the city clinic or health officer. Insisting on treatment is easier if it is furnished. Diplomacy is also of great assistance. In this way at least some of the inroads of syphilis will be removed and its attendant effects lessened. It cannot be done quickly but seven years has shown considerable advancement.

Some prefer salvarsan but neo-salvarsan is better than none. Insoluble mercury may be better but if more and more frequent doses of soluble form cause less inconvenience it is better than no treatment at all. In treating one can do a great deal of good and show wisdom by treating the person instead of the case. We all know that each patient has certain idiosyncrasies to drugs also to surroundings where these things are considered

A great deal may be accomplished where industrial concerns make provisions for the treatment of the usual industrial accidents. It is also possible to render treatment to the worker afflicted with syphilis and to a great degree cut down the causes of many of those accidents. Then, too, the usual absence from work due to apparently other causes will be lessened and the organization of workers will be better kept together. Then when peak production is desired there is less inexperienced help to train

We have been giving anti-luctic treatment to the workers for years and see good results not alone with the worker and employee but in his family. In most cases treatment has aided in better work and better health both to the worker and family and ability to make better wages. The majority of workers do not often move and the results can readily be seen

We give the drug best suited to the patient and in the amount best tolerated by the patient Treatments are given with as little interruption to work and vocation as possible Generally two treatments a week are given unless more are needed or indicated. Some form of mercury is given the first part of the week and neo-salvarsan the latter part. We generally give a soluble mercury as mercury oxycyanide for we have found that with the unpleasantness of the unsoluble and irritating forms the patients objects because it interferes with work

Things of this nature have to be taken into account when the worker may sit on a stool during day and arms and legs and many muscles of the body are used It is strange that while intra muscular injections of mercury are objected to—the use of bismuth salts seems to give little or no complaint Iodides are given freely where indicated All forms of salvarsan have been given but the neo-salvarsan is most favored because of the less liklihood of reactions or other complaints which It is of course would interfere with work necessary to give larger doses and more of This can be done where we can see the patient often and over a period of six or seven years

Wasserman and spinal examinations are done at proper intervals as needed. We have not given a great deal of intra spinal treatment (Swift & Ellis) but spinal drainage is done as occasion makes it seem wise. Changes in treatment occur as seems fitting with the case in hand and results are noted. Experimentation has not been done but we have tried to keep in step with progress.

In conclusion We definitely know syphilis when present, is a drawback to worker and to employee Great help to prevent its spread has been given and yet more can be done. If the employee can give it the same treatment as other agencies its spread can be curtailed and stronger and healthier workers will be the result. The children of today are the workers of tomorrow. Lets have a healthier and happier group of workers and citizens.

INJURIES TO THE SKULL AND BRAIN*

By ARTHUR M DICKINSON, M.D., ALBANY, N Y injuries have excited but us all with a seeming

In the past, head injuries have excited but moderate interest on the part of the physician and there existed marked disagreement as to their proper treatment. With the perfection of X-ray technic and as a result of the lessons learned during the World War, the problem has become more definite and clear. Good roads, fast automobiles and alcohol have combined since the war, to provide

us all with a seemingly unending supply of clinical material with which to develop more modern lines of treatment. Under conservative modern treatment, the mortality rate in head injuries has fallen from about 55 per cent to about 29 per cent.

Injuries to the scalp, without damage to the skull or brain, are frequently treated all too lightly. A little iodine or mercurochrome is applied to the small laceration and the patient dismissed. Quite often under this laceration is a fracture of the skull. The old method

^{*}Read by invitation before the annual meeting of the Essex County Medical Society, at Ticonderoga, N Y on October 4 1927

of blindly probing these wounds to feel for the fracture is mentioned only to be con-Visual inspection is the only safe All of us have had the experience method of finding abscesses burrowing here and there under the scalp, originating from what we considered a trivial scalp wound Occasionally we have seen the entire scalp lifted off of the skull by infection resulting from these slight scalp wounds If proper treatment had been instituted in the beginning, these disappointments would not have followed lacerated wounds of the scalp should be debrided, after adequate cleansing of the surrounding area, so that all devitalized and potentially infected tissue is removed. Then the wound is closed carefully without drainage if possible Hematoma of the scalp should be aspirated under aseptic conditions, thereby avoiding infection and abscess formation which follow so frequently

In considering fractures of the skull we have formed the habit of forgetting the coincident damage to the enclosed brain which in reality is the more important of the two Fractures of the skull are commonly classed as fractures of the vault or base depending upon their location and as linear, depressed or compound depending upon their nature. The symptoms of fracture of the skull will vary from those of simple concussion to those of terrific intracranial pressure The diagnosis will depend upon the history of injury and careful neurological and X-rays examination. In some instances the diagnosis of fracture will be very difficult even with the aid of X-rays Also the patient with X-ray evidence of an extensive linear fracture may have few clinical signs of such injury In general, the treatment of any type of fracture of the skull is essentially that of the concomitant injury to the brain

In the simple, uncomplicated linear fracture of the skull the patient regains consciousness quite promptly, if he has ever lost it, and all that he complains of is headache and some nausea or vomiting. We would miss the correct diagnosis in many of these cases were it not for the X-rays. Treatment consists of rest in bed, elevation of the head and an ice cap. If the patient is unconscious, intravenous injection of hypertonic solutions or lumbar puncture may be used to expedite return to consciousness. Later on bromides may be given to relieve the headache.

Depressed fractures of the skull are potentially dangerous even if the depression is slight, because of the possible development of some late brain disturbance. As you know epilepsy is said to occur in from 5 to 10 per cent of individuals who have had head injuries. The depression may be apparent with ordinary

examination or may only be discovered when X-rays are taken. It must be remembered that occasionally the X-rays do not show the full extent of the depression. The symptoms will vary from mild confusion to actual signs of brain irritation or compression. All patients with depressed fractures should be operated upon as soon as they have recovered from shock and the depressed fragments removed or elevated. Small loose fragments, unattached to dura, should be discarded. In all of these cases, the dura should be opened so that the brain can be visually inspected for injury.

Fractures of the base of the skull are serious Here again it is not the damage to the skull but to the brain which is of major consequence A blow of sufficient force to cause a fracture of the base, will, in all probability, result in serious damage to the brain. It requires a far greater force to fracture the base of the skull than the vertex and so the accompanying brain injury is more serious in fractures of the base than in fractures of the vertex most base fractures are compound, due to involvement of the cribiform plate of the ethmoid or the petrous portion of the temporal bone, the danger of meningitis is real. The common symptoms of fracture of the base are known to us all and I will not review them here might just say that a negative X-ray examination does not by any means rule out a fracture of the base. In these cases drainage of the cerebrospinal fluid from the ear occurs quite frequently, leakage from the nose not so uncommonly A few months ago I had a patient with a fracture of the base, who drained cerebrospinal fluid very freely from the nose This acted as a natural decomfor ten days pression, the patient fortunately did not develop meningitis and recovered completely While leakage of the spinal fluid is favorable in that it decreases intra-cranial pressure, at the same time it is indicative of the great danger of ascending infection and fatal meningitis In the past decompression operations were quite commonly practised in fracture of the base but today the trend is toward more conservative measures The indication in these cases is simply relief of increased intra-cranial tension which usually can be accomplished by lumbar puncture and intravenous injection of one of the hypertonic solutions Rarely is decompression indicated, for the chance fo relieving the pressure by decompression is more than overbalanced by the shock of the operation Where there is bleeding or discharge of cerebrospinal fluid from the nose or ears, these organs should be kept clean and as nearly sterile as possible Irrigation or packing is unwise

In compound fractures the line of treatment is similar to that of any other wound. The likelihood of spicules of bone or other foreign

bodies being driven into the substance of the brain must be kept in mind In these cases again the important factor is the extent of damage to the brain So any method of treatment must take into consideration the brain The scalp wound should be thoroughly debrided, all fragmented and potentially infected bone should be removed and then, using another set of instruments, the dura and brain are treated Torn and infected dura should be removed even if it makes subsequent closure of the dura impossible Damaged brain tissue should be aspirated and foreign bodies removed Probing of the brain for fragments, etc should not be done Having completed the toilet of the wound closure is made without drainage if possible. In instances where it is impossible to secure a closure of the scalp over the bone defect, a flap from an adjacent part of the scalp is utilized

Having considered the question of damage to the skull, let us turn to the more important part of the discussion, namely, injuries to the brain which so commonly accompany them

We usually think of concussion of the brain as the case in which there is no evidence of damage to the brain The patient with a concussion as a rule, promptly recovers consciousness and is none the worse for his experience except for headache and possibly nausea and During the period of unconsciousness, the pulse, respirations, temperature and blood pressure are quite normal. In reality, however, even in mild concussion cases, there are probably minute lacerations of the brain For this reason there is always a possibility that some ædema of the brain may result In some instances what appears to be a simple concussion may turn out to be a more serious It is perhaps wiser to look upon the patient with a concussion as a potentially seriously injured individual and treat him ac-The ordinary routine of treatment cordingly has consisted of elevation of the head and application of an ice cap. If we add to this intravenous injection of a hypertonic solution, or possibly a lumbar puncture, we have forestalled the possible development of ædema and increased intracranial pressure. At least by this we will accelerate the return of consciousness and decrease the subsequent headache and nausea

Most injuries of the brain result in an increase of intracranial tension due either to hemorrhage or to ædema. Hemorrhage of sufficient severity to cause marked increase in intracranial tension is usually due to damage to the middle meningeal artery. The story is that the patient sustained a head injury, was perhaps unconscious, from which he recovered almost completely, only to lapse into a drowsy or comatose state a few hours later

In this type of injury the blood pressure rises and the pulse rate falls as the intracranial pressure increases. The patient may develop a paralysis of part of the face, an arm or leg or Jacksonian attacks may occur. Any patient giving this typical history and showing localizing signs should be operated upon immediately. The clot which is commonly extra-dural is evacuated and the bleeding vessel ligated. We should remember that the injured vessel is on the side opposite to the paralysis and that the side of the paralysis rather than the side of apparent injury should be the determining factor in deciding which side to operate upon

Contusions and lacerations of the brain occur with considerable frequency in head in-The patient may have only a momentary period of unconsciousness or it may last for days As a rule these patients do not have any considerable hemorrhage but do suffer from ædema of the brain. As you know the rapidity with which a damaged brain becomes œdematous is almost phenomenal amount of ædema largely determines the increase in intracranial pressure upon which the symptoms will depend The usual symptoms are progressive slowing of the pulse and respirations with a rise in the blood pressure peated lumbar puncture and intravenous injections are used to lower the increased pressure Rarely is decompression indicated for this pur-Operation may be indicated for the treatment of the accompanying injury to the skull We cannot restore damaged brain tissue but we can avoid further damage by relieving pressure and preventing infection

Operations upon persons with head injuries should never be performed while the patient If they cannot survive the shock is in shock they most certainly will die as a result of a fresh insult resulting from operation initial period of shock is characterized by a rapid pulse, subnormal temperature, low blood pressure (below 100) and rapid respirations Also operations should not be performed in the terminal stage of medullary cedema of This stage is commonly preceded by a period during which the patient's condition has been considered satisfactory satisfactory condition rapidly becomes altered to the dangerous terminal stage of medullary cedema in which the pulse and temperature rise and the blood pressure falls The types of head injuries which do require operation are depressed fractures, compound fractures and rarely increased intracranial pressure wise rule to follow is never to operate unless there are definite localizing signs of injury to an accessible area If the signs are at all indefinite or vague, it is better to treat the patient conservatively

Lumbar puncture is a relatively safe procedure and accomplishes much in most cases

First it enables us to estiof brain injury mate the increase of intracranial tension and secondly relieves this tension. A spinal manometer is an aid to accuracy but by no means It is sufficient to reduce the pressure as visably evidenced by the decrease in the rate of flow of the fluid from the needle Lumbar puncture may be repeated in 6 to 8 Repeated punctures at hours as indicated such intervals may be continued over a period of several days Cisternal puncture is a rather difficult procedure and an unsafe one in the hands of most of us, so its use is not recommended

Of the hypertonic solutions used intravenously for the purpose of decreasing intracranial pressure, saline and glucose are the most common A ten to twenty per cent solution of sodium chloride, in a dose of from 50 to 100 cc injected intravenously produces a prompt fall in intracranial pressure action lasts for a brief period only On the other hand, 100 cc of a fifty per cent solution of glucose results in a much slower but a more sustained decrease and so is preferable in most instances Rectal injections of salt and glucose

are also used for this same purpose The one most commonly used consists of two ounces of magnesium sulphate in six ounces of water, given every 4 to 6 hours as indicated A small amount of paregoric is frequently added to this solution to exert a sedative effect upon the lower bowel and prevent expulsion rectal route of decreasing the increased pressure is rather uncertain and slow in action and its use requires frequent attention trated solutions of salts by mouth are also used with the same idea in view but are not so efficient Of all these methods, the most satisfactory is the use of glucose intravenously

Conclusions

- Treat head injuries conservatively
- 2 Operate only for depressed or compound fractures and in cases of middle meningeal hemorrhage, rarely is operation indicated for increased intracranial tension
- 3 Never operate upon a patient in shock or in the terminal stage of medullary cedema
- 4 Glucose solution intravenously and lumbar puncture are of great value in the treatment of most head injuries

CHRONIC ARTHRITIS*

By RUSSELL L CECIL, MD, NEW YORK, N Y

THE term "arthritis deformans" should be limited to that particular form of arthritis which produces deformity and ankylosis Its indiscriminate use is both unscientific and misleading, since infectious arthritis may occur in all grades of severty, 1e, in cases in which the only symptoms are slight pain and stiffness in the joints or those in which there is a moderate amount of periarticular swelling

Arthritis may be divided into three main clas-(1) infectious, (2) degenerative, and sifications (3) metabolic

Infectious arthritis may be defined as a chronic proliferative arthritis of definitely inflammatory character, caused by bacteria, usually migratory in its manifestations, and nearly always associated with one or more demonstrable foci of infection Such infection may be specific or focal, the former being caused by an exciting germ readily isolated from the joint (gonococcus, tubercle bacilli, treponema pallidum, etc.), and the latter, which is far more common, by some streptococcus not so readily isolated. In both forms the mode of infection is by the metastatic route, the bacteria reaching the joint through the blood stream. Oc-

In the experience of the author the foci of in-

casionally, a joint is directly infected by trauma fection in the order of their frequency are the

tonsils, the teeth, the sinuses, the gall bladder, and chronic infections of the prostate and cervix In young people, tonsils should always be suspected first, in older patients, the teeth are more likely to play a part. If the tonsils have been removed and the teeth are free from abscesses, the sinuses, particularly the ethmoid and sphenoid cells, should be studied with the greatest care, as infection often lurks there without giving rise to local symptoms. In stout women, the gall bladder should be under suspicion A small percentage of cases result from chronic infections of the prostate and cervix uteri

The predisposing factors in the production of intectious arthritis are shock fatigue, trauma, exposure, and undernutrition Any severe shock to the human machine, nervous or physical, is often followed by an attack of infectious arthritis Mental or physical fatigue may result in infections of all kinds, noteworthy examples being the common cold lobar pneumonia and pulmonary tuberculosis Any act te trauma which lowers the local resistance in a joint, such as sprain, fracture or gunshot wound predisposes to arthritis, as bacteria show a strong predifection for injured Sudden or repeated exposure to dampness, rain or cold is known to be one of the commonest predisposing causes Undernutrition is a factor worthy of definite consideration in the causation of arthritis, since the incidence of the

^{*} Abstract of Paper read at meeting of First District Branch Medical Society of the State of New York October 20 1927

disease is much lower among plump, well-nour-ished people than it is among those who are underweight

Degenerative arthritis is a distinct disease entity, occurring in those who are physiologically old, 1 e, in middle life and later, but occasionally as early as the forty-fifth year, and usually associated with arteriosclerosis, obesity, gray and falling hair and other sings of tissue deterioration Its exciting and predisposing causes are different from those of infectious arthritis, and it shows distinctive pathological changes. It is usually a milder disease than proliferative arthritis primary changes in the joint are a degeneration of the cartilage of the articular surface, and overactivity of the perichondrium at the periphery of the joint resulting eventually in bone lipping and exostoses This type of arthritis is sometimes called osteoarthritis for the reason that the changes are primarily in the bone and cartilage In the majority of cases the soft parts are never seriously involved. For this reason degenerative arthritis is usually less painful than the inflam-Clinically, the most striking charmatory types acteristics of this type of arthritis are its sluggish, non-progressive course, and the fact that it never terminates in ankylosis If the new growth of bone is extensive, there may be some deformity and partial limitation of motion due to locking of the overgrown margins of the articular surfaces, but as granulation tissue is absent the contiguous surfaces never fuse As the cartilage wears down the bony surfaces come into contact and there is considerable crepitation on motion. At this stage a radiograph of the joint shows extremely dense articular surfaces, and an actual increase in the size of the articular surface due to enlargement of the head of the bone. At the periphery of the joint new formed bone shows itself in the form of lipping and irregular exostoses

For convenience, degenerative arthritis may be divided into (1) arthritis of the menopause, (2) degenerative monarticular arthritis, and (3) senile arthritis, which includes Heberden's nodes and degenerative spondylitis

Menopause arthritis commonly occurs among the working classes, the symptoms usually appearing during or shortly after the menopause. Bony changes may be seen in the knees, the lumbar vertebrae and the feet. Heberden's nodes are usually present on the distal phalangeal joints

Degenerative monarticular arthritis occurs most frequently in the hip—"morbus coxae senilis," but occasionally in the shoulder and knee, and is common among laboring men of middle age. The lipping is obvious and the pathological changes and destruction of articular surfaces are more marked than those occurring in menopause arthritis.

Semile arthritis which appears late in life, is always polyarticular, attacking any joint in the body, and is a physiological process. The lesion

is essentially an osteoarthritis manifesting itself as a new growth of bone and cartilage in and about the jont

Degenerative arthritis is probably not infectious, although it may become the basis upon which an infectious arthritis develops leading to a "mixed type". The condition is a degenerative process as shown by the character of its pathological changes, its association with other sclerotic and degenerative processes, the absence of foci of infection, and the clinical course of the disease. Its chief exciting cause is trauma, sometimes acute, but usually chronic and oftentimes insidiously so. Its predisposing causes are old age, overweight, faulty posture, occupation, physical defects, and exposure

Old age is the common cause of degenerative arthritis. Hard usage or continued particular strain may result in a thinning of the cartilage and new growth of bone around the edge of the joint. Disturbance in the local circulation, such as an endarteritis, or possibly capillary destruction following compression of tissue may be a factor in this decrease of functional capacity of the joint.

Overweight in people above 45 or 50 years of age, when the tissue seems to have lost some of its resilience and the weight-bearing joints are being constantly subjected to trauma, is an important exciting cause of degenerative arthritis. The joints most susceptible to injury in the obese patient are the intervertebral joints of the lumbar spine, the lumbosacral joint the sacroilac joints, the joints of the hips, knees, ankles and feet. The hip joints seem to suffer less from overweight than the other weight-bearing joints, although they are occasionally involved. But it is in the back and knees that pathological changes and clinical symptoms are most apt to be evident.

Faulty posture may predispose to degenerative arthritis by putting unnatural strain on a joint, or by bringing about an unequal pressure on the joint surfaces. Incorrect sitting or standing, and an improper gait are often seen in obese patients, as is also a bad posture, producing strain on the lumbar region, in the knees and in the feet, which of course is accentuated by the overweight. It is in these joints that characteristic changes are usually observed.

Occupations which demand continued daily use or overuse of one or more joints predispose to degenerative arthritis. Notable examples of this are the right shoulder joint of street car conductors who spend years ringing up fares, and the hips and back of chauffeurs. Seamstresses and laundresses are prone to Heberden's nodes

Physical defects, particularly in the lumbosacral spine, may induce degenerative arthritis. A pendulous abdomen by causing slight displacement forward of a lumbar vertebra, may lead eventually to bony changes. Subluxation of the sacroiliac joint, or flat feet may predispose to degenerative changes in the affected locality, or may produce an improper distribution of weight which may in turn set up arthritic changes elsewhere. Fractures involving the articular surface of a joint may be followed by osteoarthritis

Exposure is a predisposing factor in degenerative arthritis though not as frequently as it is in infectious arthritis. Elderly people who lead hard and exposed lives are more prone to the disease

Metabolic arthritis, or gout, which is frequently unrecognized clinically, is presumably due to a precipitation of uric acid in and about the joints Its predisposing factors are a diet rich in purins,

heredity and advancing years

In addition to the three main groups described above, mixed types of arthritis occur. Degenerative arthritis predisposes to an infectious process if a focus of infection exists. Infectious arthritis, if unchecked in its course, may develop bony changes later on, and resemble somewhat the degenerative form. An acute attack of gout produces no permanent injury to the joint, but if the symptoms persist, chronic inflammatory changes occur, due to the irritating effect of the

uric acid in the tissue, and a genuine arthritis develops. With the lapse of time this may become infected, or on the other hand, develop degenerative changes

The treatment of arthritis depends upon the type. In the infectious types a relentless search tor foci of infection and their prompt eradication early in the course of the disease is necessary. After the cleaning up process, autogenous vaccines, foreign protein therapy and physiotherapy are all of value. Patients should have plenty of

rest, and should be built up physically

In degenerative arthritis, although the factor of old age cannot be eliminated, much can be accomplished for the patient in the way of removal of the chronic strain or trauma instrumental in causing the degeneration of the cartilage and bone. The patient's occupation should be investigated, and a change made if necessary. Rest to the affected joint is most essential. Overweight patients should have a low calory diet, and faulty posture and physical defects corrected. Unnecessary surgery in the way of removal of tonsils and teeth should be avoided in degenerative arthritis

INADEQUATE SKIN PREPARATION AS A CAUSE OF POST OPERATIVE WOUND INFECTION*

By HENRY B SUTTON, ITHACA, N Y

Apathetic Attitude Toward Wound Infection

T is difficult to arouse interest in a discussion of post operative wound infection in clean cases because so many surgeons feel that there is little to be gained thereby One large group considers present methods and results perfectly satisfactory They maintain that there are few infections A second group feels that some infections are bound to occur and that those which do occur are mevitable and represent an irreducible minimum third group, which is growing, states that wound infection in clean cases is too frequent and that the sources of such infection should be carefully sought These men are usually the ones who keep careful records of their results and who at the end of a period of time can state facts and not impressions concerning their results.

DATA Proves Infections Too Frequent

This last group is able to submit data which makes it seem exceedingly doubtful if the results over the country can be considered satisfactory or if an infection rate so high can be accepted as inevitable and irreducible Beckman¹, summarizing the complications at the Mayo clinic for a year, gives infection as

* Read at the Annual Meeting of the Medical Society of the State of New York at Magara Falls, N Y, May 11, 1927

the most frequent complication The infection rate in inguinal hernia was 6% MacFarlane² gives the infection rate as 7% in 500 gynecological operations Wainright's reports 38 cases of Tetanus following operation for inguinal hernia and 78 cases after oophorec-Torek states that in the best conducted hospitals the infection rate is somewhere between 7 and 17% Coleys reports infection in 14 of 50 hernia operations by the Gallie method (28%) and in 500 herniotomies studied for comparison the rate was 128% Goff⁶, summarizing 2,700 clean operations done at the Woman's Hospital in New York, says that extensive infection occurred in 47% or 129 cases Slight infection ocurred in a much larger number

These results reflect with a fair degree of accuracy the infection rate in surgical work over the country Many more reports could When we consider how infinitesbe cited simally small the amount of work done at the Woman's Hospital is when compared with that done over the entire country and consider that Goff reports 129 serious infections. we see at once that the toll of infections must be enormous The wounds at this hospital are not more frequently infected than in most other places The opinion of many good surgeons to the contrary, the conviction that infection is too frequent is growing,

ALL POSSIBLE SOURCES BUT SKIN EASILY Excumen

The multiplicity of possible sources prevents many times the determination of the break in technique and the great difficulty of actually proving anything is discouraging to the in-The purpose of this paper is to show that theoretically the skin is the most likely source of these infections and to bring forth certain facts which are suggestive of the same thing

In theory, a careful surgeon working with competent help and in proper surroundings can, with rare exceptions, protect his patient from all sources of infection but one, namely, the skin of the operative site Materials. drapes, gauze, solutions, instruments, etc., can be sterilized without question and their sterilization can be checked by the Diack con-Careful masking of the operating room personnel and visitors eliminates their respiratory passages as a source The surgeon and assistants by exercising care during the hand scrub, in putting on gloves and changing them immediately when punctured, eliminates the hands as a rule Obviously, these sources cannot be positively ruled out in every case. but in the majority of instances they can be excluded with a degree of certainty that cannot be approximated by anything that may be done to the skin It is a surgical axiom that the skin must be considered contaminated, no matter what its treatment may have been This assertion has never been disputed as far as I know

Technical Steps Show Skin is Considered DIRTY

In many clinics the knife which incises the skin is discarded, the towels are draped or even sewed to the edges of the incision to prevent skin contact and a sponge which has touched the skin is never put into the wound These are technical admissions that the skin is dirty, yet in these same clinics when infections become too numerous, the sterilizers, materials and all steps of technique are painstakingly investigated, but the method of dealing with the dirty skin is ignored How many times has everything but the skin been laboriously and fruitlessly studied?

Conserving Resistance of Tissues-Indirect ATTACK

It is usually accepted as a fact that every wound is in some degree contaminated and that the resistance of the tissues must be relied With the object upon to prevent infection of conserving the local resistance of the tissues many technical steps have been emphasized as necessary for clean healing. Careful

hemostasis, to avoid the accumulation of clot or serum, gentle handling to avoid devitalizing tissue, elimination of dead space, etc. have been insisted on and rightly so, as to carry out these steps will lessen the incidence of infection But all these steps attack the problem indirectly To conserve the local resistance of the tissues is luckily enough in many instances, but we still see infection where these precautions are carefully observed. Rather than trust to the uncertain resistance of the tissues, which cannot be determined, with the many variable and unknown factors which influence it, does it not seem more logical and certain to attack the problem directly and to attempt the elimination of bacteria from the skin Without bacteria there can be These considerations make the no infection skin seem the most likely in theory

SKIN MANY TIMES PROVEN CONTAMINATED

There are also a number of facts which, thev actually prove nothing, very suggestive. It is a fact many times proven that methods in common use do not sterilize the skin The work of Decker', Robb⁸, Browning⁹, Tinker and Sutton¹⁰, Scott and Hill12, and others show this Decker excised bits of skin after clinical iodine preparation and obtained growth of bacteria from Browning got growth in 60% every piece of his tests by scratching the skin with a needle after iodine preparation Using Picric Acid, Farr11 got growth in 42% by scraping the edges of the incision Tinker and Sutton got growth in 12% from excised bits of skin after preparation with Harringtons Solution These few studies of the methods of skin preparation in use today are proof that none accomplishes its object Many others might In Table I, a number of these are be quoted tabulated

	TABLE I							
	it of positive es from skin							
Method	prepared	for operation						
Iodine (Decker)		100%						
Iodine (Robb)	Iodine washed off	43% ,						
	Iodine left on skin	14%						
Iodine (Browning) .	60%						
Iodine (Scott and	Hill)	25%						
Picric Acid (Farr)		42%						
Harringtons Soluti	on (Tinker and Sutton)	12%						

Few Infections When Skin is Carefully PREPARED

A second fact that is very suggestive is that infections are less frequent when the skin preparation is more thorough and skin contact is more assiduously avoided. Some men who prepare the skin of their operative bone and joint cases with great care have very few or no infections Hitzrot, at the New York Hospital, who prepares the skin of every bone and joint case with chlorinated lime and soda paste, had during a period of two years while the author was on his service, not a single infection. Infection in a bone case is disastrous, so that those who do this type of work have to be very careful of asepsis. The necessity for careful skin preparation is here appreciated and carried out and few or no infections is the reward. Would not this same care in dealing with the skin in other types of operations give better results than are now obtained?

Number of Infections Varies With Skin Cleanliness

The most suggestive fact of all is that the percentage of post operative wound infection which follows any method of skin preparation varies directly with the degree of sterility produced by that method For example, Decker found bacteria present in 100% of the bits of skin he excised and Browning got growth in 60% Coley⁵ places the infection rate following iodine preparation in 500 operations at 128 Tinker and Sutton® found the skin contaminated in 12% of the tests after using Harringtons Solution clinically, and in 312 operations had three infections, a rate of 1% The greater the degree of skin contamination, the greater is the number of post operative wound infections example given we have 60% to 100% and 128% to compare with 12% and 1% This is made more clear by Table II which compares the skin cleanliness with the per cent of infections followed after the use of several antiseptics to "sterilize" the skin

TABLE II

	Growth	from	Post operative									
	excis	ed	wound									
	skin, per	cent	infecti									
Iodin e	100%	Decke	er)									
	60%	(Brown	ning)	1289	128% (Coley)							
Picric	•		-									
Acid	42%	(Farr)		\2%	(N	Y	Hos)					
Harringtons	12%	(Farr) (Tinke	r and	- }	•		•					
Solution		Sutton)	1%								
Acriflavine	0%	(Tinke Sutton	r and									
		Sutton)	0%								

It is plainly evident that a direct relationship exists between the cleanliness of the skin and the number of post operative infections. This parallelism is striking and quite suggestive that the degree of skin sterility is directly related to the number of infections.

No Advance in Skin Preparation for Years

It is a curious fact that so little attention has been paid to improvement in skin preparation during the past two decades—It is curious because the skin has all this time been regarded as unsterile. This has happened probably because the body is known to have a high degree of immunity to the organisms usually found on the skin. But we must realize that there may be at any time on any part of the body virulent organisms against which the body has little or no resistance. In such an instance infection is apt to occur.

Skin the Weak Point in Surgical Technique

An unclean skin violates the fundamental principle of aseptic surgery and constitutes the weakest point in modern surgical technique

The greatest duty of the surgical profession is to constantly seek to prevent bad results To deserve the confidence of our patients, we must strive to avoid all complications, and post operative infection is the most frequent No surgeon would consider himself deserving of the confidence of his patients if he used sponges from which bacteria could be cultured as frequently as they can be from the skin It is deemed good technique to have sterile sponges, and it seems to be deemed equally good technique to have dirty skin, since it cannot be denied that many men who consider their technique nearly perfect, operate through unsterile skin. The fact that the tissues will many times take care of the bacteria from the skin should not be allowed to befog the issue The tissues might also take care of a few bacteria from the sponges, and probably do at times, but no one would consider it permissable to use sponges with bacteria on them on this account resistance of the tissues many times takes care of bacteria has no direct bearing on the fact that a sterile skin would give fewer post operative infections

To maintain that the skin cannot be sterilized is to prevent further progress. The "impossible" has many times been accomplished in medicine Surgical progress comes only from carefully and critically analyzing our bad results and not from accepting them as ınevıtable More progress will be made in the direction of better wound healing by a study of the preoperative preparation of the skin than by a study of any or all other possible sources of infection for the reason that we have on the one hand a thing that is almost always known to be dirty, and on the other all things that are almost always known to be sterile

CONCLUSIONS

- 1 Post operative infection is the most frequent complication encountered in clean surgery
- 2 Reliable statistics prove that wound infections in clean cases are too numerous to be

accepted as inevitable or as an irreducible minimiim

3 Of the many sources of wound infection all, with the single exception of the skin of the operative field, are under the control of the surgeon if he operates with competent help and in proper surroundings

4 There are several things which are very suggestive of the fact that the skin is the

source of these infections

(a) The skin is known to be contaminated It is rarely if ever sterile and causes a break in the aseptic technique of every operation

(b) In certain operations (bone operations) when the skin is carefully prepared, there are

few or no infections

- (c) The number of post operative infections varies with the degree of sterility of the skın
- 5 It is unsafe to depend on the resistance of the tissues even when everything has been done to conserve this resistance

6 A study of the causes of post operative infection should begin with an investigation of the method of skin preparation

7 A diminished number of infections may

be confidently expected when a method of sterilizing the skin is found, as by this means an ever present source of contamination will be removed

8 We cannot honestly feel that we are doing our utmost to help our patients escape what may be serious consequences of infection until this menace of the contaminated skin is removed

PAINLESS MASTOIDITIS*

By HENRY B SMITH, MD, FACS, HEMPSTEAD, N Y

THE purpose of my paper this evening is to discuss a type of mastoiditis, which, while seen fairly frequently by the Otologist, is so seldom encountered by physicians whose major work is in other fields, that the condition is often overlooked, or a correct diagnosis unduly delayed I will also briefly report several cases

Mastorditis is unusually divided into the acute and chronic cases The acute cases, again, may be divided into two classes, first, the coalescent type, and second, the hemor-This distinction is a pathological one since these two types would appear to have a distinct difference in the underlying pathological development of the lesion hemorrhagic type is outside the scope of this paper, but I might say in passing, that the septic temperature, marked prostration, and general stormy course of these cases usually results in their getting into the hands of the Otologist early in the disease, and an early mastoidectomy is usually done

Kopetsky,1 in his recent work on otologic surgery, again divides the coalescent type of acute mastoiditis into first, the painful or classical type, second, the painless or asymp-This distinction is a clinical - tomatic type.

· Read at the September Meeting of the Nassau County Medical Society, 1926

The underrather than a pathological one lying pathology is the same in both types There are some advantages, however, in thus dividing the cases according to their clinical The first or painful type, is the most commonly observed type of mastord-It is the second or painless type that I will discuss

The bacteria found in cultures from these cases differ but little from the findings in the About two-thirds of the cases other types show a haemolytic Streptococcus The Pneumococcus number three and Friedlaender's bacillus are very prone to develop this type The Staphylococcus Pygenes Aureus, bacillus Pyocyaneus, and bacillus Diptheriae are reported but not frequent

The mastoid infection is almost invariably secondary to an otitis media, though the latter infection may be very slight The infection results in an exudation into the mastoid cells Radiographic examination at this time will show a marked clouding of the mastoid process, but no destruction of the intercellular structure. Absorption may take place, and the lesson clear up without surgical interference In other cases the exudate in the cells will become purulent, pressure is made on the nutrient arteries, and a necrosis of the bony intercellular framework results

The whole mastoid process thus tends to become one pus cavity The process may continue, destroy the inner table, and involve the lateral sinus or the dura, or may destroy the cortex, and perforate, thus forming a subperiosteal abscess The operative findings will vary, of course, with the extent of the lesion

In most of these cases this process is accompanied with so much pain that the cases fall into the painful type, are seen early, and Why, in receive early surgical treatment some cases, this lesion develops with little or no pain, often making the diagnosis extremely difficult, is hard to explain The type of infection is a factor, since Pneumococcus No 3 and Friedlaender's bacillus are found more frequently in this form The general resistance of the patient is also a factor, since mastoiditis in the presence of a debilitating disease, and especially in the presence of diabetes, is often of this type

These cases usually give a history of a primary otitis media, with pain and perhaps some temperature, relieved by spontaneous rupture of the Then follows a drum or by myringotomy profuse aural discharge, purulent in type There is little or no pain in the mastoid re-Tenderness on pressure may or may not be present. There may or may not be some edema. Constitutional symptoms are some edema slight or absent The afternoon temperature may be normal, or perhaps 991/2 degrees

The examination of the aural canal will often show a sinking of the postero-superior quadrant of the drum and adjacent canal wall Radiographic examination will show an involvement of the mastoid, with a breaking down of the intercellular structure

The two following cases are typical examples of this type of infection

Case 1—N S, schoolgirl white, age 17, consulted me March 12, 1925 Seven weeks earlier she had had a mild rhinitis followed promptly by pain in the right ear, spontaneous rupture of the ear drum, and profuse aural discharge. She consulted her physician at that time, and again about two weeks later She had continued to irrigate the ear, but had not consulted a physician for the following five weeks She attended school during this There were no constitutional symptoms She had no pain in the ear

On examination I found her temperature There was profuse aural diswas normal charge, some edema of the canal wall, and some edema of the mastoid tip. There was some tenderness on pressure over the mastoid area An immediate mastoidectomy was

done

Operative Findings—On removing the mastold cortex I found the mastoid process was

The lateral sinus was one large pus cavity exposed throughout the whole of its course through the mastoid area, there was a large exposure of dura, and both dura and lateral sinus were covered with granulations Culture from the mastoid showed a haemolytic Streptococcus

Patient made an uneventful recovery following operation

CASE 2—E L, schoolgirl, aged 7 white first seen by me in consultation on March 3, 1926 There was a history of a rhinitis of a few days' Examination showed an acute otitis media and a myringotomy was done on the right ear I saw the patient again on April 29, 1926, about eight weeks later During this time she had measles and made a complete recovery The purulent discharge from the ear had continued There was no pain, no constitutional symptoms My second examination showed a normal temperature There was some edema of the canal wall, and some edema of the mastoid process was a moderate aural discharge There was some tenderness on pressure over the tip of the mastoid An immediate mastoidectomy was done

Operative Findings—On removing the mastoid cortex I found the mastoid process one large pus cavity, with the mastoid cells entirely broken down The lateral sinus was exposed throughout the whole of the mastoid There was a large exposure of dura Both dura and lateral sinus were covered with the granulations

Culture from mastoid showed a haemolytic

Patient made an uneventful recovery following operation

Less typical than the above cases, but equally interesting, are those cases where but a small portion of the mastoid process is markedly involved Certain of these cases will develop into chronic mastoiditis unless relieved by surgical treatment

Case 3 —V H, white schoolgirl, age 7, first seen by me in consultation on February 6, 1926 The patient gave a history of a slight rhinitis about ten days prior to examination This was followed two days later by severe pain in the left ear with spontaneous rupture of the ear drum and relief of pain during the following twenty-four hours The aural discharge lasted about one day The patient then had no discomfort for about one week She then noted slight pain with some tenderness and swelling above and in front of the left ear She consulted her physician, who told her that she might be developing erysipelas The swelling was more marked on the following day, and the patient consulted Dr F F Schrick, who referred the case to me Examination showed T 99, P 105, R 25 The left ear drum was slightly reddened, dull, no bulging, no perforation, no evidence of fluid in the middle ear. There was no edema of the canal wall, no edema of the tip of the mastoid. There was some tenderness on pressure above and slightly in front of the ear, over the antrum, and over the tip. There was moderate edema above and slightly in front of the ear, extending back over the upper portion of the mastoid process. An immediate mastoidectomy was done

Operative Findings—There was a subperiosteal abscess about the size of a lima bean, lying over the anterior cells, at the root of the zygoma. These anterior cells were entirely broken down. The remaining portions of the mastoid process were not necrotic, and did not appear to be involved. Culture from the mastoid showed a haemolytic streptococcus.

Patient made an uneventful recovery

Case 4—S L, white, schoolgirl age 10 This patient had a slight rhinitis followed by pain in the right ear Myringotomy was done by her physician followed by profuse aural discharge This continued for about three weeks, at which time the patient was referred to me by Dr L A Van Kleeck Examination at this time showed a bulging ear drum There was no tenderness or edema of the mastoid, no pain, and normal TPR A second myringotomy was done. The discharge continued unabated There was marked hypertrophy of the tonsils and adenoids, and at the end of eight weeks a tonsillectomy and adenoidectomy was done Radiographic examinations by Dr J Kerrigan on June 10, June 23, and July 10, 1926, all showed some involvement in the mastoid cells The mastoid area was cloudy, but definite necrosis was doubtful. At the end of twelve weeks the discharge was moderate in amount was no pain or tenderness in the mastoid area There was no edema of the aural canal or of the mastoid tip TPR. had continued normal Mastoidectomy was done.

Operative Findings—Superficial mastoid cells appeared normal. The deep cells adjacent to the antrum were broken down, and free pus and granulation tissue were found. Culture from the mastoid showed a haemolytic streptococcus.

The patient made an uneventful recovery

Comment — The area of involvement in this case was small, and was obtaining good drainage through the middle ear. Without doubt a chronic mastoiditis with continual purulent discharge from the ear would have resulted without operation.

Case 5—L L, negro laborer, aged 40 Patient had a rhinitis, followed by an acute otitis media with a myringotomy, performed by myself This was followed by profuse aural discharge, which continued unabated for five weeks During this time there was very little pain in the ear The afternoon temperature was never over 995 Radiographic examination just prior to operation showed large mastoid cells, filled with pus or granulation tissue, with some breaking down of the Examination at this intercellular structure time showed temperature 99 There was profuse aural discharge, slight sinking of the postero-superior quadrant of the drum and the adjacent canal wall There was slight tenderness and edema of the tip of the mastoid and marked tenderness and edema above and m front of the aural canal

Operative Findings—Large mastoid cells full of pus, partly broken down Most unusual anterior cell development found Culture from the mastoid showed a haemolytic streptococcus

The patient made an uneventful recovery

Comment —The local symptoms were mostly above and in front of the ear, as explained by the unusual anterior cell development found at operation

Conclusion—Extensive necrosis of the mas toid process may develop with no constitutional symptoms, and very few local findings, other than a purulent aural discharge. In some cases even this may be absent, as in case No 3 above, where there was slight serous discharge for only 24 hours. Other cases have been reported without any evidence of middle ear involvement. All acute cases with a middle ear discharge must be watched carefully. Repeated radiographic examinations are often of value.

THE FUNCTION OF A COUNTY MEDICAL SOCIETY*

By JAMES E SADLIER, MD, FACS, POUGHKEEPSIE, N Y

President of the Medical Society of the State of New York

Thas been my pleasure, during the past several months to go about this State and meet the members of the various County Societies in their home districts. I feel very keenly that while the Wayne County Medical Society is an autonomous body, yet, at the same time, their association with the State organization is such that a closer volume of fellowship should exist between us, and we should all interest ourselves in the activities which are state-wide

Organized medicine has a very distinct field of usefulness. It would be difficult for us to even conceive of the chaos which would exist if there were no organization of the Medical Profession throughout this State and country, it would be absolutely inconceivable, but the results of organization come down to the work and activities of the individual County Society, because the County Society is the unit that we have got to rely upon for carrying on the field work in the counties throughout the State

It was very pleasing to me this morning in Syracuse, before I even reached your County, in conversation with Dr Farmer, to hear from him that you were definitely arranging a certain program along the line of Graduate Medical Education That committee, to my mind, means much of value to the physicians throughout the State This committee has carried an excellent program along the line of post-graduate work directly into the home town and thereby, to a very great extent, relieved the medical man from the necessity of leaving his practice and going to a distant locality for such study. I was also delighted to hear from one of your members of the excellent work that has been done along the line of immunization of children against diph-There is one disease that this State should rid itself of, and that is diphtheria When there is in the neighborhood of seven hundred deaths in the State of New York each year from a disease that can be prevented, it is very pleasing to me to know that this preventive work has been carried on in your County so successfully

But we have in the State Society certain problems of which I wish to speak to you When I consider the active way in which this County has carried on its program of public health I feel less restraint in talking than I would in some other sections of the State We must recognize that the question of treatment of established disease, the curative treatment is being well handled. Wherever you go you find new hospitals developing, old institutions being replaced by new ones, additions

nurses' homes, laboratories, X-ray departments and the various necessities that make for the successful practice of medicine. As we look back over the past twenty-five years we are more than satisfied. We are buoyed up by the thought that curative medicine in New York is, at least, as good, if not better, than the average standard throughout the Nation

We are now in a changing period, and the devotion of our entire time to the question of the treatment of disease is hardly in accordance with present day conditions. You are demonstrating here in Wayne County that you are accepting the changing conditions of the time, and doing excellent advanced public health work. This work, in certain sections, is being done exceptionally well, in other sections moderately well, and in some sections, almost not at all, except that which is associated with the treatment of established disease. Of course, we all realize that established disease and preventive medicine are so linked

Along the lines of public health and pre-

together as to be almost inseparable

vention of disease I feel that last year, in our State organization, there was one of the most progressive plans adopted that our organization has ever undertaken in the establishment of our Public Relations Committee Committee is important, but its usefulness will only reach out into the State provided each County Society has its local committee on Public Relations which shall act more or less under the jurisdiction of the State Committee It is very important that your Society should have such a committee I presume you already have it, if not, you should have it You should also have a very active Public Health Commit-These things are very important all appreciate the fact that thre is too much disease that comes to us that is already passed beyond a curative stage One of the most deplorable things is the fact that this person and that person comes to us too late for us to be of any material advantage to them. It is so in almost all types of disease. But especially is it so with most types of chronic disease The acute diseases are usually seen by a phymethod of physical examination of apparently sician relatively early, but unless we adopt the well people we will not be able to accomplish all that we should in the early treatment of what is ordinarily termed chronic conditions In my own section of the state we frequently have the benefit of the physical examination of apparently well people brought to our attention by those who have been to New York City and been examined in a certain clinic and then return to us for treatment And, fre-

^{*}An address before the Wayne County Medical Society in I yons New York September 21st 1927

quently, as the result of such plan we are enabled to get, for instance, cancer for treatment in its early stage. The objection is that this work should be done by the physicians themselves, it should not be necessary for patients to seek elsewhere for advice relating to their physical condition. We medical men should have been alive to the situation, and should have accepted the fact that a portion of our time should be devoted to examination of those who as yet do not consider themselves

COMPARATIVE RESULTS OF TREATMENT OF CARCINOMA OF THE UTERINE CERVIX*

By HARRY W CAREY, MD, TROY, NY

HE patient with cancer of the uterine cervix presents a serious problem so far as treatment is concerned. The physician must decide promptly what treatment will give the best

If it is an early growth, confined to a portion of the cervix, with no lateral extension toward the broad ligaments, and the uterus is freely movable, will radical hysterectomy or radium radiation or a combination of the two, give the best chance of complete cure?

In the moderately advanced case, where the growth has only begun to extend laterally into the broad ligaments and metastases are likely, will radical hysterectomy or radium radiation give the best result for the patient?

In the advanced cases, where the uterus is fixed and immovable and there is extensive involvement of the broad ligaments, palliation is the chief concern What is the best method of palliation to advise?

There is a great mass of statistics at hand giving the results of hysterectomy by the more modern and radical technic of Wertheim or its modifications On the other hand are the results obtained by the treatment of a large number of cases with radium

As informative as these statistics are, it is difficult for the physician to draw any conclusions, because the results are seldom placed side by side for comparison

In order to see the effect of the various methods of treatment, all the cases of cervix cancer that had been treated by surgical measures in our hospitals were collected and the result of the These results are placed treatment determined in comparison with those obtained in a series of similar cases treated by radium The surgical cases were collected from the records of the Samaritan, Troy and Leonard hospitals in Troy and the Cohoes Hospital from 1919 to date radium cases were treated by the writer over approximately the same period of time. The total number of cases classified according to treatment is given in the table that follows

Untreated and moperable cases	11
Advanced cases treated by cauterization	11
Early and moderately advanced cases treated	
by hysterectomy alone	19

diately by radium treatment Operative recurrent cases treated by radium Recurrent cases after cauterization treated by

radıum 26 Cases treated by radium alone

87 Total number of cases treated

As might be expected all the untreated and inoperable cases died within a few months palliative measures were employed in these, with the exception of the usual sanitary treatment and general medication

The number of moperable and untreated cases is rather startling and emphasizes one characteristic of cervix cancer, namely, its insidious onset These growths start and develop into advanced cases sometimes without giving any indication of their presence Many times however, the patient neglects the warning of irregular bleeding through ignorance of its danger Sometimes the warning is neglected by patients who have that curious attitude of mind "where ignorance is bliss, 'tis folly to be wise" Physicans are not wholly blameless Many times, when the opportunity presents itself, they fail to make the pelvic examination that might detect the growth in its early stage

The advanced cases that were cauterized as a palliative maneuver all developed recurrences fairly promptly with the exception of one patient that survived for eleven months Three of this group of eleven patients were treated subsequently with radium. All three were relieved of the bleeding and the vaginal discharge. One died in six months, one in eight months and one is still living after eight months but the growth is still

The cases treated by radical hysterectomy alone number nineteen Three are living, one operated a little over three months ago, one is well after

^{*} Read at the mee ing of the Third District Branch at Troy Y October 1 1927

four years and two months, and one is well after The duration of life in these cases after hysterectomy is given in the table that follows

tient

All but three of these patients died Only one of the three that are living has passed the five year period. This was an early and favorable Ten of the nineteen died within a year of the operation

There were five cases in which radical hysterectomy was immediately preceded or followed by radium treatment. Three are living and two are Of the two that died one survived two months and the other eight months The three that are living were moderately advanced cases The pathological specimens came to me for examination and the diagnosis established by tissue examination Two of the three are living after two and one-half years, and one after six and one-half years

There were twelve cases treated with radium for recurrence of the growth after operation Complete hysterectomies were done in all but one, where the cervix alone was removed this group four are living and eight are dead

TABLE III Duration of life in operative recurrent cases treated by

it is evident that surgical removal has not given The reason for this is due, for the good results most part, to the small number of early cases operated. Unless these cervix cancers can be operated in the earliest stage, when they involve but a portion of the cervix, good results can not be expected Cases of moderately advanced cancer practically always have metastases, and when these are present in the pelvic tissues, hysterectomy cannot be successful When it is realized that microscopical metastases are sufficient to cause recurrences, it is unlikely that they can all be removed by naked eye dissection early metastases that occur in cervix cancer that

make hysterectomy so difficult, and a successful result so infrequent There is a considerable

mortality rate for radical hysterectomy, too,

which varies in the statistics of the various oper-

ators, but is close to 10 per cent

short, usually not over a week

the five-year period arbitrarily set as the low limit

of clinical cure (Tables III and IV), but because they were all, with the exception of two, moder-

ately advanced or advanced cases on which sur-

gery could not be attempted. The treatment is carried out with minimal discomfort to the pa-

There is seldom need of a general anaesthetic and the period of hospitalization has been

In making a comparison of radical hysterec-

tomy and radium radiation in this group of cases,

over 5 years 15 18 21 24 27 30 33 36 Months 13 6 9 12 Living | |1 |1 || Dead | 1 | 2 | | 1 | 1111 1 | 2 | 1 3 years

Both patients that have lived over five years are well and free from any signs of recurrence.

The twenty-six cases treated with radium alone were all advanced, with the exception of two, and these were early and favorable cases In the advanced cases the cervix was fixed in position, there was extension along the vaginal wall and into the parametrium. In fact some were so far advanced that the condition was practically hopeless even from the standpoint of radiation. The radiation of most of these cases was undertaken for the purpose of palliation

TABLE IV Duration of life in cases treated with radium alone

Months	1 3	6	9	12	15	18	21	24	27	30	33	36	39	42	45	48	51	over 6 years
Living	121		1		1	1	1	1	1		<u> </u>	<u> </u>	11	1		<u> </u>	11	3
Dead	3	3	3	1 1		1		111		1			[[1			1	IJ	1 1

This group of cases treated with radium show better results than those treated by surgical removal, not only because five of them have passed

While there is no mortality following the use of radium, undesired local effects sometimes oc-Fistulae developed in three of these cases, two were recto-vaginal and one was a rectovesico-vaginal fistula This last patient was a very obese woman weighing over 300 lbs had a myocarditis and was edematous to the She was so short of breath that the radium application had to be made in the sitting position and so could not be done accurately This patient, with one of the recto-vaginal cases, has had the fistulous opening repaired and both are living and well While radium may cause the formation of fistulae, the cancer can and frequently does also, so that it is not always pos-

sible to determine which is the cause. Between the danger of undertreating the patient and causing a fistula there can be no choice

As a palliative measure radium radiation has given the greatest relief There is nothing that equals it for checking the hemorrhage, destroying the odor of the vaginal discharge, and giving the patient a more comfortable life, however short it may be There is no comparison between cauterization and radium for this purpose In fact there seems to be no reason to cauterize unless it be to remove redundant tissue preparatory to using radium Then there is always the possibility that these advanced cases may respond unexpectedly well to radium. One of the successful cases reported here was such a one and she lived over five years in perfect comfort and apparent good health, only to succumb finally to a recurrence in the rectum

The combined treatment of five cases with radium and radical surgical removal was quite successful. More so, in fact, than either the writer or the surgeons anticipated. As already mentioned one is living after six and one-half years and two after two and one-half years. All are free of recurrence and perfectly well. Two died within a relatively short time. The chief objection to this combined treatment, however promising it may appear theoretically, is the operative mortality to which the patient is subjected.

Preliminary radiation is undertaken to kill or render inactive the cancer cells, particularly those that may be in the parametrium Post-operative radiation is aimed at the destruction of any cancer cells that may remain after operation, either in the form of metastases, or cells spilled into the tissues by the manipulations of removal

From the analysis of the results of treatment in this small group of cases which conforms closely to the results published by others, the

physician should know

1 That early cases of cancer of the cervix are very rarely seen. When they are discovered, radical hysterectomy and radium treatment each offer promise of about 50 per cent of clinical cures.

2 That the moderately advanced case is hazardous for surgical treatment, both from the standpoint of operative mortality as well as from the small number of cures resulting. Radium radiation offers the possibilty of more cures with no operative mortality. The treatment is attended with very little discomfort and the length of stay in the hospital is short.

3 That the advanced case should never be operated and should always be radiated unless the condition is entirely hopeless. Radium in these cases offers a possibility of cure and almost sure palliation. Cauterization of these advanced growths as a palliative measure is of little value.

in comparison with radium radiation

MODERN HEALTH OFFICERS

By RICHARD SLEE, MD, POUGHKEEPSIE, N Y

Abstracted from the January second issue of the Health Officers Bulletin for the Counties of Westchester, Putnam, Dutchess and Columbia, of which Dr Slee is District State Health Officer

DISCUSSING with a supervisor the inadequate salary of a health officer, and suggesting its increase, he said "Why that man isn't earning what we're paying him now, he hasn't put up a quarantine notice in this district in six months" The supervisor was told that absence of quarantine notices throughout a district was an indication that the health officer had carried on some excellent public health work, immunizing children against diphtheria with T.A, improvement in milk production, and other public health activities

The health officer in this instance was wholly to blame for lack of appreciation of his work. He failed to consider the tremendous help of proper newspaper publicity, and to realize that the people of his community and his board of health were not mind readers and could not know what he was doing for the general good of the community unless told

Take the newspaper man into your confidence and tell him exactly what you want published, explain why certain items should be withheld. When you tell the newsman all the angles of a story he will prepare an article that is intelligent.

and keep in the background particulars inadvisable to print

It is easy for health officers to hand out morning or weekly reports following somewhat this form

CITY OR VILLAGE OF

For the 24 hours ending midnight, Jan 1, 1928, there have been reported

 Diphtheria
 3 cases

 Scarlet Fever
 1 case

 Measles
 10 cases

 Births
 3 cases

 Deaths
 2 cases

(Signed) Dr Joseph Blank,

Health Officer

Consider routine reports along the lines indicated and you will appreciate that your friend finds them about as interesting as eating a green persimmon. How is he to make a story that will interest readers, out of a report of this type? Don't feel that you have done your whole duty towards your public in handing out routine forms which may be correct as to figures but wholly un-

interesting Tell the newspaper man that one of the diphtheria cases was in a family of five children, a little tot three years of age the other four children were T A'd in school and did not develop the disease Mother thought the youngest at home would be safe Tell him that one death was of a two-year-old youngster, measles complications and explain to him the necessity for protecting children until past three years from measles infections (It is below three years that we find our high measles mortality)

Ask your newspaper man to drive out with you while you make a dairy inspection, show him what is being done to safeguard the health of the community, how you are watching the protection of your water supplies, especially after high water. There is tremendous public interest at present in health matters in general

The health officer need not write these articles, it's a gift many do not possess. The doctor can give the facts to the reporter so that he intelligently understands what you want published, he will prepare the story and put it through in readable form

The oldfashioned health officer is likely to say to the reporter "No! not a thing of interest, only one case of communicable disease reported Johnny Brown has diphtheria It's our first case in nearly two years—nothing alarming about it -it's not an epidemic, only one case Please don't mention it in your paper There is no use worrying the parents-it's only one case We'li keep it quiet and perhaps we won't have another Another very good reason for keeping it out of the papers is, that we don't want it spread abroad that we have diphtheria in town It's bad for business-it may keep the children away from the movies, stores and gatherings Parents are such foolish things, if they hear of even one case they get panicky and it sure does upset things say a word about it. We'll trust to luck and hope that good fortune will be with us Of course, if

we get a whole lot of cases, then you can publish it—as we may have to close the schools and movies. Don't forget what I told you—it's only one case. Keep it quiet. No use alarming every-body just yet. I wonder how this kid got diphtheria? First case in two years—haven't the faintest idea how."

The modern health officer will have this to say

to the reporter

"Yes! Here's some real news Little Sarah Smith has diphtheria, poor kid—never had T.A It's our first case of diphtheria in nearly two years. Hope you will see that it gets good front page display. You appreciate that it is the first reported case of a communicable disease, that is of great importance to the health officer and the community at large. It always means an undiscovered or unreported case or a virulent carrier about, and this is the factor that makes the discovery of a first case serious—or even at times alarming.

"Now get this straight—we're not worried about this first reported case—we can treat it and by proper isolation prevent it doing harm. The worry and even alarm at times is in connection with the undiscovered case or carrier, who infected this case, and may have infected many others and continues a menace until discovered or recovers. We all know that a very mild case may transmit a most virulent form of disease. It is always with the first case that an outbreak or epidemic starts, not the last case, and the time to prevent an epidemic is on the discovery of the first case.

"Now, don't fail to give this case as much publicity as possible. Parents who care for their children will bless you for the prompt warning. They will be on the watch and take proper precautions and the wise ones will have their children protected with TA.

"The press certainly is a great aid to the health officer Don't know how we'd ever put things

over without your help"

TUBERCULOSIS CASES IN ARIZONA*

By EARLE WOOD PHILLIPS, M D., PHOENIX, ARIZ

WOULD like to touch very briefly on a problem which comes occasionally to most of you in your practice. One of the questions your patient asks, "Had I better go to Arizona?" It is proper first to inquire whether you had better send anybody there. I think an answer to that can be found by the population of Arizona by people who have failed to recover their health elsewhere. The next question is to what type of patients is the climate of the southwest beneficial? At the beginning the patient should be given a chance to try to make

* An address before the Wayne County Medical Society in Lyons N Y, September 21 1927 his recovery in his own country in a samtarium. If the patient cannot progress there, he should try what a warm, dry climate will do, but it is for the advanced patient that the southwest offers the best opportunity.

Tuberculosis is a very expensive disease because it is a slow disease. So many cases come to us every year of persons who have spent their last cent and they land there flat broke. Our charitable institutions are much overtaxed. They think if they can get to Arizona that their problems are solved. They are not. Please tell them that there is very

little work to be done and a host of needy

people who are clamoring to do it

Patients don't always tell the truth about money, or they say that the family physician says, "get out in the hills and rough it and you will be all right", and others say, that the doctors say "get out in the deserts and lie in

the sand, you don't need to go to a doctor, just take care of yourself," and so many patients say it, that some must be speaking the

All these people, practically, that came to Anzona, are rather bad cases, and they need the best medical advice

HISTORY OF CARDIOLOGY*

By LOUIS FAUGERES BISHOP, MD, NEW YORK, N Y

TN the fifteen minutes assigned to me it is not possible, of course, to enter into the subject matter of the history of cardiology have recently done in a monograph, a copy of which I have the pleasure of presenting to each one of those present The number of copies is limited and I wish to know in whose possession they are so I will ask you to do me the favor of signing your name on the inside of the book and give me a memorandum of its number

In the evolution of human affairs the study and history has not been exempt from changes in methods involving definite plans for its future We think of the men of ancient times as being more primitive in their emotions and ambitions and less conscious of their relation to the past and the future The present age is very conscious of its relations to the past and the future, and even while the great war that began in 1914 was going on, definite preparations were made for the benefit of the historian a century later by preserving records and storing many relics, even including moving pictures of the battles historian of the present time is a little different from the historian of the past. He writes contemporaneous history as well as investigating what occurred a longer time ago. For the remote past I refer you to "History of Cardiology" which it has been my pleasure to present to you who are attending this meeting as a bribe for allowing me to exercise the more modern function of the studying and speaking of contemporaneous cardiology

I date my own definite association with cardiology from the year of 1907 In the fall of that year I decided to concentrate my work upon this particular field of medical knowledge and it is this period of twenty years that I wish to cover in twenty minutes. I am particularly fitted to do this because my first organized efforts in entering this special field was to make a survey of cardiology in American and cardiology in Europe I went from place to place where cardiology was taught, or where men's minds were turned specially to this problem

The first thing that impressed me in America was that little progress had been made in the development of cardiological knowledge. What

little progress had been made was through immediate contact with the problems of persons afflicted with heart disease. Rest was the one universal prescription and invalidism was encouraged on every side A heart lesson was a legitimate excuse for laziness and indulgence great consulting physicians of that day, Janeway in New York, Pepper and Musser in Philadelphia, Fitz in Boston, Forchheimer in Cincinnati, and the other great consultants in the large cities of the country had a very valuable empirical knowledge of the heart but no information whatsoever upon the subject of the technical matters of the present day In London and Edinboro found much the same condition, though in Edinboro and Dublin the practice was much influenced by the very great students of cardiology of the generation just previous, Stokes, Corrigan and Hope They were this far ahead of America in that they recognized definitely the value of graduated exercises in the restoration of the person whose heart had become a problem

That year I had the pleasure of meeting Sig James MacKenzie in London and if I had time ! would like to tell you something of the operation Two or three of the mind of this great man questions by me, a total stranger, threw him into an enthusiasm that led him to dismiss his patients and give me his day He was a canny Scot but he had an uncanny insight into medical truth and falsehood and he had no use for the doctor whose beliefs were founded upon medical authority

On the continent I came in contact with the French school of medicine where I met Vaquez The French school of medicine has always fascinated me by their profound philosophy that combines so well the intensely ideal with the mtensely practical Huchard anticipated by many years the teaching that arteriosclesosis is a general constitutional disease and not a disease of the blood vessels primarily The French still rely principally upon drugs and are remarkable for the elegance of their prescribing and intricate de-In Austria, Italy and tails of their advice Switzerland I did not find much difference from London and Paris It was in Germany that I discovered a cardiology that seemed to me worthy of study and imitation and I returned there nearly every summer until the war broke out to follow

^{*} Read before the American Section of the International Asso-ciation of Medical History, Atlantic City, May 3, 1927

and assimilate as far as possible the work of the German physicians who had a unique opportunity of academic study half of the year in universities with the rest of the time devoted to the practical application of their theoretical knowledge to a large group of people who sought the cures of Germany for the restoration of their health This was true of a number of places but at Bad Nauheim I found in Prof J M Groedel a man whom I could study and follow with profit and I am free to confess that in a large measure my own practice of cardiology has been founded upon his He demonstrated the value of a carefully recorded history and a complete collection and analysis of technical findings He also taught the value of a deferred and carefully considered diagnosis

In America I had never known of such a thing as a deferred diagnosis, that is, a definite time appointed when a conclusion can be reached, up to which time the case was allowed to remain fallow so that the final diagnosis could be independent The American conception of the and complete diagnostician was that of the fashionable physician driving to a conference in state and pronouncing in elegant language a diagnosis founded upon the quick operation of his shrewdness and In other words, the great diagnostician intuition was a great guesser In Germany I found that the diagnosis was the final step in a process other words, the investigation was carried on to lead up to a diagnosis rather than to prove a diagnosis already made. It has taken this twenty years for the technical cardiology which was then well under way in German clinics to spread over the world and become accepted as a real human asset

I was an early convert to technical cardiology and with the other pioneers had to stand the adverse criticism of those who did not understand when I insisted that every person who presented a cordiological problem should have the benefit of a complete technical examination. I was accused of commercialism because I paid too much attention to people brought to me by their physicians with the old-fashioned demand for the listen and guess diagnosis. But cardiology was a wonder-field of blossoming flowers and new ideas, and here and there a sturdy plant represented definite results in the rescue of human wrecks from invalidism and even worse.

This cardiological field was pleasant and interesting and in time I knew that others would come into it and that eventually cardiology would be a Whether that time has arrecognized specialty rned or not I have been unable to decide but there are some signs that make me believe that very soon there will be a group of men devoted to cardiology, large enough to form their own national society where they can confer with each other on their intimate problems At the present time the intimate problems of cardiology must be carried to general meetings where they receive an unsympathetic hearing from those who do not We are forced to fight our losing understand battles in private and publish practically only our successes It is only when cardiologists decide to get together in private that the profound difficulties of cardiology can be properly attacked and solved

I have given you the history of cardiology in printed form and talked with you in this familiar way of contemporaneous cardiology. One of the greatest writers on cardiology that I ever knew was a very obscure man whose name you would not know. His was a great mind in an obscure corner. He said that the cardiologist was a peculiarly isolated personality and I must say that sometimes in the past it seemed he was right. However, now it would seem that the date of the foundation of cardiology as a recognized branch of medical knowledge will soon be written on the pages of medical history.

A CASE OF DISSEMINATED CARCINOMATOSIS — TEN YEARS FOLLOWING RADICAL OPERATION

By EUGENE E MARCOVICI, MD., NEW YORK, N Y

THE following report seems worthy of attention in view of its history and certain clinical peculiarities

HISTORY

June 20, 1926 Mrs H H, 48 years old, married 25 years She has a twenty-four year old son Her parents and son, according to her statements, never suffered any serious illness In 1916 she underwent an operation which, her husband states, was said to be for abdominal tumor About January, 1926, a tumor appeared on the lower sternum, this was painless Three months following, another tumor developed over the right second rib, and simultaneously a third developed under the third left rib Both were

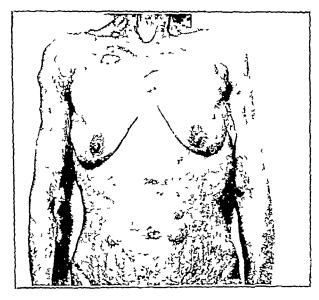

about the size of a pea and freely movable Since then similar tumors have appeared on the chest, back, scalp, face and forearms, all were painless. About June 15th still another tumor, about the size of a pigeon egg, appeared in the right axilla, this was painful and showed signs of inflammation (redness, swelling). It ulcerated the following day and left a dark red surface with a serous evudate.

For about a week the patient suffered from dyspnoea, paroxysms of coughing without expectoration, distension of the abdomen, edema of the feet, general weakness, headache, vertigo and marked diminution in the quantity of urine She was unable to work whereas up to two days ago she was able to assist her husband, a tailor,

in his work. Her appetite was not affected and her bowel movements were regular

PHYSICAL EXAMINATION

The physical examination shows an emaciated woman of 48, temperature normal, weight 109 pounds, blood pressure 140/100 Patient is suffering from shortness of breath and a spasmodic, dry cough, which is extremely annoying while lying down Posture is stiff Skin and visible mucous membranes pale, tongue moist, slightly coated Facial nerves show no evidence of pathological symptoms The scalp shows the presence of six tumors, ranging in size from a pea to that of a walnut These tumors are not adherent and freely movable. On the anterior wall of the thorax there are about thirty-six tumor, all varying in size The largest and less recent, which appeared six months previous to presentation, is situated between the third and fourth

ribs, on the left side, and extends over the lower sternum, this is not movable, of hard consistency, painless and measures 8 x 4 x 2 cm tumor over the right second rib, as mentioned in the above history, measures 2 x 3 x 1½ cm The ulcerated tumor in the right axilla measures On the posterior thorax there are $5 \times 3 cm$ about sixteen tumors, seven additional ones on the neck, five larger ones over the abdomen, extending deep into the muscle layer companying photograph) Below the site of the abdominal operative scar there are about five tumors of more recent origin (1 week), ranging in size from a pigeon egg to a chicken egg inguinal and regional lymphatic glands are en-larged and infiltrated Between the left angulus scapulæ and the vertebral column there is still another very painful tumor situated between the proximal ends of the seventh and eighth ribs

and probably involving the latter. No other bone metastases are evident. X-ray pictures of the medulated bones and the vertebral column were not taken because of the patient's condition. Even though at this time no phenomena of compression were evident, the rigid posture of the patient would nevertheless seem to indicate an involvement of the vertebral column Aside from a few small tumors on the upper arms and thighs, the extremities present only the highly developed edema of the lower part of the legs and the dorsum of the feet.

Heart Systolic murmurs (accidental), no diatation, pulse rapid, of normal quality Pleura Dullness on the right side, anteriorly, extending down from the upper border of the fifth rib, posteriorly from the angulus scapulæ, on the left side, dullness extends posteriorly, a finger's breadth above that on the right Over this region there is no vocal fremitus, compressed breathing over the dullness, no breath sounds Diagnosis Exudate both sides in the pleural cavity Liver and spleen Palpable, not enlarged Free fluid in the abdomen

LABORATORY EXAMINATION

Urine Specific gravity, 1030, reaction, acid, traces of albumen, no sugar, indican increased. Microscopical examination Shows leucocytes, granular casts, epithelia, uric acid crystals No evidence of Bence Jones bodies Examination of the blood Wassermann reaction, negative, erythrocytes, 5,050,000, leucocytes, 8000, hemoglobin, 55 per cent, polymorphonuclears, 75 per cent, large lymphocytes, 10 per cent, small lymphocytes, 8 per cent, neutrophile myelocytes, 5 per cent, no eosinophiles

While the appearance of myelocytes in the blood is of interest, it is still of greater interest the findings in the smear of the ulcerated tumor. The differential count in the latter showed 4 per cent eosinophiles, 4 per cent mast cells and 5 per cent neutrophile myelocytes. The increase in the eosinophiles should be interpreted here as a local irritating eosinophilia. The number of mast cells appears quite high in comparison to the figures as given in literature. Conti, in the peripheral blood of a case of primary multiple myeloma, found 2 per cent mast cells, 4 per cent eosinophiles and 6 per cent neutrophile myelocytes with a leucocyte count of 3,400

CLINICAL COURSE OF THE DISEASE

A month later I again had occasion to see the patient, who still refused hospital treatment She had lost very much in weight, although the edema had considerably increased (edema and anasarca of the legs, abdomen and sacrum) Face very pale On account of the dyspnoea and the increased spasmodic cough the patient was able to lie down only with great difficulty and

because of the edema she was unable to be up The ascites and pleuritic exudate and around have markedly increased Temperature normal Tachycardia The tumors, which have become generalized, now covered the entire body with the exception of the face, hands and feet size of the tumors have increased, particularly those over the former operative scar axillary tumor which has twice been treated with quartz light was disappearing and its former ulcerated surface almost healed Another bone metastasis has developed in the seventh left rib in the axillary line This was very painful and about to fracture A new destructive process has begun in the sixth dorsal vertebra, which was also very painful on pressure

A second blood examination showed Hemoglobin, 55 per cent, erythrocytes, 5,375,000, leucocytes, 11,800, polymorphonuclears, 77 per cent, large lymphocytes, 9 per cent, small lymphocytes, 17 per cent, eosinophiles, 1 per cent, transitionals, 2 per cent, mast cells, 1 per cent, neutrophile myelocytes, 3 per cent. A comparison with the previous blood examination showed an increase in the number of leucocytes with no diminution in the number of red cells and a similar hemoglobin percentage, no polklocytes or nucleated red cells, red cells show deficiency in coloring, microcytes and macrocytes in moderate number, blood platelets greatly reduced

Urine Very concentrated, contains albumen Bence Jones bodies, negative

TREATMENT

Treatment, which at this time could only be symptomatic, consisted of diuretics (diuretin, species, diureticæ, liquor kalii acetici) and tonics (intravenous iron arsenite injections, camphor oil). Novasurol was employed by the author in a case of an intestinal and peritoneum carcinoma with considerable ascites, and instead of the desired diuresis the action on the intestines was disastrous. 30 to 40 evacuations with severe tenemus, a condition which made the last days of the patient most unbearable. Patient still refused hospital treatment where a scarification of the edema could be done and the pain alleviated. She died on August 7th.

As a post-mortem examination was not made, the various reports of the histological sections, which would have been valuable, are not added to this report

DIAGNOSIS

The differential diagnosis before the histological findings was difficult, the numerous tumors with their various localizations, particularly the various bone metastases, at first would suggest a primary tumor in the bones (osteo or chondrosarcoma, multiple myeloma, endothelioma or enchondroma), secondary metastatic tumors

of the bone marrow as secondary multiple myeloma, were also to be considered

All forms of malignant tumors may eventually lead to metastases in the skeletal system, frequently carcinoma, less frequently sarcoma, melanotic sarcoma, lymphosarcoma, generalized tumor formation in the medulla in hypernephroma, and in glioma of the retina Carcinoma of the breast, prostate, thyroid and stomach lead most frequently to bone metastases They appear simultaneously in other organs, particularly in the lymphatic glands. There is a general carcinomatosis or sarcomatosis, which spare practically Only in rare cases are the primary tumors located in other organs (the bronchial tubes, gall bladder, appendix, ovaries and uterus) Von Recklinghausen called attention to the tendency of prostate carcinoma to metastate in the skeletal system

The absence of bone fractures, Bence Jones bodies, relative painlessness, hard consistency and the presence of multiple tumors, independent of the skeletal system, all speak against a diagnosis of primary multiple myeloma multiple myeloma usually attacks the bones of the thorax, there are usually bone fractures, frequently affecting the ribs, there is kyphosis, and the condition is very painful. The diversified localization and the rapid metastation do not justify a diagnosis of osteoma, osteosarcoma or The absence of pigmented chondrosarcoma tumors, of a primary tumor at the typical seat of predilection, and melanin in the urine would elimmate the diagnosis of melanosarcoma remains but the choice of a general carcinosis or sarcomatosis, which could have been determined by histological examination only metastasis of a malignant abdominal tumor with general dissemination in the skeletal system, subcutaneous cellular tissue, muscle layer, pleura, peritoneum, and internal organs, was the most acceptable diagnosis

The histological report of a nodule extirpated on June 22nd was as follows Gross examination showed a small nodule 10 x 5 x 4 mm, of vellowish color and soft consistency, taken from immediately under the skin Microscopical ex amination shows the nodule to be separated by a thin fibrous capsule from the adjacent subcutaneous adipose tissue The capsule is infiltrated in various areas by strata of large polygonal cells The section is composed of acini with narrow lumen, consisting of cuboidal cells with large rounded nuclei The nuclei are dark in color and frequently contain a nucleolus Occasional mitotic figures are found. There is a connective tissue stroma separating the acini and in this connective tissue stroma there are occasional round bodies which stain homogeneous blue, apparently calcium deposits

The histological picture is definitely that of an epithelial tumor of glandular structure. The

presence of calcareous concrements in a tumor composed of small acini is very suggestive of a primary ovarian adeno-carcinoma. Diagnosis Metastasis of an adeno-carcinoma, most probably ovarian. (See histological figures.)

While primary multiple myeloma is a rare discase (Sternberg, Verse, Berblinger, Wieland, Christian) secondary multiple myeloma, the metastatic tumors of the skeletal system, are more frequent. Among the various localizations of metastases of malignant tumors, the generalized metastasis in the skeletal system is most Of greater occurrence are metasuncommon tases in other organs Single metastasis in one or a few bones is more frequent and is not interesting clinically, causing but local symptoms Metastasis may occur at a time when the primary tumor is recent or at a more advanced stage However, it frequently occurs that after the extirpation of a malignant tumor, it doesn't recur locally but as a metastasis in the skeletal system several years following the apperently successful operation of the primary tumor at a time when one would be justified in assuming that the patient is cured In this instance the recurrence occurred six months previous to presentation as a painless swelling in the region of the lower sternum

In generalized primary and secondary tumor formation in the bone marrow, blood conditions, as found in this instance, are not infrequent, the low hemoglobin content and diminution in erythrocytes, with the presence of normoblasts (none in this case), the usual normal leucocyte count, but the presence of pathological cells (neutrophile myelocytes as high as 17 per cent in the case of Kurpjuweit (Primary tumor gall bladder carcinoma), eosinophiles as high as 42 per cent in the case of Schleip, primary tumor multiple bone sarcoma), mast cells, 24 per cent in the case of Harrington and Kennedy (primary tumor stomach carcinoma) are frequently mentioned in literature (Hans Hirschfeld) cyte counts as high as 20,000 with high myelocyte count in the case of Kast (primary tumor penis carcinoma) and in Hirschfeld's cases (up to 53,000) are rare and are probably due to suppuration A remarkably high number of normoblasts and megaloblasts, polychromatophilia and basophiles is described, the presence of polymorphonuclear neutrophiles without granules as Hirschfeld (very numerous in my case) an increase in the eosinophiles and mast cells is only very seldom mentioned

The edema on the legs and the ascites are caused by the compression of the vena cava, or impairment in the portal circulation, partly as exudation ascites of abdominal metastasis or possibly by the tumor growing into the cava inferior

This case is one of general carcinoma with bone metastasis and offers a number of clinical peculiarities, which briefly summarized, present the following

- 1 Extremely delayed relapse, ten years following a radical operation, probably for ovarian tumor
- 2 The lack of symptoms of the original bone metastasis, causing the patient to entirely neglect the tumors at first
- 3 The histological diagnosis (Dr Klemperer), which not only explains the nature of the tumor (metastatic carcinoma), but also gives the probable origin of the tumor (ovarian tumor)
- 4 The blood report with the presence of myelocytes and the more charactertistic blood findings in the smear of the ulcerated tumor, with an unusually high number of mast cells, as well as the increase in the myelocyte count
- 5 The favorable results of irradiation, in the ulcerated tumor, with quartz light, which, of course, could not possibly influence the far advanced general process, but if applied when first indicated, would perhaps have been valuable, as can be concluded from the effectiveness of the local treatment

BIBLIOGRAPHY

Because of the brief, casuistic report of the case, the reader is referred to the work by Hans Hirschfeld, entitled "Generalized Primary and Secondary Tumor Formations in the Bone Marrow," in which the complete data are given (Firket, Kast, Mueller, Rampold, Ritchie, Stewart, Robert, Warrington, Kennedy and Zade)

(Kraus Brugsche Spezielle Pathologie und Therapie innerer Krankheiten—"Special Pathology and Therapy

of Internal Diseases")

MEDICAL HOSPITALITY IN NEW YORK CITY

New York is the most friendly and hospitable city in America, although one might not think so when he is pushed and jostled in the subway But when he is in trouble or seeks information, he receives courteous attention from everyone to whom he applies

The physicians of New York City also show

an informal triendliness to visiting brethren who seek information. Many a doctor who is staying at a hotel would visit a hospital or attend a clinic if he knew of one in his immediate vicinity. The New York Academy of Medicine offers this friendly service, either by personal visit, or by telephone, as described on page 158

THE VALUE OF MEDICAL SERVICES

Values are determined by certain standards. and when one thing is compared with another. the same standard must be applied standard of value that is most commonly used is the dollar Physicians have adopted scales of fees for their services, the basis of which is the economic needs of the physician himself Long experience has demonstrated that a certain amount charged for a call or an operation vields the doctor an income that is sufficient to enable him to live according to the customs of the better class of people of his community This method of valuing his service is different from that of the lawyer on the one hand who charges a percentage of the money involved in his case, and on the other hand it differs from that of the minister of the Gospel whose maintenance is provided by voluntary contribution of his parishioners, and whose services are free

The physician adapts his fees to the financial condition of his patients to only a limited degree. The poor pay him little or nothing simply because they cannot give him something that they do not have. The rich pay the maximum fee which is scheduled on the fee card without regard to the time and money which the rich business man saves as the result of the doctor's ministrations.

Physicians generally are satisfied with the fee standards that are adopted by their medical societies. If a physician cannot make a good living by charging according to the fee table, the fault is usually his own

Patients too are generally satisfied with medical fee standards, especially in these latter days when a plumber or a brick layer charges more than a physician A patient will pay for relief from a broken bone, or a boil, or a bad cough, for those conditions are evident and dis-But patients are not educated regarding the value of modern methods of diagnosis They are willing to pay for and treatment x-rays, for these have a mystery which partakes of the spiritual and miraculous are also ready to pay for electrical treatments, for these produce sensations which the patients interpret as immediate therapeutic results There is a great field in medicine in which comfort is involved, rather than health or life

A patient often seeks physical comfort just as he seeks any other luxury. He seeks relief from annoying pains and from the fatigues of overwork or late hours, or dissipation. The sort of treatment which he seeks partakes of the nature of a business transaction, in which the doctor gives the patient as many pleasant treatments as are desired, at a good-sized fee. There is little or no responsibility associated with the treatments, and the doctors who sell

the luxury treatments get rich. The value of their services is that which the patients place upon them, and it is far higher than that put upon it by the doctor's colleagues who practice strictly scientific medicine.

If the value of medical services is judged by the amount of money which a doctor collects and the number of patients that throng his office, then the physician who dispenses therapeutic luxuries ranks high according to the ordinary standards of the public But there is also a scientific standard of value of which the people can judge only by the relatively few cases of sickness which do not get well spon-Victims of a general disease aristaneously ing from an obscure focus go from doctor to doctor and from clinic to clinic and get a varied assortment of diagnoses and treatments, any of which may be correct, but none reaches the key source of the infection, for each doctor sees one organ and none considers the person as a These patients place a low value on whole medical services because they sought relief and failed to get it On the other hand, they spread the fame of one who happens upon the key diagnosis after half a dozen other doctors have failed

When an acute disease comes upon a patient who has been well and active and has led a normal life, the indications are usually plain, and a few ordinary examinations are all that are needed in order to establish an accurate diagnosis. The people appreciate the value of the doctor's services, and pay him willingly. But the condition is entirely different in a chronic case like the following.

A woman, aged 55, formerly subject to asthma, developed obscure pains in her arms and back, and ran a low fever at times lost twenty pounds of weight, her eyesight slowly became hazy, her eyelids became puffy, and in six months she had great difficulty in going about her house She went to several doctors who made some of the more evident examinations, both physical and laboratory, and agreed in only one item, that she had a beginning cataract of both eyes specialist whom she had consulted was an oculist who gave her about ten minutes of his time in a prefunctory manner about once in two months, and told her that her trouble was cataract

The patient was sent first to an eye specialist who made a complete examination of her eyes, including the field of perception for various colors. His diagnosis was cataract with eye symptoms due to a general infection.

The patient was then sent to an internist who made a complete physical examination, and took a minute history of every medical phase of her life He then sent her to a hospital where x-ray and laboratory examinations were made

The diagnosis was cataract, trichinosis of a mild type (which was disappearing spontaneously) and severe pyorrhoea, which yielded promptly to treatment. The patient has shown a rapid improvement in health and morale

Now, as to the value of the medical services which she received Each specialist and the hospital charged the usual fee for services rendered The bill of the oculist was about \$150, of the internist, \$100, and of the hospital including laboratory fees, \$150, a total of \$400, which the patient paid willingly for the complete medical examination and the co-ordina-

tion of the opinions of the physicians. Her family physician carries out the directions of the specialists, and altogether the case is a model example of efficient medical services appraised at a proper value by the patient, the family doctor, and the consulting specialists

family doctor, and the consulting specialists

This case illustrates an ideal condition in which there was an unusually happy conjunction of three independent parties, the patient, the family doctor, and the specialist, any one of whom might readily have upset the mutual understandings. Three elements enter into this case and into all others, 1, scientific skill, 2, medical ethics, and 3, personal temperaments, and possibly the greatest of those is temperament.

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Medical Ethics—The leading article in the New York State Journal of Medicine of February, 1903, is an editorial on the need of a code of ethics. It refers to a letter by Dr. R. T. Gilmore of Chicago, reprinted from the A. M. A. Journal. The doctor gives his personal experiences with consultants while he was a young doctor just starting in practice. Experience number one was that a surgeon whom he had called to see a well-to-do patient with uterine bleeding, assumed full control of the case and did a hysterectomy for forty dollars, graciously inviting the family doctor to see the operation. Concerning this consultant, Dr. Gilmore says

"He is too busy now to think about such a trifling thing as ethics. He may have seen the word written somewhere. He may possibly glance over the Association's revision of the Code, but it will never occur to him during his eminently successful and busy career to drink of the spirit of these rules and regulations. He is too old to learn. Hundreds of men will continue to witness his operations and to learn what they may from him, but if they have good sense, they will avoid him assiduously as a consultant. Meanwhile he will unconsciously continue, day after day, to go on with the gentle art of dampening the youthful ardor of the enthusiast who leaves his alma mater with high ideals and ethical aspirations. He will make these men smile at the

mention of Flint on Ethics, and have thoughts unfit for publication when he reads, 'Of the duties of the physician in regard to consultations'"

The second experience occurred when Dr Gilmore had the parents of a very young baby bring the child before the local medical society in order that he might demonstrate a method of treating a thigh broken during delivery. A prominent colleague condemned the young doctor for breaking the leg. Concerning his actions Dr Gilmore

"The point I wish to emphasize is this. The doctor who 'called me down' before my patient was a thoughtless man. If he reads this article he will probably not remember the incident. He had never met me personally before, nor has he since. There was no malice, no evil intent, and I doubt if the majority of men present at that meeting gave the incident even a passing thought, so little would such a gross breach of ethics attract attention at the present time. But I ask in the name of all that is lofty in medicine, what an effect such an affair would have on a young fellow who had just started out in his practice, and who could not see how he was going to get money enough together to buy a winter overcoat."

Physicians of this generation have little personal experience with medical ethics of twenty-five years ago Medical ethics has advanced

quite as fast as scientific medicine

MEDICAL PROGRESS

New Views of Eclampsia.—H Rossenbeck of the Institute of Physical Chemistry of the University of Basle discusses eclampsia from the standpoint of his special field of endeavor As a result of his speculations he arrives at the opinion that the convulsions of the gravida represent an effort of nature to rectify a pathological condition, even though the aim is not often accomplished The blood state of the patient is an acidosis while the tissues exhibit an alkalosis The muscular contractions are known to liberate acids-phosphoric and lactic-which are able to neutralize this tissue alkalosis, which in turn is the result of accumulation of sodium which cannot get into the blood in its present form. When combined with the acids mentioned, however, it may enter the blood where the excessive acidity can also be neutralized But this disturbance in the equilibrium of the ions must itself be secondary to some other factor, and the author sees the possibility that hyperfunction of the hypophysis may be the factor in question The author admits that this theory is advanced only as something to be tried out and not as possessing anything of finality He also admits that such an hypothesis is thus far barren of any suggestion of therapeutic value However, it gives both a direction and a goal to the inves-His personal contribution is limited to an ionic analysis of the blood serum in several cases of eclampsia, pregnancy kidney, and epilepsy, in which he found that the sodium ions were notably decreased (in contrast with the finds of earlier analysts who had reported This implies that the sothem unchanged) dium ions in the tissues at large are corre-This is not all, for at spondingly increased the same time the ions of chlorine are increased in the blood and inferentially diminished in the tissues. Hence, if the author is right, eclampsia and allied affections are due to a disturbance of the Cl-Na equilibrium in the solids and fluids of the body —Schweizerische medizinische Wochenschrift, November 5, 1927

Carriers of Tubercle Bacilli—Dr M J Gutmann discusses this subject which because of its difficulty is best indicated by examples. Thus a woman of 30 years, plump and healthy in appearance, chest negative on repeated examination, presented a few acid-fast bacilli in the sputum which did not agree fully with Koch's bacillus. The rectal temperature was clevated a few degrees and this rise was later accounted for by the presence of an obstructed tonsillar crypt. This tonsil was extirpated and

the same acid-fast bacilli were found in the crypt but with no evidence of tuberculosis The reaction to old tuberculin was not decisive. The milk drunk by the woman contained the bacillus in question The author concluded that in this case the bacilli were of low viru-The case is not without precedent, for reports show that such acid-fast bacilli are taken into the organism through the milk or butter and appear later in the sputum-perhaps, as in this case, in consequence of lodging in the tonsil In this case the woman had had an annoying cough for two years and a provisional diagnosis of apex invasion had been made, but study of the case had shown the lack of a foundation for this judgment The same element of doubt must obtain in all alleged cases of healthy carriers, and some of the latter may be shown to have passed through an infection, although subsequently there may have been no evidence of the dis-Von Hansemann has shown that the tubercle bacillus in a virulent condition may be harbored in bronchiectatic cavities, so that the ante-mortem diagnosis may have to be corrected at autopsy To add to the confusion there are false tubercle bacıllı which live in The saprosymbiosis with the real organism phytic tubercle bacillus may regain its virulence by passage through animals never can feel sure that a given subject may not have been tuberculous in childhood, it becomes almost impossible to compare tubercle bacillus carriers with typhoid or diphtheria carriers - Munchener medizimsche Wochenschrift, November 4, 1927

Abdominal Symptoms of Heart Disease, with Special Reference to the Rôle of Auricular Fibrillation - Alfred M Wedd (Surgery, Gynecology and Obstetrics, December, 1927, xlv, 6) discusses certain groups of patients suffering from cardiovascular disease, who, because of the predominance of abdominal symptoms, often present themselves to the surgeon These abdominal symptoms may be purely reflex, as the abdominal pain, nausea and vomiting, seen in disease of the coronary arteries or acute inflammation of the heart, or there may be secondary changes in the abdominal viscera which are responsible for the symp-In the latter group, symptoms dependent on acute or passive congestion of the liver and portal stasis are common They occur frequently as a result of auricular fibrillation and the impairment of the circulation dependent on the arrhythmia itself offers a ready explana-

So completely may the liver compensate for the inadequacy of the pump by removing a large volume of blood from the general circulation, that these patients may show not only the absence of edema but even no congestion of the lungs and slight or no cyanosis The accumulation of blood in the liver may occur so rapidly that the capsule is suddenly distended producing acute pain in the upper Abdominal symptoms resulting abdomen from infarction of the spleen and perisplenitis occurring in subacute bacterial endocarditis have been observed. The writer reports three cases in which laparotomy was performed under these circumstances It should be remembered that patients suffering from cardiovascular disease may develop any known abdominal disease, but because of the frequency and variability of abdominal symptoms in purely cardiac cases the burden of proof is on the establishment of an independent pathological process in the abdomen

Diagnosis and Curability of Amyloid Disease -H Waldenström, a Swedish surgeon interested especially in surgical tuberculosis, in an important contribution to our knowledge of amyloid disease, gives some new data on this subject which are of great interest. Amyloid has heretofore been regarded as something final and fatal, giving the worst of prognoses because it is not known to be absorbed The author, in following up some cases of amyloid liver and spleen, profited by the recommendation of a colleague to puncture the liver in the interest of a biopsy This was in 1917 and after repeated efforts he obtained from 12 individuals 10 beautiful specimens of amyloidosis of the liver The patients suffered from the prolonged suppuration incidental to surgical tuberculosis with mixed in-In this way our knowledge of the diagnosis of this affection has been greatly advanced for heretofore the diagnosis has been inferential save when the urine contained the waxy casts of amyloid kidney But this is not all, for the author continued to puncture his livers to control the progress of the disease and was surprised to find that in some of the amyloid areas of the liver this tissue had disappeared Thus far he has evidence of the complete curability of amyloidosis, which is of course to be anticipated when the suppuration is checked. One patient had ascites due to an enormously enlarged liver yet made a complete recovery With the closure of bone fistulae he now looks forward to this favorable termination -Klimsche Wochenschrift, November 19, 1927

The Cause of Scarlet Fever — Mandelbaum, the bacteriologist of the Munich-Schwabing Hospital, Munich, has been at work on this

subject for ten years, and while he does not deny that the hemolytic streptococcus and its toxin are responsible for scarlet fever as we know it clinically, he regards it as a secondary invader and not the primary cause of the dis-He has found in about 4 per cent of throats of sufferers from scarlet fever, a microorganism which was at first believed to be the bacıllus of diphtheria, but attempts at pure culture were finally successful in showing that it had no connection with the latter nutrient medium of serum basis containing lipoids this organism is able to form myelin drops which sufficiently distinguishes it from all diphtheritic and pseudo-diphtheritic bacilli In seeking to trace a connection between the activities of this organism and the disease he believes that he has shown that it is in itself able to give rise to the latter, the syndrome set up by the organism, however, differs in some respects from classical scarlet fever in which presumably the hemolytic streptococcus is actively pathogenic Clinically the disease as set up by this pseudo-diphtheria bacillus has a greater resemblance to diphtheria than to scarlet fever, and only the supervention of desquamation called attention to the possibility of an error in diagnosis The disease appeared as a simple or diphtheroid angina or a bloody rhinitis Such cases might readily have passed for diphtheria but for the author's method of differentiation Some such factor is necessary to account for the full natural history of the disease, for it is evident that children who harbor these peculiar organisms are carriers of scarlet fever-not as might be thought carriers of diphtheria. It enables us to explain mysterious outbreaks of the disease without apparent contagion In at least 90 per cent of scarlet fever cases we shall not find this organism at all The streptococci quickly force it out of the picture The author's paper is of course a tentative one, as much remains to be learned of his new find -Munchener medizinische Wochenschrift, November 11, 1927

The Potential Severity of Mumps-J K. Friedjung of Vienna mentions the prevailing impression among practitioners that epidemic parotitis is mild and harmless although distinguished pediatrists regularly point out that it may be The symptoms which may occaserious at times sion some solicitude are high continued fever great prostration and emaciation, etc., believed to be determined chiefly by metastases to the testicle or pancreas In the first place, the name parotitis is a misnomer for instead of the parotid the submaxillary may be the chief seat of the infection or the two salivary glands may be synchronously involved. Epidemic submaxillaritis would in fact be the more suitable name But the sublinguals may also participate so that "salivitis" would be still more appropriate, especially

as the pancreas, sometimes termed the "abdominal salivary gland" may also participate volvement of the testicle in this affection is a paradox, for this gland has nothing in common anatomically or functionally with the other structures mentioned Orchitis is much more rare than is commonly supposed and the much experienced Henoch stated that he had never seen a case The author has seen two cases, one in a boy of 11 and the other in a youth of 16, while a third came to light after the completion of the paper and is mentioned in a foot-note, the patient being a youth of 15 Both the second and third patients were sexually developed while the first was sexually immature, thus disposing of the statement sometimes encountered that only sexually mature males are attacked by orchitis Only the second case is given in detail. This patient suffered from double orchitis and pancreatitis and both parotids, submaxillaries and sublinguals, were involved. For five days there was a continuous high temperature which sometimes passed 104°F and resisted all attempts to lower it. The patient made a good recovery, or at least there is no mention of any sequelae - Munchener medizinische Wochenschrift, November 18, 1927

Ear Complications of Mumps — Professor O Voss, an otologist of Frankfurt am Main, refers to disturbances of hearing and equilibrium sometimes encountered in epidemic parotitis These were once thought to depend on extension by continuity of the inflammatory process from the parotid through the petrosquamous fissure, or by implication of a branch of the trifacial or facial nerve Later it appeared that in unilateral cases the symptoms could appear on the sound Other explanations were then in order, such as severity of the infection shown by involvement of the submaxillary or sublingual glands, testicle, or pancreas A toxi-infectious labyrinthitis or metastasis to the labyrinth has been invoked. The author now proceeds to analyze a number of cases in his own and others' He has seen nine patients with these ear complications in which lumbar puncture was practised In some of these there were meningeal symptoms which showed that a mild type of meningitis may complicate mumps, and increased intracranial pressure could account for the ver-In other cases there were no meningeal symptoms but a pleocytosis of the cerebrospinal fluid was shown by lumbar puncture One patient presented symptoms (deafness) explained by a slight otitis media, and in another case in which at the time of the disease there was a pleocytosis, deafness on one side became evident at a later period. It is evident that this process, with or without meningeal symptoms, can damage the ear The author concludes that we frequently find disturbances of audition and equilibrium in the course of epidemic parotitis, especially in older children and adults. In opposition

to others the author refers the origin of the same to a serofibrinous meningitis which is part of the general infection. Some support to this view is lent by the results of some experiments by Kermorgant on artificial parotitis in apes. This author also discovered the presence of a spirochete in the ape disease and suggests that the injection of arsenical salts may prove to be of value in the human disease—Deutsche medizinische Wochenschrift, November 25 and December 2, 1927

Metaldehyde Encephalitis - P Wolfer of Zürich in an article on this subject touches on certain collateral problems of interest a tablet for domestic use in Switzerland sold under the proprietary name of "Meta" which is merely an abbreviation of metaldehyde, an isomer of ordinary aldehyde (acetaldehyde) The article does not mention the purpose for which these tablets are used, but they are insoluble in water and have been sold without due caution The victims appear to have been young children who have swallowed tablets or fragments of them, and while the author's patient recovered other cases have ended fatally The encephalitis is manifested by a variety of severe symptoms comprising cyanosis, collapse, tetanoid convulsions, etc., but despite this localization a clean recovery is possible. It had been supposed that metaldehyde, which has long known to be toxic, is changed in the body to acetaldehyde or alcohol and that the pathogenic action partakes of the nature of poisoning by one or the other of Study of the author's and quoted these bodies cases shows that this supposition is quite erron-The minute amount of metaldehyde which is sufficient to set up encephalitis could not give rise to enough alcohol to cause symptoms of any kind and this is probably equally true of ordinary aldehyde Moreover, a close comparison of these symptoms with aldehyde poisoning shows little resemblance, for the latter is usually characterized chiefly by stupor Metaldehyde poisoning is therefore a condition sun generis. The auing is therefore a condition sin generis thor, however, does state that the local action of metaldehyde agrees with that of aldehyde The action of metaldehyde is of considerable scientific interest, for much of the picture suggests strychnine poisoning There are, however, in addition some clonic convulsions noticed between tetanoid crises vulsive element was overcome by opiates and chloral, the collapse state with adrenalin and glucose infusion - Schweizerische medizinische Wochenschrift, November 26, 1927

Possible Danger of the Calmette Protective Vaccination Against Tuberculosis—Professor E Wieland of the Basle Pediatric Clinic asks this question Encouraged by numerous reports from France to the effect that children and even nurslings are being safely and efficaciously immu-

nized, and in view of the fact that this vaccine will soon be in the hands of Swiss practitioners, he is anxiously awaiting the outcome, yet he feels obliged to sound a mild warning by reason of some statements made at a recent session of the German Pediatric Society at Budapest to the effect that von Pirquet had opposed the vaccine because it had been found capable of causing fatal tuberculosis in test animals No attempt is made to dissuade against a trial of the vaccine but it should be made with due regard to this unfavorable animal test. Apparently no one thus far who is qualified to express an opinion has combated Pirquet's statement, but the author, bearing in mind the extraordinary efforts of Calmette over many years to prepare a safe vaccine, is of the opinion that the last word on the subject cannot yet be spoken The problem of the practitioners who are to make use of this vaccine, which is to be furnished gratis, is to satisfy themselves that it will do what is claimed for it, namely, immunize the greater number of children vaccinated, and that it is perfectly Thus far both points are open to doubt, even if slight Concluding, the author states that in his opinion it would have been better to wait a while before turning the vaccine over to the profession at large—Schweizerische medizinische Wochenschrift, November 19, 1927

Anorexia, Colic, and Vomiting in Childhood —Under this title J Brock of Marburg describes attacks or crises of disease in childhood which coincide largely with what is termed cyclic vomiting or recurrent acidosis. He discusses, however, not only this condition but various others which simulate it. In his general summary he refers chiefly to acetonuric vomiting and its treatment As soon as the diagnosis is made we must force the child to eat, which will abort the attack, but if this fail or if we are too late, we must be prepared to treat the secondary consequences, which are a deficiency of water in the tissues and carbohydrate starvation child cannot be made to eat it must receive glucose solution by the rectum or by hypodermo-These children are very suggestible and one can play on their imagination in various ways The threat to repeat the subcutaneous infusion sometimes works as well as the infusion itself Exsiccation may lead to collapse symptoms which require hot bottles and cardiac stimu-The food must be concentrated and given in morsels only-bits of zwieback and butter, or minced white bread and ham However small the amounts and long the pauses, it is possible in this manner to avert the carbohydrate starva-If this kind of feeding succeeds we may

proceed with bulkier and less concentrated food Some recurrence of vomiting may be expected at times and must be met by cracked ice and sips of carbonated water The rectal is the method of choice for glucose infusion In certain cases vomiting is not due to acidosis but is purely neurotic, although the symptoms and secondary results are at times the same, and the treatment is in part along the same lines, the secondary manifestations sometimes making it necessary to interne the patient Separation from the family plus the routine of the hospital often quickly cures these children The author warns that epidemic encephalitis at its outset may be confused with acetonuric vomiting—Munchener medizimsche Wochenschrift, November 25, 1927

Senile Cataract and the Short Wave Light Rays - Prof Birch-Hirshfeld adduces many arguments to answer this question in the nega-It has long been known to experimenters that the ultraviolet rays may be made to produce lens opacities in animals, although the author has never been able to cause them with the pure rays, and the element of electric ophthalmia could not be excluded in his results. Glassblowers' cataract is due to ultrared and not to ultraviolet rays Some support to the ultraviolet theory is suggested by the incidence and early appearance of cataract in India, but other countries in the same latitudes do not show similar incidence, and in polar regions where snow blindness is common and ultraviolet light negligible cataract is not uncommon The fact that excessive light can cause ophthalmia does not imply that light rays cause cataract The author has studied intensively all of his senile cataract material for the past 12 years at the University of Königsberg eye clinic, and has divided the patients into two groups-one comprising shepherds, fishermen, and others exposed to sun glare while the other consisted of those whose vision had been protected against the same. He found considerably more senile cataract in the latter class and in general he could find no support for the actinic ray theory Van der Hoeve, who has been a partial adherent of the latter, has found that another possible result of exposure to the rays is senile degeneration of the macula although the two very seldom coexist thor found that only 6½ per cent of his senile cataract patients presented the other lesion and he is quite unable to understand how ultraviolet rays are able to produce lesions of the retina The hypothesis of Van der Hoeve, that when the rays are harmless to the lens they attack the retina, seems without any support — Deutsche medizinische Wochenschrift, December 2, 1927

LEGAL

By LLOYD PAUL STRYKER, Esq Counsel, Medical Society of the State of New York

THE GOVERNOR'S MESSAGE

One full year has elapsed during which the Medical Practice Act as amended by the Webb-Loomis Bill of 1926 has been in actual working effect. The results of the application of its various provisions are highly gratifying and bespeak the judgment of the medical profession in sponsoring and supporting this legislative measure.

The effect of this act upon the quack and charlatan was decisively demonstrated by the recent report made by Dr Harold Rypins The Grievance Committee created by the bill has also been effectively functioning and has given to both the profession and the public an official body for the fair, just and equitable settlement of numerous

disputes and misunderstandings

This legislation and the reports of operations under it have been the subject of much favorable editorial comment, has been likened by one daily newspaper to the Baumes Laws and characterized as beneficial legislation and a real deterrent force against quacks and charlatans. This legislation would not have been possible except for the hearty sympathy, broad knowledge and keen insight into the matters of public health possessed by the Chief Executive of our state.

The Legislature has recently convened for its annual session and the Governor has delivered his annual address to it on the various problems affecting the state. Of particular interest to the medical profession are his remarks with refer-

ence to public health He says

"Proper attention to the preservation of public health will produce a strong, healthy, vigorous people. There is no greater state asset. We have abundant reason to be pleased with the progress of the state in the last ten years in this field."

There then follows a review of the activities of the State Department of Health In speaking of the Medical Practice Act, the message says

"A part of the duty of the state in the pre servation of public health is the suppression of unauthorized practitioners. Public agitation for drastic amendments to the Medical Practice Act grew out of a conference of the Medical Societies and leaders in public health called in the Executive Chamber in 1923, and after a long struggle amendments to the Medical Practice Act were written into our statute books in 1926. They received nation-wide attention and were favorably spoken of at national conventions of medical authorities. They are proving effective measures of control."

That the medical profession has in our Governor a staunch, true friend and supporter in its fight to better, improve and protect the public health is clearly demonstrated from his message, and his attitude in this matter justly entitles him to the sincere respect and appreciation of the medical profession

Because of the results of the past year, let us not be lulled into a sense of false security, but be ever watchful of any attempt by chiropractors or other quacks and charlatans to force through the present session legislation for their personal benefit, which would be injurious to the public health or tend to nullify or weaken the present Medical Practice Act

You should, therefore, do your utmost to support and uphold the Legislative Committee of the State Society in supporting legislation beneficial to the public health and medical profession and defeat that which may redound to its detriment

CONGENITAL DISLOCATION OF HIP—THROMBOSIS—GAN-GRENE—SUBSEQUENT AMPUTATION OF TOES AND FOOT

When a child had reached the age of thirteen months, her parents discovered that she walked with a slight limp on her right side. The infant was brought to physicians for examination, upon which it was discovered that the child had a congenital dislocation of the right hip, and the parents were then advised that when the child reached three or four years of age, to again seek medical advice and have an operation performed for the correction of the deformity. They were

further advised that more beneficial results in conditions of this nature were obtained when the reductions were made when the child was about three or four years of age

Pursuant to this advice, the mother, when the girl had reached about three or four years of age, again took the child to physicians for examination. The limp had become more marked in the intervening years. Examinations made at that time confirmed the previous diagnosis of a

congenital dislocation of the hip, and the mother was then advised that a reduction of the hip be made and the limb placed in a plaster cast where it would have to remain for possibly several The mother was further told that if medical and surgical steps were not taken at that time for the attempted correction of the deformity, that as time went on it would become more marked, the extent of the dislocation would increase, and the limp would become more pronounced, with an increased shortening of the In spite of this advice, the mother apparently having some fear or dislike for an operation and the placing of a plaster cast upon the child's leg, did not have the child submit to the operative procedure at that time

Years went by, and the child was permitted to walk or run around and play with the other children impeded, at least to some extent, by the dislocation and the limp caused thereby at times complained to her mother of pain and discomfort and of readily tiring, but no medical advice or attention was sought or procured for

the child

When the girl had reached the age of about ten years, and conditions of this nature were receiving rather widespread publicity, the mother again, for the first time in seven years, sought out the physician who held one of these clinics, and had him examine the child and diagnose her condition, and he advised that she have some one He himself, however, renoperate upon her dered no treatment to this child About that time, an X-ray was taken of the pelvic region of the child, which confirmed the diagnosis of a congenital dislocation of the hip of the right side

Shortly thereafter, an operation by the bloodless method for the reduction of the dislocation was performed by a well known and able orthopedic surgeon in the locality where the child re-The leg was put up in a plaster cast following the operation, and the next day an X-ray was taken of the hip, which showed that the head of the femur was not in the acetabulum plaster cast was removed from the leg, and the child kept in the hospital for a few days, and

then sent home

Shortly thereafter, the mother sought the advice of another orthopedic surgeon. He advised the performance of an open operation mother, however, did not consent at this time to that procedure She sought the advice of various other surgeons, and finally consulted an orthopedic surgeon of marked ability. He, too, advised the reduction of the dislocation by means of

an open operation

About ten days later, pursuant to the advice of this surgeon, the child was taken to the hospital, and on the following day, under a general anesthesia, an open operation was performed for the reduction of the dislocation. The limb was then placed in a spica plaster cast extending from just below the umbilious, involving the pelvis and the leg down to and including the foot, but not the toes, the leg being placed in slight abduction Following the operation, the child was in the orthopedic ward of the hospital, receiving the usual good care and attention given at this hos-For several nights, the child was some-However, she bewhat restless and sleepless came more comfortable

There were no untoward events in the child's condition until the seventh day after the operation, when it was noted that the toes of the side that had been operated on had become black and blistered When this condition was observed, the cast was immediately removed from the knee downward, and treatment instituted to relieve the apparent gangrenous condition of the toes days later, the cast was bivalved, and removed from the knee upward Shortly subsequent, the calf of the leg became involved Though every means was used to check the gangrenous condition, it still progressed, and the toes began to The gangrenous condition became such that about a month after the open operation, the four metatarsals were removed from the right The infection had spread to the site of the Subsequent to the removal of operative wound the metatarsals, another operation was performed for the excision of necrotic tissue from the calf of the leg During all of this time, every possible means was resorted to to control and check the gangrenous condition About five months after the original operation, the child was discharged from the hospital

From time to time, for about a year and a half subsequent to her discharge from the hospital, she returned to the surgeon who had operated upon her for examination and treatment her discharge from the hospital, advice and treatment were sought from other physicians child's knee also became stiff, and she received massage, baking, electrical and light therapy twice or three times a week for about two years subsequent to the discharge from the hospital There was no marked improvement in the condition of her leg, other than that the spread of the gangrenous condition had been controlled Again medical advice and treatment were sought for the child, and finally about four years after the open operation for the reduction of the dislocated hip. an amputation was performed, and the foot and leg about midway between the ankle and the knee The child was fitted with an arwas removed tificial foot

About two years after the open operation, the father of the child instituted an action against the surgeon seeking to recover for the loss of his daughter's services, and for moneys expended by him in the care and treatment of his child this action it was charged that the defendant surgeon was negligent in that he put the head of the dislocated femur in the old socket which was too shallow to hold the same, and that he should have built another socket higher up on the pelvis, and

that by placing the head of the femur in the old socket, he stretched the blood vessels of the limb too much, causing the same to rupture, and setting up the gangrenous condition, with the ultimate loss of the toot and part of the leg

When this action came on for trial, the girl then about sixteen years of age, in testifying in the action, presented a pathetically sympathetic figure, and told how prior to the operation she had been able to run and skip and jump the way other girls did, but that now she has to go about on an artificial limb She told too of the numerous treatments she had received and the various operations which had been performed timony was substantiated and somewhat reinforced by the testimony of her mother

The plaintiff's attorney then sought by an Xray technician to have him interpret the various X-ray films which had been taken of the child at various times, and to have him testify that the acetabulum on the right side was shallow and not as deep as that on the left, not as deep as the natural acetabulum and too shallow to hold the

head of the dislocated femur. Any expression of opinion by this witness was objected to, and the objection sustained on the ground that he was not qualified to express an opinion On crossexamination of this witness, it was shown that the X-ray films that he was examining were merely shadows, and that from a visual inspection of them one could not tell the depth of the acetabu-He was practically completely discredited on cross-examination, and gave no testimony that any act of the defendant surgeon was the cause of this child's suffering injury There was not produced on behalf of the plaintiff any physician to give testimony as an expert that the defendant did not follow the proper and approved practice, or that any act of his was the competent producing cause of the bad result complained of

The plaintiff then resting his case, a motion was made to dismiss the complaint on the ground that the plaintiff had wholly failed to make out any cause of action The trial court granted the motion, thus terminating this action in the defend-

ant's favor

POST-PARTUM HEMORRHAGE—PLACENTA PRAEVIA—DEATH

A physician was called to the home of a patient and found her in labor An examination disclosed that the fetus was apparently Attempts were then made to deliver the fetus with forceps which, however, slipped from the head of the fetus. The defendant, upon arrival, seeing the condition of the patient, immediately called another physician to assist him and to administer the anaes-The second physician likewise attempted to remove the fetus with forceps, but was unsuccessful Chloroform anaesthesia was then administered and a version performed by the first physician, the fetus being delivered feet first The fetus was dead when delivered The placenta not being spontaneously delivered the defendant then attempted to do a manual delivery of the placenta, but in attempting to withdraw the placenta the uterus came down This he immediately replaced and after about ten minutes further effort he succeeded in delivering the placenta. Both physicians remained with the patient until she had completely come out of the anaesthesia hypodermics of strychnine were administered to the patient. The physicians remained in

attendance upon this patient for a period of about six hours

When the first physician called upon the patient on the following day he found her heart action weak and administered a hypodermic of strychnine and digitalin mained with the patient about three hours, using every effort and means to resuscitate and revive the patient, but she died while the physician was exerting his efforts to revive The death certificate was prepared by the defendant physician and filed with the health authorities, the cause of death being given as post-partum hemorrhage, contributory cause placenta prævia

In a malpractice action against the physician who was first called it was charged that he was engaged to attend and treat the patient in her expected confinement and to deliver the expected child, that because of his failure to use proper care and skill in his treatment of the expectant mother, she was caused injuries which resulted in her death

During the pendency of this action the defendant physician died, thus causing the action to abate

NEWS NOTES

LEGISLATION

The following Bulletin was issued January 11th by the Committee on Legislation

"With this Bulletin we begin the legislative season. The Public Health Committees in the Senate and Assembly have been announced. In the Senate there will be one change, Senator Hastings has been selected to succeed Senator Carroll who died. Eight of the thirteen members of the 1927 Assembly Committee have been continued for this year. Of the five new men on the Committee, three were members of the Assembly last year and two have been elected for the first time. The personnel follows.

Senate Committee

Name	Residence	Occupation
Webb	Hyde Park	Farmer
(Chairman		
Baumes	Newburgh	Lawyer
Thayer	Chateaugay	Manufacturer
Mastick	Pleasantville	Lawyer
Hickey	Buffalo	Lawyer
Wicks	Kingston	Laundrying
Love	Brooklyn	Physician
Kennedy, M J	New York City	Real Estate
Hastings	Brooklyn	Broker

Assembly Committee

Name	Residence	Occupation
Lattın	Albion	Physician
Chairman		
Esmond	Ballston Spa	Lawyer
Austin	Spencerport	Pharmacist
Loomis	Sidney	Physician
Van Cleef	Seneca Falls	Farmer
Bernhardt	Buffalo	Retired
Edmunds	Cohocton	Real Estate
Van Alstine	Weedsport	Dentist
Gimbrone	Buffalo	Pharmacist
Cline	Brooklyn	Real Estate
Doyle	Brooklyn	Mercantile
Reidy	New York City	Lawyer
Streit	New York City	Lawyer

"Several bills have already been introduced that claim our attention Mr Vaughan has reintroduced his anti-vivisection bill (See Assembly Int 885 of Feb 9, 1927, among your last year's bills), which will be known as Assembly Int No 33 Assembly Int No 83 (As Int. 1625 of March 3, 1927) and No 84 (As Int 938 of Feb 14, 1927), are Mr Esmond's chiropractic bills of last year No 83 would amend the Education Law by introducing sections 1275 to 1290, which would provide for the practice of chiropractic, outlining a course of study, establishing an examining

board and providing waiver clauses The bill is just as objectionable this year as it was last and will receive our hearty opposition. In his bill No 84, Mr. Esmond endeavors to amend the definition of the practice of medicine by making exceptions that would govern the practice.

tions that would cover chiropractic

"Assembly Int No 102, by Mr Gedney, which would make reasonable fees of physician for examining persons charged with intoxication in operating motor vehicle or otherwise at time of commission of crime, a town charge, was also introduced by him last year. It passed the Assembly, but died in the Senate Internal Affairs Committee. Mr Gedney is personally very eager to have the bill become a law, he thinks a great injustice is done physicians by having them appear as witnesses in cases of this character and allowing them only the ordinary witness compensation fee.

"Senate Int No 99, by Mr Brown, would amend section No 78, Mental Hygiene Law, by providing that the commissioner may permit authorities of a psychopathic ward of a general hospital to detain a person under observation as to sanity for an additional thirty days on written request of such person or one competent to petition therefor

"There is enclosed, for your information, a

copy of the Clerk's Manual

"May we suggest, since there is likelihood that the legislative session this year will be short and snappy, that you read the bills promptly as they are received and give us your suggestions immediately? No bills are printed now, but with the next Bulletin we shall send such as may be available

BULLETIN OF JANUARY 17th

The chiropractors are not asleep by any means, on the contrary they have taken courage in believing that the change in the Department of Education may be to their advantage. We are confident that their hopes will be short lived

Assembly Int. No 139—Mr Phelps has introduced a compensation bill which would make all disabling diseases and disabling illnesses contracted in the occupations now included by law, as compensable. For the last several years efforts have been made to increase the number of compensable diseases and illnesses encountered in certain industry. There has been a great deal of opposition to these laws both from the carriers and industry, but backing the bills are powerful welfare organizations and women's clubs.

Assembly Int No 156—Mr Jenks has reintroduced the osteopath bill The new matter reads

as follows (Old matter in Roman type, new in italics)

"A license to practice osteopathy shall not permit the holder thereof to administer drugs or perform major surgery with the use of instruments, provided, however, that no osteopath, duly licensed without examination prior to November thirteenth, nineteen hundred and seven, shall be permitted to practice surgery as aforesaid, unless he or she shall pass the regular medical examination in surgery under such terms as may be prescribed by the department Notwithstanding the foregoing provisions, a person licensed to practice osteopathy may use in the treatment of patients the following therapeutic agencies cotics for the relief of suffering by administration but not prescription, antiseptics, vaccines and antitorms"

The Pennsylvania legislature has appointed a commission of legislators and laymen to investigate cult practice in Pennsylvania They held a hearing in Philadelphia in December and another

is planned for for Pittsburgh this month, to be followed later by one in Scranton. The chiropractors there are seeking an examining board of their own, because they are licensed in that state, but the physicians are championing a single board such as we have here

Ohio, at the last election in November, took a referendum vote as to whether special legislation should be enacted for the purpose of licensing chiropractors. The vote was lost by over 600,000

majority

The New Jersey State Society is endeavoring to arouse interest in the enactment of a registration law such as New York and Pennsylvania are now working under Through the influx of unlicensed practitioners from these two states, they are reaping the disaster of non-registration

HENRY L K. SHAW, GARRET W TIMMERS, HARRY ARANOW,

Committee on Legislation, Medical Society of the State of New York

THE ANNUAL MEETING OF THE STATE SOCIETY

The annual meeting of the Medical Society of the State of New York will be held in Albany beginning on Monday, May 21, 1928, with a meeting of the House of Delegates, and ending on Thursday, May 24th, with a scientific exhibit

The Committee on Scientific Work announces that the program for the scientific sections is well past the tentative stage

There will be meetings of all sections on Tuesday afternoon and all day Wednesday

The Society's Joint Meeting, with a very attractive program, will be held in conjunction with the Annual Banquet on Tuesday evening

On Wednesday evening there will be a Joint Meeting of all the sections, presided over by the

President of the Society, at which exceptional papers of outstanding importance will be presented. These papers will deal with the trend of medical practice, the economic aspects of medical practice and various features of the Workmen's Compensation Law which affect the entire profession. The subjects will be presented by men who have made intensive studies of these tonics.

Thursday will be devoted to an exhibit on "Cardio-vascular Disease"

The members of the Society are urged to make arrangements to attend these sessions

Samuel J Kopetzky, MD, Chairman of the Scientific Committee

JEFFERSON COUNTY

The regular monthly meeting of the Jefferson County Medical Society was held on January 12th at the Jefferson County Golf Club, with 41 members present. The program consisted of a paper on and a demonstration of the electrocardiograph

by Dr George F Bock of Watertown It was discussed by Dr George S Nellis of Watertown The members dined in a social dinner at 6 30 o'clock

W S ATKINSON, Secretary

WAYNE COUNTY

A meeting of the Wayne County Medical Society was held in Lyons on September 21, 1927, with the president, Dr W H Sweeting in the chair

Dr James E Sadlier, President of the Medical Society of the State of New York, gave an address on the functions of a county medical society (This is printed on page 135)

Dr W D Johnson of Batavia gave an address on the surgery of the handicapped patient

Dr F R Wright of Clifton Springs spoke on fallacies about diabetes He first touched upon the old fallacies of the earliest definite plan of treatment for diabetes and told how, at one time, the strict carbohydrate diet was tried, and then the non-carbohydrate diet Then he called attention to a large number of fallacies which have been in existence for a long time and which are still brought to the doctor's attention by the questions which the patients ask him These, both old and new fallacies, cover such subjects as the different foods, misunderstandings in regard to the significance of sugar in the urine, and the effort of the patient to maintain his body strength

The speaker dwelt upon the causes of diabetes and made a plea for more autopsies in order that the profession might have a better understanding of just what changes have taken place in the pancreas of the diabetic. His closing remarks emphasized some very recent fallacies regarding the use and abuse of insulin

Dr E W Phillips of Phoenix, Arizona, gave a brief address on tuberculosis in Arizona (This address is printed on page 139 of this JOURNAL)

EDITOR'S NOTE The secretary of the Wayne County Medical Society sent a typed copy of the stenographer's notes of the meeting and thereby set a commendable example which other secretaries might follow

GREENE COUNTY

The regular quarterly meeting of the Greene County Medical Society was held on January 10th in the Saulpaugh Hotel, Catskill The scientific session was preceded by a most enjoyable dinner at which twelve members of the Society sat down together with Dr John Sampson, Professor of Gynecology at the Albany Medical College and Dr Frank Laidlaw, District Health Officer

Dr A O Persons of Lexington, President of the Society, was in the chair, and the following members were present Drs Daley, Branch, Willard, Goodrich, Waller, R E Persons, Van Hoesen, Rapp, Atkinson, Sinclair, Honeyford and Cooper

Dr Branch, chairman of the committee appointed to appear before the Board of Supervisors reported that they were very gracefully received but that no action was taken by the Board at that time

Dr Atkinson then introduced Dr Sampson, who spoke on pelvic infections, and gave a most interesting and instructive talk, conveying a number of very important points for the general practitioner to remember A general discussion followed to the great advantage of all Dr Daley moved that a rising vote of thanks be given Dr

Sampson Seconded by Dr Van Hoesen and carried

The matter of recommending three members of the Society to the Board of Supervisors for appointment to the Public Health Nursing Committee was then taken up Dr Rapp told of the present status of the matter up to this time. A general discussion followed

Dr Honeyford made a motion that Society recommend the following doctors to the Board of Supervisors, Drs Rapp, A O Persons and Van Hoesen Seconded by Dr Daley and carried

Dr Honeyford, Chairman of Committee on Hospital, reported that the Hospital Board had a meeting last night and that they were getting ready for a drive in August for additional funds

It was moved by Dr Daley that the Secretary be instructed to ask for a post-graduate course on circulatory diseases Seconded by Dr Atkinson and carried

Dr Laidlaw expressed his appreciation of the co-operation given by the Society in the Public Health Nursing proposition

The minutes were then read and approved and adjournment taken to the next regular meeting in May

W M RAPP, Secretary

DUTCHESS-PUTNAM

The Poughkeepsie Academy of Medicine following the example of the Watertown Academy, has united with its County Medical Society Hereafter the Dutchess-Putnam Medical Society will perform the functions of the Academy of Medicine It will meet monthly and its membership will be that of the County Medical Society

Poughkeepsie, like Watertown, is the natural meeting place for the whole county, commercially,

politically and socially, as well as medically The automobile has brought all parts of Dutchess and Putnam counties within easy riding distance of the city, and rural physicians can attend the meetings as readily as their urban brethren a generation ago. It is expected that the entire membership of the county medical society will keep in better touch with the many activities of the organized profession and make our County Society a factor for greater usefulness than heretofore

The Poughkeepsie Academy of Medicine was organized in September, 1905, the object at that time was to draw in closer contact the physicians practicing in our city, and make them a unified orce in promoting health and welfare measures At the same time it was hoped that the social element would eliminate many existing sources of unpleasantness The Academy was most successful over the twenty-three years of its existence in promoting better health conditions in our Its Milk Committee did much to procure for us a cleaner and safer milk supply physicians from the membership were induced to take positions on the Board of Public Works and as a result succeeded in eliminating the waterborn typhoid fever which had been in existence to an alarming extent for many years Several epidemics of diseases affecting this community were better handled by reason of the closer relationship between physicians and their unified sup-

port in matters appertaining to Public Health Meetings were held monthly and much scientific work was done These meetings were frequently addressed by men of national reputation. Our Academy of Medicine was very forceful in stabilizing the medical profession, increasing their knowledge and uniting their efforts Developed as it was twenty-three years ago when roads were bad and access to the different points of the county rather difficult, it seemed wise then that we should have this local organization, but now with good roads and better method of transportation, physicians from the distant points of the county can easily get together and the local Academy is no longer required, for in its place we will have monthly meetings of the Dutchess-Putnam Medical Society and carry on in a proper way the various activities which should belong to it

JAMES E SADLIER

GRADUATE EDUCATION

District conferences have been instituted by Dr Thomas P Farmer, chairman of the committee on Public Health and Medical Education The first conference was held on January 4 in Binghamton with representatives of the medical societies of the counties of Broome, Cortland, Tompkins, Tioga and Chemung As a result of this conference, plans are being formulated to start a course in physiotherapy early in Tompkins County Courses in internal medicine are being planned for Chemung, Tioga and Cortland Counties Broome County is considering plans for a course, which, however, may not be held until next fall

A conference was held on January 11 in Albany with representatives of societies of the counties of Albany, Schenectady, Saratoga, Greene, Fulton, Otsego and Schoharie Messages were received from Columbia and Montgomery Counties As a result of this conference, tentative plans are being arranged for courses in internal medicine in Albany, Fulton, Otsego and Schoharie counties, and a course in heart disease in Saratoga and Greene Coun-

ties, and one in neurology in Montgomery County, a course in physiotherapy or endocrinology in Columbia County is also planned Schenectady County still has the matter of a course under advisement

In addition to the above, courses are being arranged for St Lawrence and Jefferson Counties on heart disease and diseases of the blood, also Allegany County on obstetrics

The committee now has fifteen counties in which courses are definitely planned for this spring, and can only take care of a very few more counties. The limitation is not due to the matter of expense, but to the fact that the hands of the committee will be full in doing the work already planned.

Dr Farmer has appointed the following subcommittee to study county health units Drs E MacD Stanton, G F Chandler, C J Longstreet Dr Thomas P Farmer, chairman

Dr Farmer also appointed Drs George W Kosmak and John O Polak as his associates on a subcommittee to study the puerperal death rates in urban and rural districts

THE NEW YORK ACADEMY OF MEDICINE

The officers, trustees and fellows of the New York Academy of Medicine wish to extend its courtesies to physicians who are visiting New York, and especially to the members of the Medical Society of the State of New York When plans for moving the Academy to a new site were under consideration, its

President, Dr George David Stewart, wrote "The Academy—if its building and its resources permitted—would gladly extend a medical hospitality to individual physicians or to visiting medical societies that wish to hold sessions in New York City In a word, the function of an academy of medicine in the

city of New York contemplates not simply the facilities of a great library and the stimulation to the profession arising from interesting lectures and from fruitful sectional meetings, but it aspires to become an effective center in the greatest city of the new world for those activities of medical men and of medical associations which are not now able to find in any one place either the information necessary for their right conduct nor yet the sort of welcome which the medical science of one continent should extend to the medical representatives of every other continent."

The Academy has now occupied its new building for over a year and has developed its functions and personnel to a point where it can extend the medical hospitality which Dr

Stewart planned

The facilities which the Academy offers to medical visitors may be described under four heads

1 General hospitality

2 The Library

3 The Bureau of Clinical Information

4 The meetings

The Academy offers its facilities as the headquarters for visiting physicians and their famlies where they may have their mail addressed, meet ther friends, receive and make telephone calls, and even obtain a modest lunch in the dining room that is maintained for the While the Academy is not a club employees house, yet visiting physicians will find themselves among cordial friends who will lend their advice and assistance. As the visitor enters the building, he will find an information room at his left, where he will be received and instructed If he, or any member of his family wishes to rest or wait, he will be shown into the reception room across the hall

The visitor is welcome to the privileges of the library, which is located on the third floor As he enters the rooms, an attendant at a desk on his right will explain the facilities of the library and direct him how to use them He will find current numbers of most of the medical literature of the world on the shelves, and he can obtain any book by applying at the desk. If he wishes to study research work in medical literature, the attendant will explain the card index system and will get the volumes for him. If he wishes an illustration copied it will be done on the photostat apparatus for a small fee. Every kind of service of a medical library will be at the visitor's call

A Bureau of Clinical Information is conducted by the Academy in room 61, on the sixth floor. The Bureau offers detailed information regarding opportunities for graduate medical study in New York and other cities of the United States and Canada, and in European centers. The Bureau has prepared a guide in which the opportunities for clinical study in the hospitals of the city are listed and described. It also publishes a daily bulletin of medical and surgical clinics of the city.

Here also the inquiring visitor will find applications of those seeking professional opportunities, as well as offers of such opportunities to qualified medical men and women. Here too one may obtain information regarding all phases of medical matters such as the location of stations of the Board of Health and how to

get a patient into a hospital

The Academy also offers visiting physicians the courtesies of its meetings Besides the two stated meetings of the Academy held each month there are monthly meetings of the twelve different groups of Fellows organized into sections devoted to various branches of medicine and surgery and to historical and cul-These stated and section tural medicine meetings are open to all physicians and to medical students. In addition to these meetings many medical societies of the city hold their meetings at the Academy There are usually one or more meetings held at the Academy each night of the month except Sundays and holidays

The Academy is located at Fifth Avenue and One Hundred and Third Street, New York, and may best be reached by the Lexington Avenue subway to the One Hundred and Third Street Station, or by the Fifth Avenue Bus line Its tele-

phone number is Atwater 4700

MEDICAL WARES

WINDOW GLASS

The necessity of sunlight in the growth of plants and animals is well known. The basic act, or starting point, in the creation of living matter out of earth, air, and water is that of chlorophyll,—the green matter of leaves—in making starch out of water and carbon dioxide. Without sunlight all the vailable carbohydrate would soon be exhausted, and life would cease because of lack of material to sustain it.

Sunlight is equally necessary in the growth of lower animals and human beings, for it has a controlling effect on the utilization of calcium compounds. Research points out the probability that sunlight affects the cholesterol of the skin, and makes it potent in promoting the utilization of calcium compounds. (See the Journal of the A. M. A., December 29, 1929, p. 2196.) A child does not grow normally if it does not receive rays of sunlight on its skin or eat substances which have been subjected to the rays.

The anti-rachitic properties of sunlight he in the ultra-violet part of the spectrum. Wave lengths of light are expressed in angstrom units, one of which is one ten-millionth of a millimeter. The visible rays of sunlight have wave lengths running from 7200 angstrom units for the red to 4000 for the violet. Still shorter rays form the ultra-violet portion of the spectrum, which is visible to the human eye. The ultra-violet spectrum is arbitrarily divided into three portions.

1 The near, extending from 4000 angstrom units to 3200. These rays are not effective in preventing rickets.

2 The middle, extending from 3200 to 2750 angstrom units. These rays are anti-rachitic and produce a tanning effect on the skin

3 The far ultra-violet rays are those having wave lengths less than 2750 units. These have a more intense effect than those of longer waves. They exist in the light given off by the sun, but they do not penetrate the denser layers of the atmosphere. They are abundant in the light produced by ultra-violet lamps.

Ordinary glass transmits a large proportion of the near ultra-violet rays, including those which affect photographic plates and promote the growth of plants, but it does not transmit the middle rays. The light of an ordinary greenhouse, for example, will not prevent animals from developing rickets, although it will enable plants to grow normally. But in recent years glass and other substances have been invented which can be used as windows that will transmit the anti-rachitic rays of sunlight. The first of these substances to be put to practical use was quartz, which is transparent to all the ultra-violet rays that are

used therapeutically, but its cost is great and its use is limited to "quartz" lights for the production of therapeutic rays of the shorter wave lengths. The Journal of the American Medical Association for May 14, 1927, page 1562, contains a report on an investigation of the anti-rachitic properties of practically all the various kinds of window materials on the market

Much original research into the optical properties of glass has been made by Mr F E Lamplough in the laboratories of Chance Brothers, glass manufacturers, in Birmingham, England This company produces a window glass, called by the trade name of vitaglass, which transmits 50 per cent of the middle ultra-violet rays which fall upon it The Journal of the A M A credits this glass with a high efficiency in the prevention of rickets. The glass has the appearance and building qualities of ordinary glass, and its cost is from four to eight times that of ordinary glass. It is especially valuable in children's nurseries, schools and hospitals

A German product, called helioglass, resembles vitaglass closely, and is also available in the open market

A peculiar glass, called corex, has been made by the Corning Glass Works, of Corning, New York, for two years This is transparent to the middle ultra-violet rays, but its present physical limitations prevent its practical use on a wide scale

Cellulose acetate is also adapted to use as windows. One form called celoglass consists of thin sheets of the cellulose acetate supported on a frame work of wire mosquito netting. It is especially well adapted for use as windows of chicken houses. It transmits about 20 per cent of the middle ultra-violet rays that fall upon it, but this amount is sufficient to promote the growth of young chickens.

The thin celluloid material called celophane, which is used for wrapping sausages, also transmits the ultra-violet rays of the sun

Some of the paraffines also transmit a portion of the middle ultra-violet rays. A product, called flexoglass, consists of a thin woven cloth impregnated with a peculiar paraffine. It transmits a small proportion of the middle ultra-violet rays, but yet enough to have some anti-rachitic effects on chickens.

Both flevoglass and celoglass are cheap, and may be bought in rolls of any length. Their limitations are the difficulty of cleaning dust from them and their lack of durability, but these defects are offset by their cheapness and the ease of their installation.

THE DAILY PRESS

DEATHS CAUSED BY AUTOMOBILES

The State Department of Health is sponsor for a health talk Friday evenings broadcasted from the General Electric Company's station in Schenectady, N Y They are also sent to the newspapers as news releases on the following morning. The talk for December 3rd was by Dr Matthias Nicoll, State Commissioner of Health. Following a brief comment on the announcement of a new model of a popular make of automobile, that it will go 60 miles an hour, he said

"There is only one reason for advertising this feature—that is to sell more cars. In other words, many people are going to purchase this machine largely on account of its speed. Now what does that mean—just so many thousands more death-dealing vehicles on

our highways

"In the first nine months of this year one thousand six hundred and sixty-six lives were snuffed out in this state by automobiles, and more than one-quarter of this appalling total were children. In addition more than 61,000 persons were injured. Railroad accidents, on the other hand, caused only 366 fatalities and street car accidents resulted in only 90.

"This large number of deaths due to automobiles exceeded the combined total of deaths in this state caused by typhoid fever, smallpox, scarlet fever, infantile paralysis, measles and diphtheria If tomorrow I should tell any one of the parents listening to me tonight that one of these diseases was epidemic in his community, he would immediately take every precaution to protect his children, yet how many of you appreciate that the speed epidemic which is constantly before your eyes is far more likely to kill your child than one of the communicable diseases What does it avail the State of New York and all of the cities, towns and villages to spend large sums of money to prevent disease only to have the people killed by automobiles

"Analysis by the State Motor Vehicle Bureau of the reasons for accidents shows that the two greatest causes of fatal accidents were exceeding the speed limit and driving off the roadway. Perhaps the drivers in the latter instances were not exceeding the legal speed limit, but this does not signify they were not going too fast under the particular conditions confronting them. There is usually no reason for a car going off the road unless the driver is proceeding at an improper speed.

"Speed, speed, and yet more speed! This is the day for speed and now one manufac-

turer is quoted as saying that he won't be satisfied until a family of six owns six cars—and his cars can go 55 miles per hour

"I don't mean to say that there is not often contributory carelessness on the part of the pedestrian There is, but remember that of those killed and injured this year from January 1st to September 30, 25 per cent were children and children cannot be expected to be careful

"Railroad engineers are required to pass rigid physical examinations before employment, and they drive locomotives running on tracks with a well defined right of way they rarely exceed a speed of 50 miles an On the other hand, despite all the efforts of the state to prevent it, many are driving automobiles today who are physically unfit The thorough examination of the hundreds of thousands of applicants for drivers' licenses is a practical impossibility, but every such applicant is required to swear to a statement that he is physically competent perjury seems to mean little to many people. and repeated instances of licensed drivers afflicted with heart disease or epilepsy have come to the attention of the State Motor Vehicle Bureau and in every such case the license has been revoked Both of these conditions are easily concealed and it is virtually impossible to discover them if the applicant wishes to hide the facts Any one knowing of a motor vehicle operator who suffers from any disabling physical affliction should immediately notify that bureau giving full information of the facts in order that an investiga-. tion may be made Such persons imperil the lives of thousands of people every day

"Many of those listening to me tonight are drivers Just a word of warning to you—the State of New York cannot permit the wholesale slaughter of innocent lives to go on Unless you wake up to the situation and drive at conservative speeds, I predict the time will come when every car in this state will be equipped with a governor to prevent a speed greater than 20 miles an hour. When that time comes, you'll all protest that the just are being made to suffer for the sins of the unjust, but the only way I can see of forestalling this action by the state is through the force of public opinion in creating a demand for less speed and greater care. No longer can the Empire State countenance the loss of 6 lives and the maining of 225 persons

every day"

COLDS

The New York *Times* of January 9 makes the following editorial comments on announcement of The New York City Department of Health regarding the prevention of colds

"Commissioner Harris's announcement that respiratory diseases are at their lowest is, of course, welcome He couples it with the timely injunction not for this reason to avoid taking the necessary

precautions to check incipient colds

If only this good health record could be directly connected with the development of preventive hygiene to control the spread of the common cold, we should be able to record a new and great achievement of medicine. The public is slowly beginning to realize that colds can be avoided, but that if this is to be done, they must no longer be treated as unavoidable and non-transmittable."

The same editorial page has another editorial entitled "Our interest in health" in which the writer says concerning speakers at a conference

on preventive medicine

"They presupposed the active approval of the public in the work they are doing" This means simply that doctors cannot carry out preventive

measures any faster than the people will follow hygienic advice. The people are by no means ready to follow the measures which will prevent colds. Physicians teach the contagious nature of the common cold, but they are unable to recognize its specific germ or to prescribe a special vaccine or serum or drug or procedure that will overcome it. Yet the oldfashioned measures of isolation and quarantine are still effective in preventing the spread of colds of all forms. However, the people almost unanimously would resent an official quarantine of cases of colds, and only a few observe the voluntary isolation of colds, even the campaign to "cover coughs and sneezes" has had little effect on the public."

The people are surfeited with commonplace advice to keep the feet dry and to avoid drafts. They need to hear the positive teaching that colds are contagious and that the time to take preventive precautions is in the incipiency of the cold. The prevention of colds depends on education in personal hygiene and personal ethics, and that is a slow process.

SECRETS OF PATIENTS

The French law follows that of New York in regard to the revelation of a patient's secrets by a physician A Paris physician was fined 500 francs for giving information in aid of a husband who was seeking a divorce from his wife. The wife brought suit against the doctor for revealing a professional secret improperly, and won her case, although the doctor claimed that the facts were

already known The court ruled, according to the New York Times of January fourth

"The obligation of silence is incumbent on a doctor even when the facts are known. A doctor receiving confidences from a patient, by that fact becomes obligated not to repeat them, nor in any way confirm or authenticate to others what has been told to him."

THE TIN CAN AND FAMINE

It is impossible to choose the invention which is the most essential to the human race, for anything that is essential cannot be spared. The tin can is much more than a convenience,—it is essential to the happiness and well being of a great part of the human race. What the tin can has done for civilization is told in an editorial in the New York Herald Tribune of August 21, from which the following extract was taken

"Virtually no one starves to death today as millions starved annually not so many generations ago Freedom from famine is a gift, quite largely, of the tin can It is not enough that food-stuffs be sufficient, they must also be preservable between harvests That is why grain was so long the staple Barring mice, damp and weevils, grain will keep Nowadays everything will keep—inside the tins Neither mouse nor mold can force its way within "

Cold storage also is essential in the preservation of food, but it must be done on a large scale. The tin can goes into every household, and is an ever present symbol of man's conquest of the malevolent forces of nature.

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review as dictated by their merits or in the interests of our readers.

- Tonic Hardening of the Colon By T Stacey Wilson, MD Octavo of 210 pages London and New York, Oxford University Press, 1927 (Oxford Medical Publications)
- FEDERAL HEALTH ADMINISTRATION IN THE UNITED STATES By ROBERT D LEIGH Octavo of 687 pages New York and London, Harper & Brothers, 1927 Cloth, \$500
- AMERICAN MEDICINE AND THE PEOPLE'S HEALTH AN Outline with Statistical Data on the Organization of Medicine in the United States By Harry H Moore Octavo of 647 pages, illustrated New York and London, D Appleton and Company, 1927 Cloth, \$500
- OUR TIMES The United States, 1900-1925 II America Finding Herself Ry Mark Sullivan Octavo of 668 pages, illustrated New York and London, Charles Scribner's Sons, 1927 Cloth, \$500

BOOK REVIEWS

Modern Medicine. Its Theory and Practive in Original Contributions by American and Foreign Authors Edited by Sir William Osler, Bart., M.D. Third Edition, thoroughly revised Re-edited by Thomas McCrae, M.D. Assisted by Elmer H. Funk, M.D. Third Edition, revised Volume 5. Diseases of the Read Diseases of the Livebette Section Description. Blood—Diseases of the Lymphatic System—Diseases of the Ductless Glands—Diseases of the Urinary System-Vasomotor and Trophic Disorders-Diseases of the Locomotor System. Octavo of 948 pages, illustrated. Philadelphia, Lea and Febiger, 1927 \$9 00

Volume V maintains the high standard of those preceding it in this third edition of Osler's Modern Medicine. McCrae and Funk have done their re-editing well.

The first part is devoted to diseases of the blood. Cabot's contributions on general pathology of the bloodforming organs, and the anemias and leukemia are thoroughly abreast of present-day opinion. The increasing infrequency of chlorosis is noted and the disease is spoken of as "nearly extinct" Pratt writes on purpura and hemophilia, and presents a classification of purpura modeled on that of Leschke. Duke's bleeding time estimated mation is carefully described and its value emphasized. The article on anaphylactoid purpura (Schonlein-Henoch disease) is complete and stresses the importance of careful consideration of all visceral crises. Splenectomy is recognized as a treatment of striking success in thrombopenic purpura. Differentiation from aleukemia leukemia is not mentioned by Pratt, but later on in the volume (p 175) Krumbhaar refers to it, and considers the identification of immature cell forms as of great value, since in such a case splenectomy is contraindicated. He reports rapid death as a sequence of inadvisable operation, as does Nathan Rosenthal of New York.

Krumbhaar's section of 50 pages on diseases of the

spleen is splendid, as always

Harold Jones has prepared a short chapter on blood transfusion, with a description of Jansky's and Moss' groupings. He is conservative and warns against the use of this method in acute fulminating septicemia. The paragraphs relating to the transfusion treatment of pernicious anemia are due to be rewritten in the light of the Minot-Murphy diet, to which Cabot makes slight but adequate reference on page 57

Warthin and Longcope write respectively on diseases

of the lymphatic glands and Hodgkin's disease.

160 pages are devoted to chapters by Dock and Lisser on diseases of the adrenals, pituitary, pineal, thyroid and parathyroids. It is to be noted that they do not advise dropping digitalis from the treatment of failing thyroid heart. Lugol's solution receives thorough consideration and the prevailing view that its use should be confined to preparing patients for operation is emphasized chapter on diseases of the thymus gland is by Warthin

Part IV is devoted to diseases of the urinary system and the contributions are by the late John McCrae, Rowntree, Garrod, Thomas McCrae, O'Hare, T R. Brown and Young Classification of diseases of the kidney is always an interesting subject to the internist That used by O'Hare is a modification of Vohhard and February That the magnification of the contraction of the co Fahr's The term nephrosis therefore appears frequently the condition is limited to tubular degeneration and the sub-groupings are the nephrosis of pregnancy, that of bichloride of mercury poisoning and lipoid nephrosis

Vascular hypertension is splendidly discussed in the pages devoted to the scleroses of the kidney, of which the concluding 14 pages are devoted to chronic nephritis with hypertention, a disease "in no sense limited to the

kidney alone"

The fifth division of the volume is devoted to vasomotor and trophic disorders. The chapters on Raynaud's disease, Quincke's disease, scleroderma and erythromelaigia are revised by Malloch

In the concluding chapters on diseases of the locomotor system, Thomas McCrae gives a fine account of arthritis He again warns against enforced confinedeformans ment indoors, deprivation from protein, prolonged hot baths and large doses of salicylates

The reviewer is glad to see the term fibrositis appearing in American literature, although the three-page dis-

cussion in this volume seems rather brief

Osteomalacia, achondroplasty, Paget's disease and related diseases close the volume FRANK BETHEL CROSS

Baltimore, The Williams and Wilkins Com-1927 Cloth, \$2 50 (Medicine Monographs, Hypotension pages pany, 1927

Volume XIII) This is one of the excellent series which originally ap peared in the periodical, Medicine, and like its predeces sors presents a thorough review of its subject. Hypotension is studied in relation to the various factors which ordinarily maintain normal blood pressure. No single cause has been found to explain diverse types of hypo In adults, below 110 mm systolic pressure is considered to be hypotension by the majority of writers The force of the cardiac contraction, the peripheral resistance to the blood stream determined by the vasomotor system, and the blood volume are believed to be the most important factors in maintaining the blood pressure. These are of more importance than the conditions of the state of the stat dition of the vessel walls

Acute hypotension is considered to be "part and parcel" of traumatic anaphylactic and anesthetic shock, as the loss of blood volume can be compensated only to a limited degree by contraction of the vessel walls. The work of Cannon on traumatic shock is discussed at length Escape of plasma into the tissues, hemorrhage, cold and exposure may be factors in the production of marked hypotension. Undue anxiety and dread of op eration through the nervous system may be factors in the production of primary shock and tissue trauma, handling of the abdominal viscera and anesthesia, factors in surgical shock.

In the treatment of wound and surgical shock, drugs are considered generally to be of no value and the best measures those which increase the amount of circulating fluid, fluids by the usual methods of administration and especially blood transfusion. This is believed to be of the greatest value in dealing with low blood pressure whether due to hemorrhage alone or shock.

Hypotension in relation to acute and chronic diseases and the actions on the blood pressure of tissue and glandular extracts as well as drugs are studied in detail A general summary and full bibliography conclude the book which is the best so far to appear dealing with this subject.

W. E. McCollom

LIPPINCOTT'S POCKET FORMULARY By GEORGE E. REM-BERGER, M.D. Narrow octavo Philadelphia and Lon-Cloth, \$3 50 don, J B Lippincott Company, (1927)

This little book, convenient in size for the pocket, is a valuable reference manual for the general practitioner in the therapeutic management of his cases It supplies the essentials of modern therapeutic knowledge in concise form. The various diseases and symptoms are alphabetically arranged for quick reference. The prescriptions conform to the standards of the U.S. P. X. and the National Formulary. There are also numerous tables, a list of incompatib lities, urinalysis, etc.

Practical Nursing For Male Nurses in the R. A. M. C. and Other Forces. By Colonel E. M. Hassard, A.M.S., and A. R. Hassard. 2nd Edition. 12mo of 407 pages. New York, William Wood and Company, 1927. Cloth, \$3.50

The author has divided the art of Nursing into three divisions that is Medical, Surgical and Mental branch is treated as a separate entity, valuable suggestions in each being outlined. To the nurse in training this work is excellent not only for the practical side of her work but also the theoretical has been simplified in pointing out the more obvious symptoms of the common diseases and the importance of their recognition side routine is carefully stated. While the book was intended for the Orderlies in Army Service, the military details make it the more valuable for civil practice. A good book not only for the nurse but also for the practitioner to carefully read.

COLLECTED PAPERS OF THE MAYO CLINIC AND THE MAYO FOUNDATION Volume XVIII, 1926 Octavo of 1329 pages, with 386 illustrations Philadelphia and Lon-FOUNDATION Volume XVIII, 1926 pages, with 386 illustrations Philadel don, W B Saunders Company, 1927 Cloth, \$13 00

This, the 13th volume of "Collected Papers of the Mayo Clinic and the Mayo Foundation" has 1329 pages The print is clear The subject mat-It is well bound ter is systematically and concisely presented, and is pro-fusely illustrated. There are approximately 194 separate articles, covering almost every conceivable subject of current interest in medicine, surgery and research. One hundred and eighty-nine contributors have made this work possible.

A review of the contents of a book of this sort would necessitate a resumé of the 194 papers contained therein. Such a resumé is not possible in a brief review of this kmd

It is pertinent to note that the articles relative to the alimentary tract occupy by far the greatest amount of space. Some of the other subjects upon which six to twenty individual papers appear are 1 The urogenital organs, 2 The ductless glands, 3 The blood and circulatory organs, 4 The skin and syphilis, 5 The head, trunk and extremities, 6 The brain, spinal cord and nerves, 7 Technic

For the medical student, the case reports, as well as much of the subject matter, will serve as excellent supplementary reading to his study of surgery For the clinician, the surgeon, and the specialist there is a message well worth having in each article pertaining to his special branch of medicine. As an up-to-date work of reference this volume is incomparable.

MERRILL N FOOTE.

MENTAL HANDICAPS IN GOLF By THEO B HYSLOP, M D With forewords by Rolf Creasy and John Henry Taylor 16mo of 111 pages Baltimore, The Williams and Wilkins Company, 1927 Cloth, \$150

The average golfer today, in quest of a way to improve his game, thinks only in terms of swings and stance. But this little book brings to our attention the effects of psychology on our game. The author offers a very clever formula for raising our game to par Practice, Automatism, Reason

The book will improve anybody's game, but it is especially helpful to the tournament player

KENNETH MACINNES

THE THOMAS SPLINT AND ITS MODIFICATIONS IN THE TREATMENT OF FRACTURES By MEURICE SINCLAIR, C.M.G., M.B., Ch.B. Octavo of 168 pages, illustrated. London and New York, Oxford University Press, 1927 Cloth, \$450 (Oxford Medical Publications)

Out of a rich experience in War, Major Sinclair has developed a treatment by means of the Thomas Splint for various types of fractures in the upper and lower extremities as well as the handling of the adjacent tis-

sues in the area of the fractured bones. A careful study of what appears at first reading as complex, becomes clear, reasonable and easy of application on second consideration. Emphasis is placed on restoration of func-tion and the best methods for obtaining the same. The importance of careful and accurate first aid treatment is stressed in order that subsequent treatment may be lessened and the local areas saved as much trauma as possible. Closing chapters on Radiography and dimensions for upper and lower extremity splints as well as the preparation of the glue or gelatine adhesives will aid the attending surgeon or physician in preparation for the treatment of these fractures. A very valuable contribution to the Treatment of Fractures

THE MEDICAL CLINICS OF NORTH AMERICA of March 1927 (Boston Number) Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$12.00 net

The fifth number published in March, 1927, is the Boston Number, and the same statement regarding special mention of individual articles applies as in the case of the New York number. There are twenty-three articles in this volume of clinical lectures from the various Bos-ton hospitals Naturally, it is impossible to mention each article of such a long series individually, so that a few will be mentioned here and there to show the general tone of the book and the character of the work contained therein, for instance an article which seems worthy of mention is one on The Effects of Tonsillectomy on the Acute Attack and Recurrence of Rheumatic Fever, by William H Robey and Louis M Freedman, of the Boston City Hospital, another on Diabetic Coma and Its Treatment, by Drs Elliot P Joslin, Howard F Root and Priscilla White of the New England Deaconess Hosrisk Others that might be mentioned also are The Report of a Clinic on the Prognosis of Chronic Nephritis, by Dr Henry Jackson, Jr, of the Boston City Hospital, and The Healing of Gastric Ulcer, by Dr Franklin W White of the same institution

In both numbers, the articles are so numerous and on such widely diverse subjects, that together they consti-tute almost a condensed text book on clinical medicine.

WM HENRY DONNELLY

MEDICAL CLINICS OF NORTH AMERICA. Vol. 10, No 6 May 1927 (Heart Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.

This number of the Medical Clinics of North America presents the lectures given at the Seminar on Diseases of the Heart under the auspices of the Philadelphia Medical Society during the fall and winter of 1926-1927, and is devoted entirely to cardiac conditions with the exception of three lectures, one on general par-alysis of the insane, one on sickle cell anemia, and one on This number is an excellent one and stresses the important factors in the diagnosis and treatment of heart conditions The mechanical instruments of precision are explained as clearly and as simply as possible and the value of each instrument is clearly indicated Such subjects are presented as How to Tell the Cardiac Arhythmias at the Bedside, Acute Endocarditis, Diagnosis of Heart Failure, acute and chronic Pericarditis, Diagnosis of Aortic Aneurysm, Angina Pectoris The Circulation in Relation to Surgery. The two main objects of these lectures as described by Dr Riesman in the introduction of the volume are

1 To restate in terms of practical experience the facts concerning the circulation that every medical surgeon and specialist-should man-physician, know

2 To lay before you the most recent discoveries in physiology, anatomy and technic.

These objects have been accomplished in this excellent volume of the Medical Clinics HENRY M MOSES

STERILIZATION OF THE MENTALLY UNFIT

The subject of the legal sterilization of the unfit is discussed in the December 1927 issue of Northwest Medicine in an article by Dr R. E. L. Steiner, of Salem, Oregon, in an article entitled "Eugenics in Oregon". After quoting the recent decision of the United States Supreme Court upholding the constitutionality of a similar law in Virginia, the article says

"This decision is a positive index as to the serious thought and wishes of our best minds Oregon has been well to the front in this movement. Oregon's Board of Eugenics is composed of the members of the State Board of Health, the Superintendents of the State Mental Hospitals, the Feeble Minded School, and the State Penitentiary Each case reported is given careful legal protection to the person involved, with all possible court review The members of the Board pay their own personal expenses in this work Dr J N Smith, Superintendent of the State Institution for Feebleminded, is the fearless and outstanding man in the Oregon work, and everyone should appreciate his work and worth in this movement The following resume will show the activities of the Board of Eugenics

OREGON STATE HOSPITAL

Male—Castrations Female—Sterilizations	20 41
Since the Act was passed 1918 Male—Castrations	57
Vasectomies Female—Sterilizations	79
Ovariotomies Institution for Feebleminded	22
Male and Female sterilizations and castrations Eastern Oregon State Hospital	280
Male and Female sterilizations and castrations	70
Total	574

"The California institutions, according to Dr F O Butler, have sterilized and unsexed more than 4,600 Our adjoining State of Washington has not been active in this line of work Idaho, at her last session of the legislature, passed a sterilization act similar to the Oregon law

"The financial side of this matter should not be overlooked. In a recent article by Secretary Herbert Hoover, statistics were shown that in the United States the institutional population of the insane was 225,685, with a total expenditure for maintenance of \$63,673,-15900, or a general average per capita cost for the year of \$28213. SEALED AMBER BOTTLES

Protect the Vitamin Potency of

PATCH'S FLAVORED COD LIVER OIL

It is now generally agreed that cod liver oil is the richest known source of vitamin A and anti rachitic vitamin. In the administration of cod liver oil, however, much depends upon the vitamin potency of the oil which is prescribed.

the vitamin potency of the oil which is prescribed.

Patch's Flavored Cod Liver Oil is recognized by the profession as a dependable highly potent product which gives definite results. This product is made in the Patch Company plants along the North Atlantic Coast from strictly fresh livers. In addition to the land plants the Patch Company operates cookers on trawlers which sail out of the New England ports. On these trawlers the oil is made within a very short time after the fish are hauled in over the side of the boat A sample of every lot of oil produced is biologically assayed. The vitamin potency is guaranteed. In order to preserve the high vitamin potency Patch's Flavored Cod Liver Oil is bottled at once in amber glass bottles to keep out the light. It is also promptly sealed to keep out the air. These precautions are taken because light and air destroy vitamin potency. Thus Patch's Flavored Cod Liver Oil reaches the patient in its original potent condition.

Children really enjoy Patch's Flavored Cod Liver Oil

Children really enjoy Patch's Flavored Cod Laver Oil because it tastes good. If you can give a small dose of highly potent and pleasantly flavored cod liver oil the problem of administration is solved.

CHESTER FORD DURYEA, M.D. DIRECTOR

(Continued from page 166)

"In the books of these two men we see their essential differences 'Vesalius' in classical Latin, superb in its illustrations and form, is a treatise to marvel at 'Paré', a readable, rambling collection in the homely, forcible French of the day, is a book to be enjoyed. Here, too, is a contribution of Paré, not to medicine alone, for he should be grouped with Rabelais and Palissy as one who crystallized French prose and liberated it from the yoke of Latinity. No wonder that Ronsard should have graced his works with a sonnet, for here was another fellow artisan at the edifice of a national language which the 'Pleiade' was building

"Contrasting with the formal well-planned text of the trained professor of anatomy we have the well-intentioned but somewhat disorganized recordings of a man who has gained his experiences slowly and with difficulty and whose childlike amazement before the wonders of nature in the end runs riot. So we see at the head of the list of chapters the very proper introduction to anatomy, followed by wounds, bandages, and operations. Then there succeeds such a "hodge podge" as gout, syphilis, pest, smallpox, poisons, the physiology of generation, culminating in the 'Monsters' where are depicted the 'thanacth' which we have illustrated and the 'hait, which lives on air alone'. Can we imagine Vesalius concerned with such old-wives tales!

"The illustrations of the two books also differ in selection and treatment. Those of Vesalius with their classical beauty of the Italian Renaissance have never been equaled in the history of medical illustration. In Pare we find simple wood cuts, the majority showing surgical instruments and matters of technique of this practical man or the naïve representation of strange animals and mythical monsters which had excited his wonder.

"As to style, we must leave that of Vesalius to the appreciation of the Latin scholar, but can hazard a guess that it is as formal and correct as was the man Paré we can enjoy—homely, forceful phrases, savory of the talk of the common people of his day It is easy to feel an intimacy with this kindly humored man who tells how he stopped one day to laugh with a crowd of children at the antics of a monkey who, he says, 'monstroit son cul qui estoit tousiours a decouvert, á cause que son habit estoit court, de peur quil ne fust saffrane' Here surely is the touch, not of pity, but of vulgarity, which also makes the whole world kin

"So if you wish to know this man, get his 'Apologies and Travels'—his story of his daily life in those troubled times will hold you like a novel"

(Continued from page 170-adv xviii)

wound and the vas divided just below this ligature. The lower stump of the vas is then cut off without ligation, about one-half inch of it being removed, the skin is then closed by two catgut sutures.

"For the female a general anesthetic is used The abdomen is opened by a short incision in the median line immediately above the pubic The tube and cornu of the uterus are brought into the wound and held there by an assistant, the tube being grasped at the isthmus by a forcep The tube is severed within the cornu of the uterus by a small V-shaped incision and buried in this position facilitated, if a suture is passed on each side and parallel to the tube where it enters the uterus and just far enough apart to allow for the V-shaped incision Then the incision is made and the sutures tied, immediately closing the incision, controlling the bleeding and burying the proximal stump of the tube in the cornu The operation is finished by stitching the distal end of the tube with its overlying peritoneum to the cornu in its original posi-The other side is then treated in the same manner and the abdominal wound closed The operation is simple and convalescence is prompt

"I hope that the time will soon be here when our courts will carry an order for these operations along with their prison sentences for certain definite crimes. What right has society to expect reform from a three-time loser? He is hopelessly and helplessly defective, only to go out at the end of his sentence to repeat and repeat his crimes."

INFLUENZA PREVENTION

Epidemiologists often excuse their failure to prevent the spread of influenza by saying that they do not know its cause. However, the virus of the disease is conceded to be in infected human beings, and that an efficient prevention is the avoidance of contact with persons in the incipiency of the disease. This means quarantine against all who show signs of colds. There is abundant evidence that companies of soldiers observing quarantine in army camps escaped influenza. The December 17 issue of the Journal of the American Medical Association contains a letter from Dr. H. K. Marshall of New York, regarding the preventive effects of quarantine in 1918 in the South Sea Islands.

"I have read with interest the instructive articles on influenza based on the epidemic of 1918, which have appeared in recent issues of *The Journal*

"During this epidemic I was a member of the (Continued on page 172-adv xx)

\$636,731,590 00 of the taxpayers' money will

be expended

"This can be greatly reduced, and here is a definite and a certain method which will give society certain and immediate relief. Many could be released on parole if sterilized, and relieve the states of the burden of their care by making themselves self-supporting, or at least partly so. I will cite a few cases in the Oregon State Hospital which are similar to many others.

"Mrs M A, three of her boys and two of her daughters were inmates of the Oregon State Hospital, and many are scattered

throughout the country"

"Annie H D was admitted to the Oregon State Hospital in March, 1926, the mother of fourteen children Two died in infancy, twelve are in institutions for the feebleminded Patient again in advanced pregnancy Education very limited, can only read and write. Married first at the age of 18, had ten children by this husband Husband became insane and was committed in Idaho Two years later, apparently without divorce, patient married second husband and had four children This husband (1925) was arrested for bootlegging and convicted, later sent to a hospital on account of illness, and from there committed to this institution where he died after a few days"

"Clara D T, admitted October 12, 1926 The mother of fourteen children, twelve living, two died in infancy Patient's mother was insane for two years at the age of 45 Unfortunately this woman was again released for the Christmas week with the promise that she would be returned to the hospital They took French leave which prevented us from carrying out sterilization. She had several more years of potential child-bearing, and we have no doubt that by this time she has produced another degenerate for the State to care for She was rabid in her idea of being refused the privilege of bringing more children into the world Her husband served time in three penitentiaries and regularly had sexual relations with his daughters"

"The operation for sterilization in the male is a very simple one, very easily done under local anesthesia. The vas is located by palpation and brought next the skin of the upper portion of the scrotum. It is fixed in this position by two needles passed directly under it about half an inch apart. An incision is then made through the skin along the vas, which is thus exposed and freed from surrounding tissue. A ligature of chromic catgut is then placed upon the vas at the upper angle of the

FEE SPLITTING

The Medical Journal and Record of December 31st has a symposium on fee splitting in which it prints a letter from Dr J. F Baldwin of Columbus, Ohio, outlining conditions in Ohio regarding fee splitting The Doctor says.

"Fee splitting is almost universal in Ohio Cincinnati claims to be less contaminated but, as my information from that city is about four years old, I might perhaps get a different report Nearly all the doctors in Columbus are fee splitters, either actively or passively I have been repeatedly offered fifty per cent if I would refer patients to certain fee splitters. I regard every fee splitter as inherently dishonest, and would certainly not refer a patient to one if I could avoid it I have lost literally thousands of operative cases because of my insistent refusal to split fees I see but one remedy to protect the public from the evils of fee splitting The commercial attitude of the profession is such that I do not believe there is any hope of reform from within In Ohio we had a law passed a number of years ago, at the insistence of a member of the legislature who was a physician, forbidding fee splitting, with suitable penalty, but unfortunately the enforcement of it was placed in the hands of our State Board of Medical Administration and Registration, and there has never been any attempt at its enforcement. The members of the Board in general are known to be very "chummy" with fee splitters The only solution that I can see is by the establishment of State Medicine We all know there are arguments against State Medicine, but in view of fee splitting and all that that implies, and so far as the public itself is concerned, I see but the one thing that can be looked to for protection"

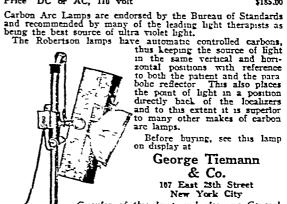

Dr Baldwin quoted a prominent educator who "called attention to the fight that was waged many years ago against the mauguration of our public school system, and he concluded with the expression of the hope that he would live long enough to see the poorest child in the community provided with as good professional services in sickness as that child could now get in securing an education His comparison was to me a novel one but unanswerable, and the essayist was evidently taken by complete surprise at the comparison and was not able to frame any sort of a comeback As the months have gone by since that discussion, I have still been unable to find any flaw in the president's comparsion of medical services and educational facilities"

"In this vicinity our fee splitters are not content with simply dividing the fee with all who send cases, but drum up business by calling on new comers and arranging in a businesslike manner for their 'trade' The standard here seems

British medical service of the colony of Fiji Some instances of the effectiveness of isolation against infection of communities with influenza came under my notice at that time which I think might be of interest, as they confirm the conclusion that 'it is quite safe to assert that perfect isolation of an individual or group during an influenza epidemic constitutes a complete protection against the disease'

"An instance of the effectiveness of isolation by means of quarantine measures occurred in American Samoa, which was under the command of an American naval officer. The port of entry here is Pago Pago. Efficient quarantine prevented infection of the inhabitants of American Samoa with influenza. Pago Pago is approximately 60 miles distant from Apia, which is the port of that part of the Samoan group administered by the government of New Zealand. Thus, while British Samoa was ravaged with influenza, American Samoa did not suffer from the disease.

"The little island of Rotumah is located about 200 miles north of the main Fiji group. This island escaped infection during the epidemic for the reason that it was entirely cut off from communication with the outside world. Ordinarily, a schedule of monthly communication between Suva, Fiji and Rotumah is maintained. During the occurrence of influenza in Suva, this schedule was interrupted and no boat was dispatched to Rotumah for a period of three months. It was then found that this island had escaped the infection.

"A resourceful planter who lived and owned a large plantation at a place called Tavium on Vanua Levu, Fiji, kept his district free of infection by means of an efficient quarantine. Although districts around him here were infected heavily, the area which he isolated remained free from infection until long after the peak of the incidence of infection of the epidemic had been reached. The cases that occurred subsequently were of only mild character.

"The Makogai Leper Asylum of Fiji also escaped the ravages of the epidemic I can speak of the facts concerning this instance from personal knowledge, as at that time I was the acting medical superintendent of the asylum asylum is located on a small island separated from Levuka, the nearest port, by 18 miles At that time it had a population of about 400 persons 350 patients with leprosy and fifty person-Until August, 1919, no cases of influenza By virtue of the quarantine restrictions which the government has in force regarding the island of Makogai at all times, an efficient quarantine against influenza was carried out easily It was necessary to make trips to Levuka in order to obtain supplies, but it was possible during these trips to avoid close contacts Levuka suffered heavily from the infection'

(Continued from page 174-adv rru)

The publication of this article had one very interesting result. It attracted the attention of Dr C H Davidson, who had had, in a certain section of Rockbridge County, a series of cases of fever which had never been satisfactorily diagnosed After reading this article he obtained blood specimens from several of these Even though the cases were several patients years old the agglutinins were found to be still present in the blood thus giving a posi-Two of these tive diagnosis for Tularaemia cases occurred in 1920 and are probably the first definitely known cases in the eastern part of the United States

"Up to the present time we have had in the State of Virginia definite knowledge of only twelve cases of this disease. There have probably been many more cases, nevertheless, I believe there have not been enough cases to justify the fear that has arisen. The twelve cases of which we have definite knowledge are as follows.

"One from Chesterfield County (1924), by Dr T S Shelton, Richmond

"Three from Rockbridge (two in 1920 and one in 1925), by Dr C H Davidson, Lexington

"Four from Lee County (1925), U S Public Service Report, February 26, 1926 "One from Surry County (1925), by Drs Douglas Vanderhoof and T D Davis, Richmond

"One from City of Richmond (1926), by Dr C I Sease

"One from Essex County (1926), by Dr F B Wilson, Tappahannock

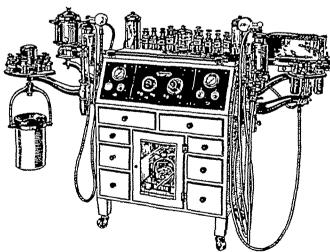

"One from Pittsylvania (1927), by Dr J C Anderson, Chatham

"As noted above there has been only one case so far in 1927 The actual situation does not apparently justify the fear that has arisen concerning the eating and handling of rabbits Rabbits that appear sick and those brought in by dogs and cats should be avoided. It would likewise be advisable for any person handling large numbers of rabbits to use rubber gloves habitually. Tularaemia is nearly always contracted by material from a rabbit getting into an open cut or sore on the hand. There is, of course, no danger from the eating of the cooked rabbit.

"It is urged that physicians send in specimens of whole blood from all suspected cases, so that if this disease is prevalent in any part of the State steps can be taken to control it

SALIPYRIN "Riedel"

is a chemical combination of antipyrin and salicylic acid. The thera peutic effects of both these components are preserved, although modified by close chemical union and in a very great degree deprived of the dangers of mechanical mixtures.

Salipyrin is distinguished from other salicylates by the comparative

freedom from ill-effects (absence of free antipyrin) and prompt antipyretic and sedative action

INDICATIONS Influenza, Colda, Catarrh of the None and Throat, Rheumatism, Neuralgia, Alcoholic Excess, Pleur isy, Dysmenorrhea, Metrorrhagia, Vaginitis, etc. If given early in the attack, Salipyrin generally succeeds in aborting colds.

Salipyrin is supplied in powder form and as SALIPYRETS in tablets of 71/2 each

Approved by the Council on Phar and Chem of the American Medical Association for inclusion with N R.

RIEDEL & CO., Inc.

to be fifty-fifty, but I am told of new aspirants for fame offering as high as ninety per cent"

"As we have no provision in this state, and I do not know of any such provision in any other state, by which only competent specialists can announce themselves as specialists and function accordingly, I think we may easily imagine the condition of affairs when the most incompetent and least experienced offer the largest commission to the attending physicians in cases needing surgery or other special attention. If the conscience of the ordinary doctor lets him sell a patient now for fifty per cent, he will not wait long when some other 'surgeon' offers him seventyfive per cent or even ninety per cent The whole proposition is utterly shameful, but I see no signs of any improvement within the profession itself Here in Columbus men who hold themselves as highest in the profession do not hesitate to de mand their pound of flesh and, as most of these men are connected with our Medical School, or occupy positions on the staffs of our hospitals, you can imagine what the effect is on the morale Here at Grant Hosof students and interns pital, where I have been doing my work for more than a quarter of a century, I do not know of a single intern who has gone out who does not, if within reach, send his work back to the fee splitting members of the staff"

TULARAEMIA IN VIRGINIA

Tularaemia has not yet made its appearance in New York State, so far as known, but this Journal of August 15, 1927, carried an article on the subject abstracted from the July, 1927, issue of the Kentucky Medical Journal The probability is that the disease will appear among rabbits in New York State and that persons will become infected New York physicians will therefore be interested in the following article from the December, 1927, Virginia Medical Monthly describing the disease in human beings in Virginia

"A recent article, on the subject of Tularaemia, in one of the popular weekly Journals having a large circulation has led to a wide spread interest in this disease throughout the state. The interest caused by this article and the desire for facts concerning the disease as evidenced by numerous inquiries causes me to believe that a brief statement as to the actual situation might be of interest.

"In the February issue this year of the Medical Monthly a brief article was published describing the symptoms of Tularaemia and other pertinent facts regarding this disease. These facts will not be repeated but a reprint will be gladly forwarded to anyone interested

OHIO CHIROPRACTIC LAW DEFEATED

The October issue of the Ohio State Medical Journal contained an article on a proposed referendum on the enactment of a law legalizing chiropractice This article was quoted in this Journal of October 15, page 1162 The December issue of the Ohio Journal contains the following article on the overwhelming defeat of the law

"The medical profession and medical organization again may be proud of still another achievement—distinct service to the public generally and a credit to scientific medicine. The decisive defeat of the initiated chiropractic bill at the general election on November 8, indicated that public opinion and public sentiment when thoroughly informed, usually arrive at the proper result.

"The vote at the election should be a source of genuine gratification to each member of medical organization, and should demonstrate conclusively the proper influence and leadership of the profession in public affairs involving questions on which the profession is especially qualified to speak

"As pointed out on this page in last month's Journal, the Policy Committee, under the direction of the Council of the State Association, has felt all along that the profession was in duty bound to participate in a campaign of public information against the pernicious and destructive proposal, in spite of the fact that many people were only too willing to misconstrue the unselfish motives which ac-This is tuated the profession still another example where the medical profession has furnished the leadership in movements for the public good, consistent with the traditions of the profession in determining the policies and activities of medical organization on the basis of public benefit

"Likewise, the result of the campaign is a definite demonstration of harmony, coopera-

tion and effectiveness, and the sincere appreciation and condemnation of the Council, the Policy Committee and the officers of the State Association is hereby expressed to the component societies, their officers and membership

"Effective organization work in opposition to the chiropractic bill was performed by various allied groups as well as by various other high-minded organizations whose leaders recognized the seriousness of the public health menace involved in the initiated bill. Likewise, most of the local health commissioners and health departments, consistent with their duties to serve and safeguard the public, were active in this campaign.

"With the result now recorded and the value of the activities proved, there is quite a general sentiment to the effect that on similar public questions in the future those official and voluntary agencies, established, promoted and maintained for public health purposes, should carry on and conduct proper educational programs, and that the chief burden in such matters should be assumed by them rather than by the medical profession itself"

MALTA FEVER IN IOWA

Malta Fever is becoming well known in many sections of the United States, including New York State The December 1927 issue of the Journal of the Iowa State Medical Society contains the following article on the disease in Iowa

"Malta fever is not uncommon in Iowa This conclusion is forced by our experience in the laboratory in the past four months Nineteen bloods, most of which were sent for Widals, gave an agglutination of the organism which causes Malta fever Twelve of these, on a repeated examination were found to agglutinate in a titre of 1 160,

(Continued on page 179-adv xxvii)

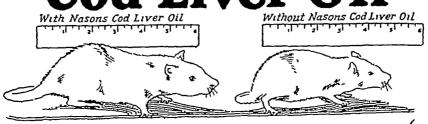

will prove unusually effective

There is a further advantage in that the special flavor of Nason's Cod Liver Oil, renders it altogether pleasing to take.

We will gladly send on request a sample bottle and further convincing evidence of quality and palatability

TAILBY-NASON COMPANY - Boston Mass Pharmacentical Manufacturers to the Professions of Medicine and Pharmacy since 1905

which is diagnostic of the disease. Three others, on one examination gave good agglutingtion. The number of positives to and varied directly with the number of bloods examined. We feel, however, that there are many cases of Main fever which are not diagnosed.

"An investigation of this disease in the state is now being undertaken. This is made possible by the co-operation of the U.S. Proble Health Service. Only through your interest and assistance will this investigation be successful. We may work together in the following ways:

"1. All bloods received at this laboratory for Widals will be examined for Malta fever. You are invited and urged to send wet or dry specimens from all cases with fever of a week or more duration. We are asking the co-operation of the branch laboratories and it is expected that specimens examined by them for typhoid will be forwarded to us for Malta fever The importance of the agglutination test is well expressed by Craig when he writes, 'There are no pathognomonic symptoms of Malta fever The The symptoms observed are so inconstant and confusing that no one of them can be said to be typical of the disease. A differential diagnosis is almost impossible in the majority of the cases without the aid of the microscope and the serum test.'

"2 An investigation of all or most of the cases confirmed by a positive agglutination test will be made by the state epidemiologist. The object will be to determine, if possible, the source and mode of transmission, and it is hoped that complete clinical records will be obtained

"Malta fever in Iowa is caused by the organism of infectious abortion in cattle or hogs. This disease in animals is present in every county and probably every township. Your patients are exposed. That a typical fever may be Malta fever. Let us help you

LARIOBEN

The New Antiseptic

LAR-IO-BEN is a 2% aromatized solution of gallate of iodbenzol with the formula

C6 H5 1-O-C-C6 H2 (OH) 2 1

LAR-IO-BEN is an ambercolored liquid, with a pleasant sweetish taste, and readily miscible with water

Its iodine content is organically combined, none being present in a free state.

LAR-IO-BEN is a powerful bactericide, and is especially valuable in nasal, pharyngeal, and laryngeal conditions where a benign antiseptic is indicated

TRAVELING MEDICAL LI-BRARY IN IOWA

The December 1921 issue of the Journal of the Journal of the John Shift Mailler! So feel, has the following editorial remarks concerning the traveling medical library of the State Library.

The new Medical Department of our Iowa State Library has evidently solved the problem which has long confronted every state library in the country that has a medical department—that of making its books and periodicals serviceable to every member, and prospective member of the medical profession in the state. The plan is so simple the wonder is that it remained for State Librarian Brigham to discover and apply it!

"The Iowa idea is simply to apply to the medical department the traveling library system which has been in successful operation in the Iowa Library Commission since 1900

"Instead of being compelled either to buy expensive books and periodicals, or go to Des Moines to consult authorities, the physician, or surgeon, or student, has only to write in for material on any subject, or for a digest of recent books and papers on any subject, and the next mail will carry the information he seeks, if it is obtainable, and the only expense attending the loan is the postage both ways

"The loans, made by the department in 1922 were 1,656—a large increase over those of the previous year. In 1923 they increased to 3,176. In 1924, to 6,308. In 1925, to 7,041. In 1926, to 11,174.

"The Journal has every reason to be proud of the record thus far made by the State's Medical Library and to anticipate the department's steadily increasing usefulness to the members of the medical profession"

NEW ABBOTT PRODUCT

The Research Department of the Abbott Laboratories announce a new pliarmaceutical product to be presented immediately to the medical profession It is Elixir of Ephedrine. This is a pleasantly flavored, palatable fluid preparation containing 1/8 of a grain of Ephedrine to the fluid dram, thus permitting the oral administration of finely divided doses of the drug to children as well as adults in Asthma and Hay Fever One teaspoonful of Elixir of Ephedrine, Abbott, contains 1/8 of a grain of Ephedrine Hydrochloride, one tablespoonful, ½ grain Required dosages can easily be adjusted Elixir of Ephedrine, Abbott, is supplied in 4-oz. and 16-oz. bottles -Adv

IN NINE CASES OUT OF TEN

The old idea that a cathartic is a cathartic and that in most cases "any old thing will do" has fortunately been exploded, and we select our laxatives today with due regard for individual idiosyncrasies, and the general condition of the case.

In nine cases out of ten though, it is safe to prescribe Agarol without further thought For Agarol combines the advgantages of lubrication, with the definite action of phenolphthalein in in-

ducing peristalsis As a rule one or half a tablespoonful, taken on retiring, will secure complete evacuation the next morning, without the griping which frequently accompanies the harsher cathartics, or the unpleasant "leakage" of mineral oil alone.

In very bad cases of fecal retention, it may be well to slightly increase the dose, or to repeat the dose two or three days in succession. In stubborn chronic cases, the dose may, on the contrary, be gradually reduced, since Agarol tends to restore natural bowel activity which is best encouraged by a gradual decrease in dosage.

Physicians interested in testing this efficient product can obtain samples and literature on Agarol by addressing Wilham R. Warner and Company, Inc., 113 West 18th Street, New York City— Adv

LIVER EXTRACT FOR ANEMIA

The value of liver for anemia having been established, the question of how to get as much as possible of the liver element into the diet has become a problem for the physician.

As the effect of the liver extract is that of a motivating force, its presentation even in small quantities frequently gives good results

The incorporation of the blood regenerating fractions of liver extract into a tonic is now attracting the interest of the medical profession.

PHOS HEPATIC EXTRACT, a tonic stimulant containing beef liver extract in a palatable form, has been prepared for cases in which a general tonic and stimulant is indicated, furnishing as it does the stimulating influence of a high vitamin content, together with the red blood regenerative factors of the liver elements

THE NON-OPERATIVE TREATMENT OF CHRONIC GLAUCOMA* By SEARLE B MARLOW, MD, SYRACUSE, N Y

SINCE Posey's paper in 1914 on "The Treatment of Chronic Simple Glaucoma with Miotics" very little has appeared in the literature about the non-surgical treatment of chronic glaucoma until 1923 when Hamburger reported his experiences first with adrenalin and later with glaucosan. The increasing interest in this method of treatment is evidenced by the fact that in the "Ophthalmic Year Book for 1923" no paper dealing with medicinal therapy is listed whereas in the volume for 1926, 15 papers are recorded. The surgical treatment, on the other hand, has received and is constantly obtaining much attention. New operations are being proposed, old ones revived Probably no one operation will ever meet the requirements of all surgeons.

The great preponderance of opinion as expressed in the majority of text books and in the discussions of papers relative to the treatment of glaucoma is that some operative procedure will' sooner or later become necessary carlier in the course of the disease operation is done the greater the likelihood that the results will be beneficial and lasting. At the present time our knowledge of glaucoma and the various operations proposed for its cure does not permit us to say with certainty that operation Moreover, operative will cure the disease treatment can never be made entirely free from risk. The possibility of infection, both early and late, will always be present to a certain de-Loss of vision not infrequently results from a marked increase in astigmatism, hemorrhage and the rapid encroachment of a scotoma over the fixation point Weeks believes that this will occur whatever the operation and perhaps in spite of any treatment. These facts are too well known to need extended dis-

They serve, however, to emphasize the uncertainty of operative treatment. The proposal of new operations and the reviving of old indicate further not only the dissatisfaction

*Read at the Annual Meeting of the Medical Society of the State of New York, at Niagara Falls N Y., May 11 1927

with the available operations but also the failure of medicinal therapy. If non-operative treatment can be shown to be at least as effective as operative its advantages immediately become apparent A large majority of ophthalmologists have probably observed one or more cases of chronic glaucoma controlled for a long time by medicinal treatment. These are selected cases and as a rule comprise solely those observed outside hospitals and clinics Zentmayer suggests that miotics may be tried in patients where the tension does not range over thirty and in patients over sixty years of Calhoun advocates miotics in three groups of cases of simple glaucoma, (1) patients over 60 years whose life expectancy is not more than 10 years, (2) patients blind in one eye, (3) in those who have lost one eye as the result of operation

The importance of thoroughly investigating the patient has long been recognized as essential not only for the purpose of diagnosis but also for treatment. In the discussion of a paper by Rowan in 1920 one speaker suggests that whether glaucoma is treated with drops or operation only a symptom is being treated and that if ever a cure is discovered it will be discovered by an internist Imre's cases treated with glandular extracts and the cases of La Grange and others associated with endocrine disorders lend strong support to this contention and indicate new possibilities They serve also to emphasize the perhaps too frequently lost-sight of fact that it is the patient who needs thorough investigation rather than the In this connection the following case may be of interest

Mrs J H N, age 40, was referred by Dr Edward Dennis, of Erie, to whom she had gone because of headache and slight blurring of vision. In the course of his examination he discovered the tension to be elevated, R 35, L 58, Gradle Schiotz. Pilocarpin had controlled the tension so that when she was first seen two months later it was R 18(5/55), L 29(2/55) Schiotz. At this time vision of each eye was

THE DEAN

302 EAST TWENTIETH STREET

NEW YORK CITY

This table shows that in nearly two-thirds the age at onset was 50 or more. It was under 50 in 5 cases of the chronic inflammatory type, over 50 in 6, of the simple case 8 were under 50, 16 over 50 This suggests a more even distribution for the chronic inflammatory cases and a great preponderance of the simple at a Ten patients were blind in one greater age eye when first seen Six of these were under 50 at the age of onset, 4 over Two of three chronic inflammatory, four of seven simple cases which were blind in one eye were under 50 at the onset of the disease Seven cases came to operation, three were under 50 at the age of These facts seem to indicate that no matter what the type of the disease the younger the patient the more devastating its effects Although the teaching that conservative treatment should be used only in cases over 60 receives some support, its use in much younger patients appears beneficial for long periods of time in both types

Table No 2 summarizes 11 cases of chronic Analysis of these inflammatory glaucoma cases results in the following Four were in an advanced stage of the disease when first seen They are the first, fourth, fifth and tenth cases in the list Case No 5 was the only one favorably influenced by miotic treatment. This patient was also the only one under fifty at the age of onset and had been observed for five years at the end of which time vision was better than at the original examination case was seen only at long intervals and very probably had not followed out the treatment One patient refused operation, consistently miotics maintaining vision for one year patient was successfully operated so far as tension was concerned but with no influence upon Thus miotic treatment was advantageous in one case only

The seven early cases had their age at onset of 35, 42, 36, 50, 52, 64 and 45 years Four subsequently came to operation One was operated elsewhere in spite of the fact that miotics had improved and maintained the vision and tension for more than one year veloped an acute attack after 6 years necessitating iridectomy with good results iridectomy failed to check the loss of vision. In the three cases not operated the vision was maintained for 15, 2 and 1 years the conclusion may be drawn that the advanced cases of chronic inflammatory glaucoma in this series progressed unfavorably in the majority of cases in spite of treatment operative or otherwise In the early cases operation benefited 2, and had no effect in one, the effect of operation in one being unknown. On the other hand three cases were favorably influenced, one for a considerable period of time. Therefore, it seems justified to state that miotics, in some cases at least, are capable of controlling the progress of the disease and that their use for a long time does not necessarily preclude good results from eventual operation. It also appears true that the younger the patient the more likely is operation to become necessary

Twenty-four cases of simple glaucoma are summarized in Table No 3 Ten were in an advanced stage of the disease when they were first seen. In one case iridectomy was done on one eye with apparent arrest of progressive change, the unoperated eye remaining under miotic treatment In two, consultants advised against operation Miotics maintained or improved vision in five cases including one in which operation was considered inadvisable Five cases failed in spite of treatment. The more rapid failure took place in the older patients so that one patient had only P L after 4 years, one 6/60 after 2 years, and one went down from 6/12 + in each eye to R 6/18, L 6-24The first two patients were 65 in one year when first seen, the last 75 The failure of the two younger patients, one 49, the other 37 at the first examination, was from 6/6 to 6/12 in 4 years and from 6/6 to 6/18 in 3 years rate of change was slow in each case, one of which was operated These cases seem to indicate that older patients with advanced disease respond less readily to miotic than young-Miotics are, however, advantageous in advanced cases, only two cases of this series becoming seriously handicapped while under observation Of fourteen early cases the vision of five at the last examination was less than at the first. One case was operated after nine years of observation This was a case of high myopia in which vision continued to fail and the field to contract in spite of the fact that miotics kept the tension at a normal level LaGrange operation was successful in bringing the tension to a normal level but failed to check the advancement of a scotoma and further loss of vision. In two the visual loss was accounted for by the development of lens changes In another advanced cardio-renal disease with retinal changes was an unfavorable underlying factor In the last the vision had fallen from 6/6 to 6/9 after 6 years due to the glaucoma although the tension was not greatly elevated In this case a consultant advised The remaining nine cases maintained the vision of the first examination so that miotics apparently checked the progress of the disease

Thus with two exceptions all the early cases did well no matter what the age at onset While operation may eventually become necessary in some of the vounger patients this is less likely to occur in older patients. The teaching that patients of 60 years or over can be safely treated with miotics gains some sup-

6/5 with her glasses Both a c were deep, pupils 2-3mm, active, shallow cupping of both discs The peripheral field of the R eye was normal, the left somewhat contracted in the lower nasal quadrant, both Blind Spots enlarged 2/1000 test but no other changes The treatment which Dr Dennis had ordered was continued Seven months later when she returned because of blurring the tension was R 18(5/55) L 16(55/55) Her glasses were modified with relief After another two months her symptoms recurred but vision remained At this time the tension of the left eye was 36 (3/75), the R unchanged Eserin, Pilocarpin and Cocaine was ordered to be used more frequently in the left eye She was asked to see an internist at this time Dr W A Groat summarized his report as follows 'My impression was that there was endocrine imbalance, and I linked the inability to nurse her children, the progressive gain in weight with each pregnancy and the type of build as showing some pituitary dysfunction with possibly compensatory hyperthyroidism" In addition he advised X-ray examination of her teeth and the wearing of a truss for an um-In the meantime the tension bilical hermia came down to normal and she was not seen again for another eleven months During the interval eleven abscessed teeth were extracted and she had worn the truss Although-no drops had been used for more than six months, she had been entirely free from symptoms, had seen no halos the significance of which she understood thoroughly, and which had been regularly present prior to each previous visit. At this last examination the vision of each eye was 6/5, tension each 18(5/55) She attributed her good condition to the extraction of the teeth and the wearing of the truss

Until Hamburger's report in 1923 eserin and pilocarpin have been the chief remedies available for the medicinal treatment of chronic glaucoma. The use of adrenalin and glaucosan appear to be effective means of control in selected cases, some writers going so far as to state that by them operation can frequently be avoided. However, insufficient time has elapsed and use by a large enough number of widely distributed observers is still lacking to permit the estimation of its real value. Moreover, the few unfavorable reports in which elevation of tension has followed its use indi-

cate that the cases must be carefully selected Where this is done its trial seems more than justified No cases treated in this way are available for this discussion

The purpose of this paper is to report the results of miotic treatment in a series of 35 cases of chronic glaucoma which have been observed in the practice of my father, Dr F W Marlow The longest period of observation was 14 years in one case, the shortest one year, two-thirds have been observed for four years or less. The following table indicates the distribution

14	"	1	"
10	"	1	a.
9	"	1	"
8654321	"	1	"
6	"	3	cases
5	"	3	"
4	"	3 3 5	"
3	"	5	**
2	"	10	"
1	year	7	"

In all but seven of these cases the miotics have been prescribed according to the formula of Wickerkiewicz which combines Eserin, Pilocarpin and Cocaine in the following proportions

T	0 02
	0 40
	0.20
	20 00
	T

This prescription has as a rule been used only twice daily. In no case have iris adhesions become apparent and cases of toxic conjunctivitis have been exceptional. The impression gained from the extensive use of this combination is that it is more efficient and less annoying to the patient than either eserin or pilocarpin alone.

In order to discuss intelligently the treatment of chronic glaucoma the two forms in which this condition occurs must first be recognized. The distinction between chronic inflammatory glaucoma and simple glaucoma is so well known that no elaboration is necessary. It does seem worth while, however, to restate Schweigger's view that chronic inflammatory glaucoma is dormant potential acute inflammatory glaucoma. It is for this reason that operation is almost universally considered to be necessary early in this type of the disease

All the cases are summarized in Table 1

				Chrome	Inflammatory	Sin	iple

TABLE 1 SUMMARY OF ELEVEY CASES OF CHROMIC INFLAMMATORY GLAUCOMA

PROGRESS AND OPPORTUNITIES

By CHARLES H GOODRICH, MD, BROOKLYN, N Y

The President : Inaugural Address before the Medical Society of the County of Kings January 17, 1928

COMETIME during the fading years of the last century when our youth and innocence were more conspicuous than now, we listened to a sermon delivered by an aged Presbyterian His small, gentle worn voice, his white hair and flowing beard and his mild conversational reading of his carefully prepared discourse on "Sin" caused us at first to pity and almost scorn his old-fashioned conservatism fore he had completed his twenty minutes of preaching he had convinced us of a new truth upon which we could properly base progressive Briefly, he stated and proved by the action Holy Writ that our sins of commission were trivial in importance with our sins of omission and he declared that a few mistakes, even if wilfull or vicious, were not to be compared with the thousands of opportunities for doing right things that were neglected or unthought Every human effort may occasionally go wrong, but the serious fault lies in not thinking out and making the number of efforts reasonably to be expected from a full life To quote almost verbatim "Our sins of commission are to our sins of omission as is an anthill to Mount Everest in the Himalayas" If this thought is carefully revolved we can see in it the key-note of the progress of which we as individuals dream. And there are no regrets more poignant than those born of neglected opportunities

A second suggestive thought in connection with progress, one that psychologists have recognized for centuries, and which the most lustrous quack of modern times appropriated as a new discovery. It the mind is fully occupied with worthy thoughts and activities, there is no room for the unworthy, that is, lost cerebration is reduced to a minimum

Granting, as we reasonably may, that these two principles can apply to organizations of men and women as well as to individuals, the logical position for us is in the center of the firing line of modern medical thought and activity testing our seventeen hundred minds and their servant functions to full capacity, that we, as a Society, may leave as little as possible undone that can be done. The record of this society is comparatively excellent but we have only "commenced to begin to make ready to start to go"

Progress and Speed—Progress is a stylish word. In the two or three past decades it has been the text of hundreds of sermons and included in the title of thousands of addresses. Many genuine workers have lived by the word, while more have consumed valuable time by gesticulating and vociferating their belief in it, and not a few have scoffed at the word and

the idea, contending that civilization has lost some ground since the so-called new or progressive era began So people fall into one of three groups, the workers for progress (or the team), the gesticulators and vociferators (the cheerio boys), and the pessimists Among the pogressive workers may be found a percentage of those whose intellectual quotient is dated back a few years, who think that speed necessarily means progress They remind us of the late Senator Sutherland's arraignment of the "Progressives" in the political struggles of pre-war days, when he said "the speed limit has been taken off—the Stop, Look and Listen signs have been removed, and the importunate cry is 'Full speed ahead—get somewhere else than where you are, it matters not where, but in God's name let it be quickly!" To any thoughtful, unexcited observer there can be no doubt as to the progress of the past quarter century, notwithstanding the rude jolts and smashes with which its march has been inter-Education, industry, banking, farming and science leading them all by the hand, have progressed But the noise of some people who say a thousand words where two would do has diverted the attention at times from the charms of progress And although progress may be described as beautiful, her graceful curves and satin complexion have been marred by a few deformities, diseases and These defects have served to confuse our appreciation of the real beauty, functional power and physiological activity of this new Goddess of Liberty and Reason We can agree that essentially true progress is a healthy being, and that whatever imperfections she develops are pathological and not histological

Three important lesions are quite evident
(a) The first is destructive criticism. This
is an inflammatory process characterized by a
low-grade infection which gathers force as it
proceeds, ultimately tending to suppuration
and necrosis, and unless competently treated
before necrosis takes place, results in permanent defects and limitation of function

- (b) Second—Eagerness for notoriety This is a hypertrophic, riotous overgrowth of originally normal blasts, benign until magnitude causes pressure and obliteration of normally functioning parts
- (c) The third and most serious lesion is the cancer that threatens the life of progress—the subtle, insinuating arguments and innuendos that would undermine all great accomplishments by pretending to believe and to half prove that they have been the results of base motives and elaborated for selfish

port from those cases They further suggest that the value of this treatment is not limited to patients of this age and that not a few cases can be carried along safely for a considerable

period if they are carefully watched

In 1901 DeSchweinitz in a paper read before the American Ophthalmological Society advocated iridectomy on the second eye at the earliest possible moment in all cases of acute and chronic inflammatory, and simple glaucoma if any signs of the disease could be demonstrated. The general trend of the discussion supported his opinion. In 1920 in the discussion of the paper of Rowan, already referred to, a less radical attitude was manifest although some further support of this opinion is offered. It is interesting in this connection to note the results of non-operative treatment in the patients in this series who were blind in one eye when first examined.

Ten such cases are listed in Table No 4

cases the progressive contraction of the field appeared slowed. In two cases which had nor mal periphery but typical scotomata the scotomata remained stationary under observation. In one case observed for nine years before operation while the tension and central vision were maintained the field progressively changed. Operation in this case while successful in reducing the tension did not check the advance of the field changes. In the advanced cases treatment seemed to have much less effect.

The intra-ocular tension was kept within normal limits in 8 chronic inflammatory cases and 16 simple cases. Three chronic inflammatory cases were operated with a good result Two others were operated without checking the progress of the disease. One of these was in an advanced stage, the other in an early stage of the disease. In four of eight cases of simple glaucoma in which the tension was not con-

TABLE 4

Two cases failed rather rapidly and one developed an acute attack In the case that failed from 6/6 to 6/12 after four years a consultant advised against operation The remains ing cases had as good or better vision at the last examination than at the first. They would seem to support Calhoun's suggestion that patients with one blind eye should be treated The fact that one eye is blind with miotics may be contributory to the good results obtained for two reasons First being blind in one eye the diagnosis is made earlier in the second Second having but one eye the patient is correspondingly concerned and takes better care of this eye

Although the treatment appears to have maintained the vision in the majority of these cases during the period of observation it has been less effective in arresting the contraction of the field of vision. In only one case was the field of vision larger at the last examination than at the first. In many of the early

trolled by miotics the vision improved in one eye. One maintained the vision of the first examination for little over a year although tension was considerably above the normal Two failed and may have been operated elsewhere. One had rather marked arterial disease. All but one were advanced cases. The one early case was the case with arterial disease. This constitutes on the whole a favorable showing for the treatment employed. It further indicates that increased tension is only a part of the disease process.

Although this series of cases is too small to allow the drawing of general conclusions, they seem to suggest that nonsurgical treatment is justified in a large number of cases. They also emphasize what is already generally accepted, that treatment, surgical or medical, is more likely to be successful when supplemented by careful and thorough investigation of the patient.

an admirably courageous and efficient Controller of the City of New York who was not trained in a bank or law office. But that there would be a generalized increase of hospital efficiency under universal medical superintendency, is proven by record.

Negro Physicians —Our negro population is increasing and with this the number of colored physicians These receive standard medical education, and a few of them acquire hospital experience as internes. But they have few opportunities to develop as skilled clini-The doors cians and we need them as such of most hospitals are closed to them however excellent their training From a distant city there came some years ago, a skilled learned young negro surgeon, bent on serving his people We met him and heard his story could work only in crowded tenements hospital could be induced to permit him a place to work Conscientiously he referred serious major cases whom he was qualified to serve White nurses refused to to regular hospitals work in the operating room if he was to observe an operation on a white woman He had vision and courage He bought a house, mortgaged heavily, and created his own hospital There he works diligently for rich and poor alike with better than average skill But few could do this If we are to strive consistently for the elevation of the standard of the practice of Medicine and Surgery in our county, we have an opportunity to serve our colored physicians by creating clinical advantages for them How can we help do it? Think it over

Medical Ethics -The ethics of our professional life should not be the sleepy acceptations of the good rules of the past. Here also are opportunities Ethical waves sweep over a people or a generation and affect more or less all classes of workers. And a period of exceptional general prosperity is the time of greatest danger Vices undreamed of in tense. lean times creep in to the disadvantage of the conscientious worker and the needy patron That selfishness is an increasing characteristic of our people is easily demonstrated. Let it In business, dishonesty losses not touch us have increased amazingly in the last two years We should be scrupulously honest not only as to our business relations with our patients and each other, but we should give our patients just as nearly one hundred per cent service as our physical and intellectual powers will per-If there is one line of service in which the Golden Rule should be the standard of measure, it is ours. It has always been easy for the doctor to be selfish, or dishonest, or both because of knowledge he possesses denied to his patient. We hear rumors of excessive charges for minor services, of fee-splitting, of deliberate prolongation of disability for profit. As a society we should lend positive energetic influence toward stopping all these, not only here, but everywhere

We have an opportunity to serve those who labor with their hands for a daily or weekly We believe in a living wage, even a cultural wage, and hours of labor that will permit of reasonable rest, recreation, conservation of health and culture We can show these good men and women who are so much richer in money and time than were their fathers and mothers how to use some of their leisure time in caring for their bodies, elevating their minds, and planning a system of economics that will safeguard their futures The family doctor is sometimes the best and most cultured friend of these homes An informing, friendly suggestion as we move among them may be potentially our greatest hygienic and cultural service to our time For "our life and conduct are ever propagating themselves by a law of social contagion throughout the circles and times in which we live

There Is Another Opportunity in Ethics-Every occupation, especially every professional one, automatically develops competi-Competition of individuals or groups often lead to petty jealousies and differences of varying magnitudes The medical profession is renowned for its petty jealousies, the extreme personal sensitiveness of some and the painstaking care of many to avoid criticism of ethical conduct, even to considering each other while the patient suffers sional life is tense Economic pressure is often a wearying factor for many years or throughout a career And many of us live in a very small world compared with other professional and business men of equal intellectual attainments With these conditions, plus the misrepresenation and plottings of people for their own fancied gain, misunderstandings, jealousies, and differences arise One of our opportunities as a society is to obliterate these by a unanimous determination for fraternalism and comradeship regardless of ancient squabbles, and to allow no professional discussion to lead to personal ennity

The Visiting Committee—We have an opportunity to serve our members when sickness or accident disables them. A Visiting Committee is ready to prove our fraternal spirit. The chairman of last year's committee tells me that no case of illness or accident in our membership has come to him directly and the office of the society corroborates him. If a disabled member, his family, or his doctor friends will report instances of illness or injury to this office our Visiting Committee will gladly enlarge its services.

Medical Economics—In the field of medical economics there are opportunities and duties

purposes The "Smart Alecks" of the literary world have led the way and find a few copyists in all lines, even in ours. This is a real danger today throughout civilization. Progress will die when we cease to believe in each other! Let us credit all good work to good motives and believe that in every man for whom such a credit is established there are more good motives ready to work

However minute these lesions in our progress here, let us practice the only rational treatment—complete, prompt excision of all three budding bumps of pathology—and consign the criticism that is only destructive, noise that is only for notoriety, and the subtle questioning of motives to the dressing-pail and the incinerator. Then all this metabolic vigor can be turned into worthy channels and our Goddess will expand and wax more powerful therefor.

Progress develops with the recognition, seizure, and employment of opportunities. We now take off for a spin over the field of opportunities in our plane "The Spirit of Kings County" and what do we see?

Scientific Programs - This is a body of scientific men and women. We should not be content with routine work, however excellently and even elegantly done We should produce scientific results of consequence and publish them with promptness and care Every member's accomplishment in evolving new methods of diagnosis and treatment is a glory and credit to the Society and its presentation here or in one of the special sections or societies meeting in this building, places Kings County on record Perhaps we have been so busy with large community problems that we have not stimulated this type of work adequately But the call is on from leaders of scientific thought among our membership, and we hope that this cardinal opportunity will be recognized, seized, and employed by many in 1928 The demand for strictly scientific programs and open discussions at some of these meetings is urgent and will be met The response will be watched with interest to ascertain how urgently they were really wanted Research Work—Research work is not pos-

Research Work—Research work is not possible for many of us but there are fields for study in which some of our members may well seek glory and the gratitude of all mankind. The causes and cure of pernicious anæmia, the prevention and cure of blood-stream infections, the prevention and cure of Parkinson's Disease, the cure of Glioma, these are some of the problems for the solution of which the world waits. Why cannot Kings County, with its incompletely used wealth of clinical material, undertake work of this type to a greater extend than heretofore?

tent than heretofore?

The Follow-Up Record -In our work the

true test is the end result of medical, surgical, or special treatment. The follow-up record is therefore essential. Are we, as a group, following-up as we should? It is done in the ward work of hospitals with varying degrees of enthusiasm and efficiency, but how about the vast amount of private work in your practices? This is a real opportunity for service, quite comparable with the work we have done in advancing the periodic examinations of apparently healthy persons

The Teaching of Treatment -A part of our scientific duty is to note the drift of extreme enthusiasms and how they crowd out the timehonored, proven practices, the partial paralysis of progress During the past twenty years, great attention has been focussed by our profession upon diagnosis-and medical college teaching has advanced amazingly the ability of the young graduate and hospital interne to make a logical, intelligent, accurate diagnosis I could tell you at length of several instances of prompt, limbsaving, life saving, emergency diagnoses made by our internes during the past year-diagnoses which would do credit to any doctor One of this same group told me a few days ago, "I know nothing about treatment-especially medical treatment-except what I have learned here"

The trouble is this—in giving to students such excellent training in diagnosis there has been a lessening of teaching of treatment—especially the detailed teaching and training in medicinal therapeutics It has been a case of not loving Cæsar less, but Rome more—forgetful of the fact that had it not been for Cæsar, Rome might have been different The student's years in medical school are limited, only so much time is available If more time is occupied in training him in diagnostics, there is so much less for treatment, and this, with broader training in surgery and new special forms of therapy-electrotherapeutics, physio-therapy and the like-has crowded materia medica, pharmacology, and medicinal therapeutics into a small, very dark corner Thus one of the tasks to which we must co-operatively bend is to induce leading medical schools to teach more materia medica, pharmacology, and medicinal therapeutics even if it means longer courses

Our hospitals are centers of scientific work They function with varying degrees of commendable efficiency. If we can suggest and influence their Trustees and committees in any way that will expand and enlarge this efficiency, it is clearly one of our opportunities. One of the elementary hospital truths of which we all are sure is that ideally every hospital superintendent should be a trained physician with a flair for executive work. Not that there are no efficient lay superintendents—we could name one on the instant, just as we can name

is not this an opportunity to serve the community, to think and plan and work to prevent this killing? The authorities are trying their best Traffic police are in earnest Civic bodies are talking, planning, placarding, pleading What can we do? We can plan to drive safely and heed, not scorn, all notices and safeguards, but anyone can do this We have never believed much in professional emblems on cars, some think you are advertising, and popular prejudice would oppose the special privilege in traffic it sometimes brings we are willing to change and adopt the standard emblem if, by so doing, we can in time make the police when they see it feel "Here comes a safety guy," and imbue with confidence rather than terrified uncertainty every blessed child (and cussed child) and every bent old man and tottering old lady when they see us coming If a fleet of 1,500 motors advertising the safety spirit and demonstrating kindly consideration in driving can be turned loose in this borough, we might by example and precept ultimately help to reduce these killings and render valuable service for

Prevention of Nervous Diseases — When Charles L Dana was with us in November he told us that although measures were studied and advertised for the prevention of all sorts of contagious and communicable diseases, occupational diseases, accidents, and poisonings, no public authorities seemed interested in studying and working out a plan for the prevention of nervous diseases. We hope that a campaign leading to the planning for the prevention of some of the common nervous diseases may be initiated in this community by our society this year. It is a real opportunity

Endowment of the Society—On the financial side we have to recall that while almost all business and scientific institutions are planning to enlarge so that they can produce more money, more profit, our aim is to enlarge our usefulness to the profession and community which costs money. Our running expenses have been paid out of the dues from members, and it is desirable to keep these dues as low as is possible for obvious reasons, chief of which is the desirability of wide participation in organized medicine, the duty and responsibility of every practitioner of character and scientific worth

Now, if we are expanding not to make money but to spend it, we must, somehow, obtain the money that we are to spend. If it is not coming from the dues it must come from gifts. The most permanent kind of gift for any society of this character is that designated for the endowment fund. It seems to us that several hundred of our membership should be able to add twenty, forty, fifty or a hundred

dollars a year to the endowment fund of the Medical Society of the County of Kings Think about it If we are going on with our expansion, if our work is to be larger and finer, we must have money This is one way to get it

The Codicil Club—Another is the so-called Codicil Club—At the Wendell Phillips dinner a little more than a year ago, eight of us in discussing our society, agreed to set aside a definite percentage of our estates in our wills for the Medical Society of the County of Kings—The specific promise was at least two thousand dollars (\$2,000 00)—The Codicil Club is thus started with eight members—We want two hundred members before the year is over. This is an opportunity—It hurts no one, it would be a wonderful thing for the society

A third practical method of increasing our endowment fund is a life membership based upon actuarial figures upon the average expectation of life. This can be so priced as to be as advantageous to the members as the average life insurance contract, and yet if the sum paid is administered as our trustees know how to do it, the annual dues of this member can be paid out of principal and interest and always leave something for the endowment fund of the society Such a plan has been under consideration by our trustees for several If there is a general demand by our membership for it, we are sure that the trustees will make it available promptly. It would be good for the individual and good for the society

As your president sees it, the rapid and continuous development of an endowment fund is the share of our members in financing our For the great building proposition which we have ahead of us we must look to the community at large, for our service to them should recommend our cause to philanthropic citizens of wealth A greater medical society and academy of medicine building would be an ornament and a resource to the community corresponding to a mature university, for our library and reading-rooms constitute the most important permanent scientific resource in the county As President Welton told you a year ago, we must double the capacity of our library stack rooms, double the size of our reading rooms, and double or triple the size of our auditorium We must provide more room for office and library workers, and more workers who must be paid salaries should provide here the offices for all of the allied public welfare committees and agencies who work with us and assist us materially in accomplishing our community work reduced rentals would ease our expense account and much lost motion would be saved for the several corps of workers More work

for our consideration. Some of your officers have long desired and hoped to establish here a credit bureau for your information and advantage. There are too many families who consistently and throughout a life time gain credit from one doctor after another and never

The practice of Medicine and Surgery by corporations is not legalized under the laws of the State of New York This is especially important for us to consider in connection with the workings of the Workmen's Compensation Act Several insurance companies who write large volumes of workmen's compensation insurance are not only giving advice and treatment through physician employees, but are urging and directing the insured to take the companies' treatment rather than that of the doctor whom he or his employer has chosen, while the Compensation Act places the responsibility for treatment upon the employer Although we know of no instance in which the insurance company has charged the patient for services, there seems to be enough financial gain in the procedure to induce the companies to employ salaried doctors and nurses, and equip fine offices and treatment rooms, and to some this savors of illegal Although we seek no quarrel with insurance companies, many of whom are clean, honorable and fair dealing even with busy and unbusiness-like doctors, if they are practicing medicine or surgery illegally, may we not have an opportunity for service to them and to the state in calling attention to the fact?

Another phase of the practice of medicine by corporations has been suggested by the welfare work and medical and surgical care given employees by many of our greatest and most beneficent organizations As far as we have learned there has been no unfavorable reaction to this practice, except fault-finding by the employees thus served freely ever, all questions concerning the practice of medicine by corporations will be recommended to our committee on medical economics for careful comprehensive review and recommen-And on the committee on medical economics we have placed, among others, two Thus the prominent industrial surgeons matter should have wise consideration and

Preventive Medicine—In the realm of preventive medicine we have the opportunity of individual and organized action in conscientiously supporting every regulation mapped out as standard by our City's Department of Health—This is merely conventional citizenship for the physician or surgeon—But above this conventional line there are opportunities and duties potentially great, such as broadcasting to timorous parents the advisability

and safety of the preventive treatment of diphtheria, the creating of popular sentiment and demand for tetanus antitoxin injections in all punctured and dirty lacerated wounds and compound fractures, and making unpopular the person who persists in bringing to theaters, concerts, lectures and church services an infectious rhinitis, pharyngitis, tonsillitis, or These things can be accomplshed bronchitis best by daily personal work by us all We can drop a wise enlightening word wherever the dropping of it can be germane to the subjects we are discussing with patients. And these are only a few of the subjects we can use Tuberculosis is always in the city and many are still ignorant of ordinary preventive measures The recurrence of youth, which is said to be the real cause of wars, makes necessary the constant efforts to diffuse the principles of Organization work venereal prophylaxis such as that done by our admirable public health committee lays a fine foundation, but personal work is the key to complete diffusion of knowledge in preventive medicine and surgery

Anti-Tuberculosis Work — The month of March has been set aside by the National Tuberculosis Association for a nationwide drive for the early diagnosis of tuberculosis are asked by the local committee to co-operate We will furnish speakers for high actively school audiences and offer at least one practical lecture on the subject, but our greatest service in this drive will be individually and collectively to stimulate the physical examination of all the people who have lost weight, color, appetite, voice, or vigor during the winter, and those who have a little coughing to do every day We can easily do this for one month and thereby assist in assuring that nearly or quite every early case is diagnosed But our grand opportunity is to in time make this a consistent, persistent campaign in Kings County throughout the year during every year

The opportunity to serve the county by teaching all of the boys and girls, young men and women, who can be taught, something of first aid in cases of injury, may not seem over attractive to the busy practitioner, but let us get at it with new enthusiasm. Our Trustees have authorized the use of this building for teaching boy scouts these principles on Saturday mornings, and one of our members will be responsible for the conduct of the classes. Let us wish him power and lend him all the help he needs! Some of these boys will be leaders of men hereabouts very soon!

Traffic Safety—Motor traffic still kills by wholesale. This body of educated men whose lives are dedicated to preventing and relieving suffering sense this horror keenly. And

uretero-lithotomy is advised. Stones in the bladder are treated either by a crushing operation through the urethra or a suprapubic cystotomy is done and the stone removed. The question of when to operate is of course a matter of good judgment and there is no doubt that some mistakes have been made in overzealous attempts to make a stone pass down the ureter by manipulation with the ureteral catheter or some of the instruments devised for this purpose. Each case must be judged by the pathology presented as no definite rules can be layed down to govern our action in all

A study of 103 cases taken from hospital and private practice will form a basis for certain conclusions. Of these 79 were males and 22 females. Nothing can be determined from this fact as the work of urologists is chiefly among

60 to 69, inclusive	9
70 to 79, inclusive	2
	103

It will be seen from this that most of these

patients were past middle life

There were 23 of this series which had calculi in the kidneys, 12 were on the right side and 10 on the left side, one patient had stones in both kidneys The diagnosis was made in each instance by finding the stones with X-ray Five passed the stones unaided, on four it was necessary to perform nephrectomy owing to extensive destruction of the kidney, three had pelvio-lithotomy done and in two cases the stone was removed by nephrotomy them still have the stones in the kidney Two of this group died, one from anuria due to stones in both kidneys and the other from a double pyonephrosis. The other five were lost track of so that the subsequent history could not be determined

There were 63 cases of stones in the ureter The distinction between stones in the kidney and stones in the ureter is not great as probably all are renal in origin so they will be considered more or less together. The diagnosis in these cases was based on either the presence definitely determined by combined cystoscopic and X-ray examination or from definite "renal colic" with finding of blood in the urine which quickly cleared up with the subsidence of pain and possibly the actual passing of the stone which was discovered in the urine. The general conception of the cause of renal or ureteral colic is a rough jagged stone scraping its way down the ureter and

each little scrape causing the patient intense agony We believe that it is only when the stone tarries in its journey down the ureter and causes complete though temporary obstruction do we get pain. In other words it is the obstruction to the urinary flow causing distention of the ureter and pelvis above that This is proven by the fact that causes pain we can produce ureteral colic by the injection of fluid through the ureteral catheter We are forced to admit that the passage of a rough jagged stone does cause, often times, perhaps more often than not, enough trauma to the ureter to produce quite a smart hemorrhage but it is probably not true that this trauma is the cause of the accompanying pain 63 cases, 51 passed the stones and five required operation, the remaining 7 still have the stones in the ureters and 2 are under treatment at the present time. In other words about 81 per cent succeeded in getting out of their difficulty without a surgical operation Of the number passed 17 were aided with some form of intra-ureteral manipulation. This 1 think is an interesting observation. If we consider both the renal and ureteral cases together there was a total of 86 and of these 57 passed the stones with or without aid, then from this deduct the five cases which were lost track of. we have 70 per cent passed In other words when a stone starts down the ureter it has a good chance of passing Of the ureteral stones 31 were on the right side and 37 on the left side, 3 on both sides. It is rather difficult to locate these stones as to the portion of the ureter in which they were at the time and as a matter of fact it makes no difference as long as the stone keeps moving. The ureteral stones in which we are chiefly interested are those which become lodged in a saculation above a stricture or become tunneled have definite evidence that a stone will move up the ureter where it is dilated above a stricture, others which were operated on were found definitely incarcerated, mostly due to the large size and rough exterior It has been found that those stones which lodge in the upper or middle ureter are made to pass with greater difficulty than those which are lodged in the lower third It might be well to mention the methods used to urge these stones First an attempt is made by the passage of a plain ureteral catheter which is twisted in an effort to dislodge the stone Sometimes two catheters are passed up the same ureter Occasionally these are left in for 24 or 48 hours Attempts at dilatation are made with the Walther dilator which is a bougie with graduated sized bulbs attached to the end with a fine threaded screw preceded by a small filiform These have proven very efficient dilators in our hands Occasionally

would be done with more alert co-operation and understanding and the expense of every organization would be reduced, therefore more for Brooklyn

Character — Thus we have rapidly and roughly sketched a few of the opportunities for progress which may well be grasped and employed here in order that we may not pile up our sins of omission mounting high. These are some of the thoughts that have thronged as we have considered the honor and responsibility of being chosen as your leader and mentor for the year.

For seventeen hundred busy practical men and women who must earn their livings, to join together in this type of work for mutual and community welfare demands character Our own Cadman recently said "Character is the sole essential foundation of all human progress" We have tons of it roped off in our corral It also requires imagination, which if used in evolving beneficences, acquires a romantic tinge and tone

Some laymen say that the doctor becomes "hardened" We have heard clergymen say that from devoting ourselves to physical affairs we become materialists. But we all realize that we have marvellously constructed material upon which to work, and that there is always a soul housed within. If, therefore, we concern ourselves absorbingly with saving and repairing the house for the sake of the soul, it is really a great adventure.

chosen work Comprehensive organization endeavors should be our sport with which we can round out full days of prolific service. We should turn to it not as dull duty, but with the daring romantic spirit of the poet

"Sail forth! Steer for the deep waters only!

For we are bound where mariner has not yet dared to go"

Nineteen hundred and twenty-eight is the year that now concerns us. To proudly tell and re-tell the splendid story of our society's past as our contribution, would denote age and loss of mental muscle. To merely indulge in fantastic dreams of our palace upon the Acropolis is like the romancing of youth and inexperience. NOW is the fleet, elusive bull that we must tackle by the horns!

From the ancient Sanskrit we treasure this

aphorism

"Look well to this day for it is the very life of life

In it lie all the verities of your existence, The glory of action, The bliss of growth,

The splendor of beauty,

For yesterday is but a dream, and tomorrow is only a vision,

But today well-lived makes every yesterday a dream of happiness,

And every tomorrow a vision of hope Look well therefore to this day"

CLINICAL EXPERIENCES WITH URINARY CALCULI*

By THOMAS F LAURIE, M D, and ALEXANDER MASON, M D, SYRACUSE, N Y

HE management of cases of urinary calculi has undergone somewhat of a change in the last decade owing to the advancement of methods of diagnosis. The cause of these calculi has yet to be determined, many theories have been advanced but none fits every case. It would seem that one of the commonest causes encountered is infection, yet many times calculi are found where at the time no infection exists. From our present knowledge we feel safe in assuming that infection of the kidneys is much more common than was formerly thought and whether or not pyelitis of childhood might not be a cause for the formation of a stone in the kidney is a question for conjecture

The symptoms of stone in the kidney or ureter need not be rehearsed as they are familiar to all Sometimes it is possible to determine the approximate location of a stone in the ureter by the location and character of the pain, but by the use of the cystoscope, the

* Read before the Syracuse Academy of Medicine, May 3, 1927

leaded catheter, roentgen rays and pyelography we are able to determine not only the location but the procedure to be followed in a Our plan has been to perform cystoscopy on every case where possible catheterize the ureters with opaque catheters, and take the X-ray films, both plain and with Sometimes we have used stereopyelogram scopic films to determine whether or not a stone was in the ureter but usually this can be determined by injecting the opaque fluid low down in the ureter thus making an ureteropyelogram If the stone is located in the kidney and is causing symptoms, either pain or signs of infection, we have advised its removal either by nephrotomy or better pelvio-lithotomy If a stone has started down the ureter and is stopped in its descent efforts to make it proceed are attempted by one of the numerous ureteral instruments which have been devised If all attempts to dislodge the stone fail and there are signs that the kidney may be damaged by its continued lodgment there,

uretero-lithotomy is advised. Stones in the bladder are treated either by a crushing operation through the urethra or a suprapubic cystotomy is done and the stone removed. The question of when to operate is of course a matter of good judgment and there is no doubt that some mistakes have been made in overzealous attempts to make a stone pass down the ureter by manipulation with the ureteral catheter or some of the instruments devised for this purpose. Each case must be judged by the pathology presented as no definite rules can be layed down to govern our action in all

It will be seen from this that most of these

patients were past middle life

There were 23 of this series which had calculi in the kidneys, 12 were on the right side and 10 on the left side, one patient had stones The diagnosis was made in in both kidneys each instance by finding the stones with X-ray Five passed the stones unaided, on four it was necessary to perform nephrectomy owing to extensive destruction of the kidney, three had pelvio-lithotomy done and in two cases the stone was removed by nephrotomy them still have the stones in the kidney of this group died, one from anuria due to stones in both kidneys and the other from a double pyonephrosis The other five were lost track of so that the subsequent history could not be determined

There were 63 cases of stones in the ureter The distinction between stones in the kidney and stones in the ureter is not great as probably all are renal in origin so they will be considered more or less together. The diagnosis in these cases was based on either the presence definitely determined by combined cystoscopic and X-ray examination or from definite "renal colic" with finding of blood in the urine which quickly cleared up with the subsidence of pain and possibly the actual passing of the stone which was discovered in the urine. The general conception of the cause of renal or ureteral colic is a rough jagged stone scraping its way down the ureter and

each little scrape causing the patient intense agony We believe that it is only when the stone tarries in its journey down the ureter and causes complete though temporary obstruction do we get pain. In other words it is the obstruction to the urmary flow causing distention of the ureter and pelvis above that This is proven by the fact that causes pain we can produce ureteral colic by the injection of fluid through the ureteral catheter We are forced to admit that the passage of a rough lagged stone does cause, often times, perhaps more often than not, enough trauma to the ureter to produce quite a smart hemorrhage but it is probably not true that this trauma is the cause of the accompanying pain 63 cases, 51 passed the stones and five required operation, the remaining 7 still have the stones in the ureters and 2 are under treatment at the present time. In other words about 81 per cent succeeded in getting out of their difficulty without a surgical operation Of the number passed 17 were aided with some form of intra-ureteral manipulation think is an interesting observation. If we consider both the renal and ureteral cases together there was a total of 86 and of these 57 passed the stones with or without aid, then from this deduct the five cases which were lost track of, we have 70 per cent passed In other words when a stone starts down the ureter it has a good chance of passing Of the ureteral stones 31 were on the right side and 37 on the left side 3 on both sides. It is rather difficult to locate these stones as to the portion of the ureter in which they were at the time and as a matter of fact it makes no difference as long as the stone keeps moving. The ureteral stones in which we are chiefly interested are those which become lodged in a saculation above a stricture or become tunneled have definite evidence that a stone will move up the ureter where it is dilated above a stricture, others which were operated on were found definitely incarcerated, mostly due to the large size and rough exterior It has been found that those stones which lodge in the upper or middle ureter are made to pass with greater difficulty than those which are lodged in the lower third It might be well to mention the methods used to urge these stones First an attempt is made by the passage of a plain ureteral catheter which is twisted in an effort to dislodge the stone Sometimes two catheters are passed up the same ureter Occasionally these are left in for 24 or 48 hours Attempts at dilatation are made with the Walther dilator which is a bougie with graduated sized bulbs attached to the end with a fine threaded screw preceded by a small filiform. These have proven very efficient dilators in our hands Occasionally

graduated sized bulbs incorporated in a catheter or bougie are used. The Livermore dislodger has been tried without great success due we think to the small shaft which was first used in its manufacture. The latest dilator is known as the Dourmashkin after the man who devised it. It is a simple apparatus consisting of a rubber bulb over the end of a catheter which is dilated by injection of fluid from a small glass syringe. This has not been used enough to form a real good opinion as to its value but the principle of it is sound and simple. There are numerous other instruments on the market, only those which were used have been mentioned.

It is of interest to note some of the symptoms and other conditions existing as an accompaniment or possibly as a cause of the calculi present One patient had pyuria as the only symptom of a large branched stone in the left kidney There were two cases of definite hydronephrosis which will probably come eventually to nephrectomy Three had had their appendix removed for right sided pain, one had had a gall bladder operation One had had three previous admissions to the hospital with the diagnosis of colitis and constipation One patient had a double pelvis in each kidney with double ureter on the left side, there were originally three stones in the upper left pelvis, two of these were passed, the third remaining for a period of at least four years and was located in the upper ureter above a stricture, attempt to remove this by ureterolithotomy failed owing to the fact that the stone went back up into the hydronephrotic upper pelvis A subsequent nephrectomy was done One patient had a double pelvis with a single ureter, on the left side. In one of the cases of uretero-lithotomy there was a recurrence of the stone at the same place about two There was one patient with a years later large spindle shaped stone in the lower third of the right ureter who had had pain in the right side for 20 years Thirty-seven were the largest number of stones passed by one man over a period of years

Calculi of the bladder are not quite so common as those of the upper urinary tract, possibly for the reason that those which originate in the kidney do not rest long in the bladder after they reach that viscus although occasionally they have to be removed transurethrally Just how many originate in the bladder it is hard to say but if a large calculus is found back of a prostatic obstruction it seems reasonable to assume that it was formed there as a result of the urinary stasis Included in this series are 18 with bladder stones youngest was 14 and the oldest 73, males 16 This predominence of males and females 2 over females can be easily accounted for by

the fact that women do not have prostates Ten were removed by suprapubic cystotomy most of them in the course of a prostectomy, six were removed by a crushing operation, either with a lithotrite or rongeur, one passed out through the urethra and one was lost track of For the most part the diagnosis was made with the cystoscope

In considering the methods of removing stone from the bladder we must first know the actual conditions existing at the neck of the bladder or in other words a thorough search must be made for a possible cause of the formation of the stone. If there is distinct obstruction at the vesical neck with the presence of stone it would be foolish to attempt any crushing operation except in a very rare instance of some inoperable condition, because the stone would probably reform. There is also sometimes more shock to a crushing operation than to a suprapubic cystotomy.

Of these stones removed from the bladder there was no doubt that five of them had originated in the kidney, one of the women included in this list had a sponge in the bladder as a result of a Watkins interposition operation This sponge was with a stone formed on it removed by suprapubic cystotomy the cases mentioned above in the list of ureteral calculi had a stone removed from the bladder about three years previously patient had a distinct contraction ring at the vesical neck which was treated with the Punch Another of the patients included in the list of ureteral cases passed his stone into the bladder but in attempting to pass it out it got stuck in the posterior urethra, which necessitated pushing it back into the bladder and crushing it One patient had a nest of stones in the prostate as well as the one in the bladder

From the above study the following conclusions can be drawn

1 Stasis of urine anywhere along the urinary tract favors the formation of stones

2 If a stone gets into the ureter it has an 81 per cent chance of passing down into the bladder

3 Stones in the urcter may be helped to pass by manipulation with instruments in the ureter

4 Most of the stones which reach the bladder pass out through the urethra unaided

5 Before stones are removed from the bladder by any means a thorough knowledge of the condition of the vesical neck must be obtained by cystoscopic examination

6 With the history, physical examination, use of the cystoscope, X-ray and ureteral catheters we now have good command of the situation and with good judgment can deal with it intelligently

ACUTE INTESTINAL OBSTRUCTION*

With Report of Sixty Cases

By LEW H FINCH, MD, FA.CS, AMSTERDAM, N Y

A NY disease which under the best treatment of medical science today exacts a mortality toll of over 50 per cent is surely worthy of the most serious consideration. Such a disease is acute intestinal obstruction.

Since the advent of antiseptic surgery there has been a gradual diminution both in mortality and morbidity, so that today operative procedures which less than forty years ago would have been deemed too hazardous are faced now with a degree of certainty little

dreamed of in a generation past

Only three score years ago Dr Gross, professor of surgery in Philadelphia, contemplating the advisability of removing a goitre, stated that no sane and sensible man would attempt its removal. Indeed, he remarked it was questionable whether the gland could ever be safely removed. What would be his reaction if today, he could see almost any type of goitre attacked with impunity, and discovered a mortality record of less than two per cent in the best hands.

In no field of surgical endeavor has there been greater advance than that of the abdomen with the sole exception of this ugly and baffling condition, intestinal obstruction. Indeed, in many lines surgery has reached apparently the limit as far as asepsis, technic, pre- and post-operative care, mortality and morbidity are concerned. Further progress will undoubtedly be along the line of anesthetics and methods of induction.

In view of the above, why is it that we have fallen so far behind in the case of intestinal obstruction, a disease more fatal than appendicitis, ectopic gestation, gall bladder and even perforative lesions Moynihan has stated in his recent work that few surgeons in any series of over twenty cases can show a mortality of less than 50 per cent I believe there are many reasons for this which will bear frequent and careful review First and foremost, I believe the fault has been an educational How many of us remember our college lectures on this subject? How much time was spent presenting this dreadful condition before us by word, illustration, and case report, that we might realize what a serious condition it really was Yet there are few of us I feel who have not carried away from lecture room and hospital service, a very definite and vivid picture of appendicitis ectopic and acute per-Has not this failure to properly evaluate this disease had something to do with the delay which is so common in insisting on surgical treatment? Over 90 per cent of these cases die under medical treatment, only 10 per cent would be sacrificed if the physician could realize the seriousness of this disease, diagnose his case early and insist on laparotomy

Coincident with the high mortality following treatment of cases seen in the late stages, has been the reticence of some men in reporting their series—for the very reason, a high mortality. They fail to realize that this very fact may be the impetus which will lead other men to more careful study. We have goitre statistics by the thousands, cancer and ulcer of the stomach by the tens of thousands and the same may be said of the gall bladder, appendix, uterine and kidney lesions, but when we come to intestinal obstruction, there are few series running into the hundreds. This is not due to the less frequent occurrence of the disease although it has a definite bearing.

No conscientious surgeon who has done much operative work is not struck with terror when called upon to treat a case of intestinal obstruction The first question he asks is, "How long has the patient been sick?" The reply, so frequent, "fecal vomiting for one, two or three days," or as in a case recently treated by the writer, in which the patient had vomited sterocaceous material ten How long will it be before we days before learn that fecal vomiting is one of the terminal symtoms and a surgeon called at this time is generally soon followed by the undertaker Score the internist not the surgeon and do not say it was "God's will," but rather our own ignorance

From this failure to properly assess the disease has followed the failure to diagnose and consequent delay. Personally, I believe we should make early diagnosis in 90 per cent of these cases. In arriving at this end more will be gained by a careful history of the case, especially previous illnesses including operative procedures and mode of onset. This followed by a careful inspection, palpation and percussion of the abdomen should in a great majority of the cases establish a diagnosis. If in doubt and no force, flatus or feces in second enematy, operate

I ven though it may appear academic. I have thought it best to review the disease briefly as to etiology, symptomatology, diagnosis and treatment. During the past few years much that is new has appeared which I feel may be of help in treating this malady. A great deal of experimental work has been done to

^{*}Rend at Annual Meeting of Fourth District Branch of the Melical Society of the State of New York at Schenectady N Y October 12 1927

produce artificially in animals the condition found in the human. Hausler and Foster to eliminate the factor of profound narcosis have under local anesthetic. (1) produced blockage of lumen of bowel without any apparent involvement of circulation. (2) Acute strangulation with involvement of blood vessels, lymph and nerve supply. These conditions parallel closely two types found in the human, namely, the first as seen in block or obstruction from calculi, foreign bodies, with little or no involvement of the circulation and second, the strangulated type, best exemplified in strangulated hernia, volvulus, and intussus-

In studying the causes of death in intestinal obstruction the same workers have considered shock, bacteriemia, toxiemia, dehydration, amount of bowel involved and degree of venous occlusion They believe that the condition closely simulates that seen in complete starvation and that this latter is the greatest factor in the cause of death. They have proven that toxiemia and retention of production is not the sole cause However, no one factor but rather a combination varying in different types, are the cause Bio-chemical studies have revealed that the blood picture is similar to that found in starvation, viz, high hemoglobin and red blood count, increase viscosity and lowered blood volume Haden and Orr have noted increased dehydration, lowering of blood chlorides and a frequent tendency toward alkalosis A fall in chlorides is noted in every case and an increase in CO₂ combining power followed very frequently Vicar in his metabolism studies of high obstruction calls attention to similarity of acute intestinal obstruction to that of uremia, in chronic nephritis, marked retention of nitrogenous waste products and high blood urea. He also noted a lowering of the blood chlorides

All cases of obstruction fall under one of two great types, the dynamic and the mechanical The dynamic is due to a paralytic condition of the intestinal wall and is most frequently seen following acute appendicitis or septic peritoritis. This type is also frequently found following torsion of intra-abdominal viscera as in ovarian cysts, pedicled tumors of the kidneys, spleen, or uterus or viscera which have acquired long ligamentous attachment. These conditions are frequently accompanied by sterile peritoritis. Involvement of the blood vessels either by embolus or thrombosis will produce similar conditions which however soon result in necrosis and speedy death

The second great division of obstruction is the mechanical and this is by far the most frequently seen. In this group occur the cases of strangulation either by viscera passing through normal or acquired openings or by sliding under bands producing external or internal hernia Then follows kinking of the bowels by bands, result of previous inflammatory reaction either from disease or operative interference, volvulus, intussusception Blocking by calculi or foreign bodies follow in the order mentioned

There are possible a hundred different causes for acute intestinal obstruction but for all practical purposes one who remembers the following will be prepared to meet the remaining

- 1 Strangulation by band, adhesions or through openings Under this head, all the hernias
- 2 Acute localized paralysis due to infection, most frequently seen following suppurative appendix
- 3 Strangulation or kinking from bands
- 4 Volvulus
- 5 Acute intussusception
- 6 Acute obstruction in chronic obstruction
- 7 Impaction of foreign bodies

When we consider symptoms, it is well to remember that the general signs are those most frequently found in strangulated herma There are, however, three major sign-posts which we (1) Pain should constantly remember (3) Constipation which is generally Vomiting absolute Although there are many other symptoms which vary with the cause, severity and extent of obstruction these three should in a great majority of cases put us on our guard and en-Shock, disable us to make an early diagnosis tension, low temperature, rapid pulse, rigidity, Hippocratic facies, visible peristalsis may occur in many cases but let us not forget that pain, vomiting, constipation occur in every case and in Sudden acute abdominal pain the order stated should always be a danger signal in the face of the conscientious physician and he who in spite of this warming dulls the patient's sensorium and lulls his own reasoning factors by administering morphine is headed for disaster which will soon manitest itself in the form of fecal vomiting To parody a boyhood rhyme, he who treats with morphine and runs away will live to regret another No physician should administer morphine unless he is reasonably sure of diagnosis after a thorough history and physical examination is a simple statement but one most frequently The administering of morphine is disregarded the greatest factor in the production of bad results Accompanying the pain shock often occurs and is especially seen in those cases of high obstruction The shock differs from that seen in many other intra-abdominal lesions in that it frequently passes over but the pain persists Voniting accompanies pain or closely follows it First gastric contents, then bile-stained material and later stercoraceous or fecal material. This varies with site and character of obstruction and is most

severe and exhaustive in high lesions The cause of vomiting is a disputed point Several theories have been advanced such as anti-peritstalsis, peristalsis, with a regurgitant axial stream, etc There must, however, be a great nervous influence in its causation as we have all seen it occur where only the omentum had become incarcerated with no involvement of the lumen of the bowel account of the increased sensitiveness of the nervous system it is most commonly seen in children and women and in that part of the bowel most richly supplied with nerve tissue, namely the small Hiccough, or regurgitation of mouthintestine fuls of fluid are probably dependent on a reflex disturbance and should always be considered of serious import Constipation is the most variable of the major symptoms In many cases fair results may be obtained at first Absolute consupation coming only when the block is complete or peritonitis, perforation or thrombosis has developed. This condition is occasionally seen in the Richter hernia where only a portion of the lumen of the bowel is involved. Very frequently the lower bowel may empty itself and thus delude the careless observer Absence of force, flatus, feces with repeated enemata and continued vomiting indicate that the obstruction persists. Absolute constipation is followed sooner or later by This is often very slight where the lesion is high as in the jejunum and duodenum, but marked in the involvement of the large bowel especially in the case of volvulus and where the sigmoid is involved. Meteorism has been produced experimentally by ligation of the nerves of the mesentery. This condition occurs in strangulation and with involvement of the blood and nerve supply Visible peristalsis or coils of bowels generally indicate obstruction in the right lower abdomen or pelvis and are most commonly seen in the chronic type of case

There are few conditions which the medical man is called upon to treat where mistakes in diagnosis, result in such a tragic mortality should not be a difficult test to diagnose acute intestinal obstruction in the great majority of The character of the obstruction may be very difficult to foretell, however no operator will criticize physician for having failed to diagnose the nature of the obstruction if he will only recognize that an early obstruction exists Better an early operation in the hands of a poor surgeon than a late one in the hands of a master In arriving at diagnosis the greatest value must be assigned to a careful history of the case it not true that the more proficient a man becomes either as a physician or surgeon the more careful he is in securing detailed listory field of medicine is this so well rewarded as in abdominal work Movinhan stated that the diagnosis of duodenal ulcer can be made from the history alone in a great majority of cases. It is safe to say that almost 50% of abdominal conditions can be diagnosed by careful history Only the tyro in the field of surgery will rush ahead without a careful history and analysis of the case. In a recent article Deaver stated briefly of a case seen in consultation with Dr. Reginald Fitz. The patient presented a serious abdominal lesion Dr. Fitz spent one hour in questioning the physician in charge. Made a diagnosis of acute pancreatitis. Took five minutes for a physical examination. Diagnosis confirmed by operation

Diagnostic errors represent our greatest crimes in medicine today. Richard Cabot was widely criticized for his glaring statement in regard to the failures in diagnosis. Yet how few could show a better record if cases could be checked up by operative or post-mortem record? We cannot spend too much time in obtaining all possible evidence both from the patient, family, and attending physician

The patient should be carefully questioned as to previous operations, whether drain had been used or not, inflammatory lesions, previous health, history of similar attacks, onset of pain, character and persistence, vomiting, constipation, blood in movements, appearance of tumor mass, have opiates been administered or cathartics given?

We are now ready for the physical examination and less mistakes and oversights will be made if we develop a regular routine in approaching these cases. First, inspection. We should note the patient's position, attitude, facial expression, color, whether emaciated or not, temperament. No inspection of abdomen without all clothing removed should be permitted. General contour, irregularities, distension, peristalsis, with special attention to possible herma. Palpation should follow first at those sites where herma may occur. Especial care should be given in obese subjects and when examining for femoral herma as Richter herma in these subjects may at times be almost impossible to detect.

The remaining portion of the abdomen should then be covered for tumor masses, rigidity, painful spots, and cutaneous hyperaesthesia. careful examiner will not forget the vaginal and rectal orifices and the appearance of abdominal scars, bearing in mind the factor previous operations have in causation of this disease of the stethoscope on the abdomen occasionally rewards the examiner in a most unexpected This valuable instrument has a field of usefulness in the abdomen as well as in the chest The use of the thermometer, blood pressure apparatus, stomach tube and finally blood chemistry will generally place us in a position to give a careful, differential diagnosis. In this we should keep before us the three major symptoms, the presence of abdominal scars, the age of patient, and consider the common things first as, hernia, post-operative conditions, torsion of the viscera Remember that volvulus rarely

occurs before the fortieth year and a great majority of intussusception are in infants under one Tumor mass appears in about 60% of intussusception and bloody stools in a trifle higher percentage Try to determine whether the case is paralytic or mechanical, acute or chronic, site and nature of obstruction Remember that visible peristalsis generally occurs in chronic cases Vomiting is early and persisting in high cases, with early shock and marked prostration from dehydration Thirst is severe, flatus and fecal material pass. In lower ileum and cecum, feces and flatus do not pass, distension is in the mid In this type of lesion visible peristalsis is most frequently observed

The colon and rectum are the most common sites for chronic cases, initial collapse is slight, distension often great, voiniting occasionally late Enemata are not retained, or only in small

amounts

A few surgical don'ts may help in arriving at a diagnosis and materially improve the chances

of the patient

- 1 Don't use morphine, it masks symptoms, deadens the physician's reasoning, induces intestinal paralysis, promotes accumulation of toxins in bowels, hastens the patient on the road to dissolution
- 2 Don't use purgatives They increase pain and vomiting, the family have generally given castor oil
- , 3 Don't fail to use rectal and stomach tubes Repeated enemata are the best medical treatment we can render
- 4 Don't delay laparotomy Fecal vomiting, hiccough, paralyzed bowel are terminal symptoms

The treatment of the disease should be considered surgical Early exploratory laparotomy is the best advice we can give the patient. Remember Agnew's famous remarks, never let the sun go down on a case of strangulated hernia, and this applies to all cases of intestinal obstructions Medical treatment has a mortality of 90% The seriousness of the case increases with A lowering of mortality from 50 to delay around 10% could be obtained if diagnosis was We have obtained this in appendimade early cal lesions, why not here? Delay not only adds to the severity of the symptoms, but increases the extent and severity of surgery, thereby increasing the risk at both ends

In operation two main objects should be obtained. First to relieve the obstruction, second, to empty the distended bowel. The former is only feasible where the case is seen early, the latter should always be secured. No operation should be considered completed that does not relieve distension and empty the dilated bowel of its toxic contents. In late cases, if the obstruction is not readily found, external enterostomy should be done utilizing first distended loop that

presents itself in a midline incision. Repeated observations have proven that this is generally the most favorable site. Prolonged exploration will generally confirm this as the site for external In obscure cases suprapubic midline incision is best Exploration should first be made in the right iliac fossa and pelvis and next in the sigmoid region. With careful handling and protection of the bowels by saline packs, evisceration and thorough inspection is permissible in obscure cases guarding against too much traction on the mesentery In chronic cases or acute obstruction of chronic case, preliminary drainage should always be done. As most of these cases are in the colon, cecostomy is the safest procedure With considerable distension of the bowel, liberation of gas and removal of fluid contents is In the case of strangulation, disnecessary tended loop above should be emptied into the lower collapsed loop providing the viability of the If not, contents should be rebowel is good moved by trocar and canula or a similar device. If the condition of the bowel is questionable, it should not be returned to the peritoneal cavity This is especially deceptive in some cases of Richter hernia High jejunostomy, while approved by many good surgeons, has not been finally The work of Hayden and Orr reveal that in high obstructions jejunostomy hastens a fatal This condition only increases dehydration and alkalosis, the animal dying in three to four days, while if left without a jejunostomy the duration was nine days In cases where jejunostomy has been done, frequent irrigation of the bowel with strong salt solutions should be The above workers found that this prolonged life more than any other treatment

Don't forget that many cases of apparent acute dilatation of the stomach are in reality cases of obstruction. These follow acute infective cases, especially suppurative appendix. If relief is not afforded by a few closely repeated gastric lavages and enemata, suspect obstruction and explore

The choice of anesthesia is a very serious The use of ether 15 question in these cases justified by many, providing a preliminary lavage of the stomach is made However, any one who has followed these cases, realizes that the regurgitant stream fills the stomach almost as fast as it is emptied. By the time the case is under anesthesia and the operation under way, the stomach is again filled. How many cases have been lost by the aspiration of this septic toxic fluid into the lungs, during the operation, we can little imagine Personally I have given up the use of ether in these cases and rely on local infiltration of the abdominal wall or spinal anesthesia, providing there are no serious contraindications, to the latter Any one who has used spinal anesthesia in these cases appreciates the great assistance afforded by the complete muscle relaxation of the abdominal wall llowever, no one should use this anesthesia unless they are able to combat occasional complications by the very excellent line of treatment advocated by Babcock. Of course exploration is a bit more difficult and must be made in a very gentle manner. This however, is in one way a decided benefit to the patient. The post-operative course is so much smoother in spinal cases that it more than compensates for its trouble.

The post-operative care is not the least important part in the treatment Maintenance of tissue fluid and chloride supply is best secured by intravenous glucose solution 10 per cent in normal saline. This may be administered at regular intervals or given by the Matas Nothing less than 2000 cc and better method 3000 and 4000 cc should be given in twentyfour hours, watching carefully the heart and urmary output The tongue is one of the best post-operative indicators we have, especially in adults and should be as carefully scrutinized as the pulse and temperature record Remember that no case with a dry tongue is right and very few with a moist tongue wrong

Many a case has been tided over a stormy period by the frequent use of the gastric tube and many more can be saved by persistent use of intravenous glucose and saline. Nothing in recent years has been of such great help in the writer's hands as the latter This treatment is especially indicated in either acidosis or alkalosis and in many cases results have been mar-I have no faith whatever in the use of sodium bicarbonate, intravenously and believe its use's dangerous in the hands of one who is not in close touch with the laboratory where the CO² combining power can be quickly determined Glucose and saline are the best stimulants and diuretics we have in the great majority of desperate post-operative cases Drugs have a very limited role We have rehed on them too much Let us not follow blind guides but have some reason for the faith that is in us

Conclusion

1 Acute intestinal obstruction is one of the most serious, if not the most serious condition the physician is called to treat

2 Mortality can be reduced 40 per cent by

early diagnosis and correct treatment

3 Few diseases give such a clear cut picture. There are three major symptoms that never fail and on these alone diagnosis can be made.

4 Morphnie is dangerous drug in this disease. It causes delay, increases symptoms, renders operation more difficult and frequently silences the patient forever. It has been the

cause of more bad results than any other factor

- 5 Treatment is operative. Two results are to be obtained
 - a Relief of obstruction
 - b Emptying of distended bowel

In early cases under twenty-four hours, relief of obstruction is all that is necessary. In late cases second object is best, that is emptying the bowel by the simplest method. Do not attempt too much in the late case. Drain the first loop, use the stomach and rectal tube freely and don't forget intravenous glucose and saline.

Following is a resume of cases occurring in the writer's practice, extending over a period of seventeen years. Only important points have been emphasized as duration, pathology, site and nature, type of operation used, and results. I believe something may be learned from perusal of this record.

RESUME 60 CASES OF INTESTINAL OBSTRUCTION

Case 1 Miss J D Age 13 Operated acute appendicitis September 24, 1910 On the 27th vomited, increasing distension was called to treat case on account of absence of the physician who had operated the case before Found adhesions at the site of the drain, Midline external enterostomy first loop of bowel presenting with rubber tube drain Speedy recovery Bowel closed spontaneously

Case 2 Mrs J S Age 39 Pelvic operation post-operative adhesions, persistent vomiting, operated second day following Loop of ileum adherent in pelvis External enterostomy with tube Good recovery, secondary closure not required

Case 3 Mrs J K Age 81 Onset April 2, 1914, operated April 5, 1914, small umbilical herma, torsion of transverse colon Local anesthesia, bowel reduced, good recovery

Case 4 Mrs F H Age 56 Onset April 19, 1914, operated April 21, 1914, strangulated femoral hernia, reduced under ether, recovery

Case 5 Mr C R Age 24 Onset May 10, 1914, operated May 11 Right strangulated inguinal hernia, reduced under ether Recovery

Case 6 Miss C B Age 28 Onset May 21, 1914, operated May 22, 1914 Post-operative occlusion of sigmoid following removal of a very large fibroid of uterus Sigmoido-sigmoidostomy with external enterostomy of lower ileum by tube Ether anesthesia, recovery

Case 7 Miss E Mc Age 31 Onset May 16, 1915, operated May 18, 1915 Pelvic adhesions lower ileum, external enterostomy, secondary

closure not required, early recovery

Case 8 Mr J C Age 79 Onset June 17, 1915, operated June 17, 1915 Right strangulated inguinal hernia, Richter type, bowel ne-

occurs before the fortieth year and a great majority of intussusception are in infants under one year Tumor mass appears in about 60% of intussusception and bloody stools in a trifle higher Try to determine whether the case percentage is paralytic or mechanical, acute or chronic, site and nature of obstruction Remember that visible peristalsis generally occurs in chronic cases Vonuting is early and persisting in high cases, with early shock and marked prostration from dehydration Thirst is severe, flatus and fecal material pass. In lower ileum and cecum, feces and flatus do not pass, distension is in the mid In this type of lesion visible peristalsis is most frequently observed

The colon and rectum are the most common sites for chronic cases, initial collapse is slight, distension often great, vomiting occasionally late Enemata are not retained, or only in small

amounts

A few surgical don'ts may help in arriving at a diagnosis and materially improve the chances

ot the patient

1 Don't use morphine, it masks symptoms, deadens the physician's reasoning, induces intestinal paralysis, promotes accumulation of toxins in bowels, hastens the patient on the road to dissolution

- 2 Don't use purgatives They increase pain and vomiting, the family have generally given castor oil
- · 3 Don't fail to use rectal and stomach tubes Repeated enemata are the best medical treatment we can render
- 4 Don't delay laparotomy Fecal vomiting, hiccough, paralyzed bowel are terminal symptoms

The treatment of the disease should be considered surgical Early exploratory laparotomy is the best advice we can give the patient. Remember Agnew's famous remarks, never let the sun go down on a case of strangulated hernia, and this applies to all cases of intestinal obstructions Medical treatment has a mortality of The seriousness of the case increases with 90% delay A lowering of mortality from 50 to around 10% could be obtained if diagnosis was made early We have obtained this in appendical lesions, why not here? Delay not only adds to the severity of the symptoms, but increases the extent and severity of surgery, thereby increasing the risk at both ends

In operation two main objects should be obtained First to relieve the obstruction; second, to empty the distended bowel. The former is only feasible where the case is seen early, the latter should always be secured. No operation should be considered completed that does not relieve distension and empty the dilated bowel of its toxic contents. In late cases, if the obstruction is not readily found, external enterostomy should be done utilizing first distended loop that

presents itself in a midline incision observations have proven that this is generally the most favorable site. Prolonged exploration will generally confirm this as the site for external anastomosis In obscure cases suprapuble midline incision is best. Exploration should first be made in the right iliac fossa and pelvis and next in the sigmoid region. With careful handling and protection of the bowels by saline packs, evisceration and thorough inspection is permissible in obscure cases guarding against too much traction In chronic cases or acute on the mesentery obstruction of chronic case, preliminary drainage should always be done. As most of these cases are in the colon, cecostomy is the safest procedure. With considerable distension of the bowel, liberation of gas and removal of fluid contents is In the case of strangulation, disnccessary tended loop above should be emptied into the lower collapsed loop providing the viability of the If not, contents should be rebowel is good moved by trocar and canula or a similar device. It the condition of the bowel is questionable, it should not be returned to the peritoneal cavity This is especially deceptive in some cases of Richter hernia High jejunostomy, while approved by many good surgeons, has not been finally settled The work of Hayden and Orr reveal that in high obstructions jejunostomy hastens a fatal This condition only increases dehydration and alkalosis, the animal dying in three to four days, while if left without a jejunostomy the duration was nine days. In cases where jejunostomy has been done, frequent irrigation of the bowel with strong salt solutions should be The above workers found that this prolonged life more than any other treatment

Don't forget that many cases of apparent acute dilatation of the stomach are in reality cases of obstruction. These follow acute infective cases, especially suppurative appendix. If relief is not afforded by a few closely repeated gastric lavages and enemata, suspect obstruction and explore

The choice of anesthesia is a very serious question in these cases The use of ether is justified by many, providing a preliminary lavage of the stomach is made However, any one who has followed these cases, realizes that the regurgitant stream fills the stomach almost as By the time the case is fast as it is emptied under anesthesia and the operation under way, the stomach is again filled How many cases have been lost by the aspiration of this septic toxic fluid into the lungs, during the operation, we can little imagine Personally I have given up the use of ether in these cases and rely on local infiltration of the abdominal wall or spinal anesthesia, providing there are no serious contraindications, to the latter Any one who has used spinal anesthesia in these cases appretumor mass appeared at the inguinal ring and

previous operation complicated symptoms

Case 30 Mrs O H D Age 61 Onset April 30, 1922, operated May 3, 1922 Gall stone occluding ileocecal valve Stone pushed back, bowel incised, calculus removed, closed, under Recovery ether

Age 15 Onset November Case 31 K. H 3, 1922, operated November 7, 1922 Band from appendix to site of right pelvis under which loop of ileum had passed and strangulated Band divided, bowel reduced under ether Recovery

Case 32 Mrs J K. Age 32 Onset February 26, 1923, operated February 27, 1923 operative incisional hernia, obstruction Bowel liberated, reduced under ether Recovery

Case 33 Mr J M Age 46 Onset May 18, 1923, operated May 22, 1923 Acute obstruction in carcinoma sigmoid Resection under ether Death in four days (Comment)—Mis-

take in not doing preliminary cecostomy

Case 34 Mrs J V Age 58 June 11, 1923, operated June 14, 1923 Post-operative adhesions with obstruction colon to gall bladder wound, local anesthesia External drainage, re-

Case 35 Mrs F C Age 70 Onset September 14, 1924, operated September 17, 1924 Right strangulated femoral herma, reduction and hermi-

otomy under ether Recovery Case 36 Mrs F W H Age 45 Onset November 29, 1924, operated December 3, 1924 Post-operative incisional hernia with torsion of momentum, reduced by chloroform anesthesia-

wound closure Recovery Case 37 Mr C E N Age 73 Onset November 26, 1924, operated November 29, 1924 Post-operative adhesion of ileum to pelvis Ex-

ternal drainage under ether Death

Case 38 Mr J M Age 61 Onset November 27, 1924, operated November 27, 1924 Postoperative adhesion Reduction and division of

adhesion under ether Recovery
Case 39 Mr W J S Age Age 37 Onset December 18, 1924, operated December 28, 1924 Post-operative internal hemorrhage followed by adhesion which obstructed on the tenth day Ether anesthesia External drainage, recovery

Case 40 Mrs W Age 72 Onset March 31, 1925, operated April 7, 1925 Strangulated right femoral hernia of the Richter type Bowel gangrenous Resection under local anesthesia Endto-end anastomosis Death

Mrs C E Age 39 Onset Janu-Case 41 ary 25 1926, operated January 26, 1926 Adhesion to ileum to a hemorrhagic cyst to right ovary which had ruptured Division of band and removal of ovary under ether Recovery

Mr F L Age 19 Onset February 1, 1926, operated February 1, 1926 Pentonitis following gunshot wound Enterostomy under ether and recovery

Case 43 Mr. C R Age 26 Onset March 21, 1926, operated March 22, 1926 Meckel's diverticulum, adherent to pelvic rim Marked torsion of the bowel and mesentery thrombosis Resection of bowel and mesentery End-to-end anastomosis, under ether

Case 44 Mr C R. Age 26 Above case continued obstruction from mesentery thrombosis External enterostomy was done, local anes-

thesia, but no relief obtained Death

Case 45 Mrs I H Age 62 Onset August
27, 1926, operated September 1, 1926 Acute obstruction in annular carcinoma of splenic flexure Mickulicz two-stage operation First under ether Recovery

Mrs C W Age 60 Onset Sep-Case 46 tember 8, 1926, operated September 12, 1926 Band across terminal ileum Band divided cecostomy under local anesthesia Death

ment)—Case seen too late for surgery

Case 47 Mr W H F Age 58 Onset October 1, 1926, operated October 5, 1926 obstruction in chronic peritoneal tuberculosis Multiple annular bands about ileum, eight or Lateral anastomosis above and below in spite of lesions Under ether Recovery

Case 48 Miss A D Age 25 Onset October 4, 1926, operated October 6, 1926 operative adhesion ileum to pelvis from previous operation for pus tubes Liberation of bowel and

reduction under ether Recovery

Case 49 Mrs J R Age 62 Onset October 8, 1926, operated October 13, 1926 Strangulated right femoral herma, Richter type Bowel and omentum necrotic Resection of gangrenous areas Bowel anastomosed and sutured to peritoneal cavity site of incision. Local anesthesia Recovery

Case 50 Mr C C Age 78 Onset October 11, 1926, operated same day Strangulated right inguinal hernia Bowel gangrenous Lateral anastomosis ileum above and below loop under

local anesthesia Death

Case 51 Mrs W C Age 41 Onset October 13, 1926, operated October 13, 1926 Postoperative adhesion from jejunum to round of mesentery under which loop of bowel had slid Very marked hemorrhagic areas in bowel, free blood in mesentery vessels Operation under Case considered hopeless Uneventful convalescence after two days

Case 52 Mr G W Age 42 Onset November 1, 1926, operated November 4, 1926 Acute obstruction of chronic peritoneal tuberculosis Internal anastomosis ileum to ileum under ether Recovery

Case 53 Mrs C E Age 39 Onset December 31, 1926, operated January 1, 1927 Adhesion of ileum to pelvic contents following operation for intestinal obstruction one year ago Liberation and reduction under ether Recovery

crotic External anastomosis, ether anesthesia

Recovery

Case 9 Mr P B Age 57 Onset August 23, 1915, operated August 25, 1915 Obstruction just below duodeno-jejunal angle due to an annular lympho-sarcoma Resection including mesentery with large nodes, lateral anastomosis Ether anesthesia Recovery

(Above case is well after ten years Had been treated for constipation in Dr Cabot's clinic at

Boston previous to consulting me)

Case 10 Mrs B P Age 60 Onset October 16, 1915, operated October 18, 1915 Adhesion. ileum to pelvic contents, post-operative Aspiration and external drainage by enterostomy Ether anesthesia Death in three hours from shock Local anesthesia should have been used in this

Case 11 Miss A M Age 15 Onset May 13, 1916 Operated May 14, 1916 Post-operative suppurative appendicitis, adhesion of ileum to pelvis around drain External enterostomy by tube Ether anesthesia, recovery

Case 12 Mrs S P Age 36 Onset March 16, 1916 Operated March 18, 1916 Left strangulated inguinal hernia Reduction under ether

anesthesia, recovery

Case 13 Mrs A. S Age 53 Onset December 3, 1916, operated December 6, 1916 Incisional herma, sigmoid obstruction Reduced un-

der ether anesthesia Recovery

Case 14 Mrs J S Age 57 Onset December 9, 1916, operated December 15, 1916 Adhesion of ileum to pelvic contents with torsion External enterostomy and aspiration under ether Death in four hours (Comment) —local anesthesia should have been used seen too late

Master R J Age 10 Onset July Case 15 11, 1917, seen in consultation first, July 14 Im-Slit in mesentery mediate operation advised with herma of ileum Marked torsion of bowel and mesentery thrombosis Aspiration and re-Case died in 36 hours following opera-(Comment)—Case seen too late avoidable fatality on account of mesentery throm-

Case 16 Miss K. L. Age 71 Onset November 27, 1917, operated November 28, 1917 Strangulated right inguinal hernia with mesenteric thrombosis Bowel gangrenous External enterostomy under ether, patient died from shock and toxemia on the third day

Case 17 Master R J Age 51/2 months Onset February 7, 1918, operated February 8, 1918 Intussusception lower ileum and cecum extending to splenic flexure Reduction under ether Death in 15 hours

Case 18 Mrs C V Age 53 Onset February 8, 1918, operated February 10, 1918 hesion from sigmoid to fundus of uterus under which loop of ileum had passed and strangulated

External enterostomy under ether Death five hours from shock and toxemia

Case 19 Mr C L Age 48 Onset May 25, 1918, kicked over pubic region by horse Operated May 26, 1918 Traumatic perforation of ileum, localized peritonitis External enterostomy through perforation Death in 6 hours from shock and sepsis

Case 20 Mrs L H C Age 40 Onset August 27, 1918, operated August 28, 1918 Adhesion of ileum to fundus of uterus following old Baldy-Webster operation Liberation and reduction, division of adhesion, under ether Recov-

ery

Case 21 Mr A M P Age 39 Onset August 28, 1918, operated August 30, 1918 Postoperative appendiceal adhesion, ileum to pelvis Reduction under ether around site of drain Recovery

Case 22 Mrs W S Age 74 Onset September 12, 1918, operated same day Strangulated right femoral hernia Reduction under

ether Recovery

Case 23 Miss E M Age 15 Onset July 12, 1920 Operated July 16, 1920 Acute obstruction of an old chronic generalized peritonitis, probably influenzal in origin External drainage under ether Death Post-mortem examination revealed chronic fibronous peritonitis, primary etiology undetermined

Care 24 Mr J C Age 14 Onset September 25, 1920, operated same day Post-operative adhesion of ileum to pelvis with perforations Primary operation was for from a fecolith drainage only Closure of perforation, reduction under ether Recovery

Case 25 Mrs A P Age 65 Onset November 10, 1920 Operated November 11, 1920 Incisional hernia with involvement of ileum and sig-Adhesions divided, moid with strangulation bowel reduced, under ether Recovery

Case 26 Mr F C Age 34 Onset January 7, 1921, operated January 8, 1921 Incisional herma through old appendiceal wound Strangulated hernia with mesenteric thrombosis Resec-(Comment)—Too tion under ether Death much surgery attempted

Case 27 Mr C H V Age 31 Onset January 13, 1921, operated January 14, 1921 Postoperative band, torsion jejunum Resection of bowel, end-to-end anastomosis Death in one day (Comment)—Too much surgery attempted

Case 28 Mr L L Age 46 Onset May 20, 1921, operated May 24, 1921 Large fecolith in

colon Ether anesthesia Recovery

Mrs S D Age 49 Case 29 Onset April 18, 1922, operated April 21, 1922 Strangulated Richter hernia, right inguinal, occurring three days following operation for gall bladder duction under ether Death (Comment)-Diagnosis rendered difficult in above case as no

overlie the organs affected This is best seen in acute intra-abdominal diseases where the ab-

dominal wall muscles become rigid

Pain resulting from cardiac affections is, like her visceral pain, referred The surfaces afother visceral pain, referred tected are the chest, left shoulder, arm and forearm, especially ulnar side, and outer two fingers Occasionally also the right arm, left side of neck, orbital region, left ear and lower jaw may be affected The viscero-motor reflex gives a sensation of constriction of the chest due to contraction of the intercostal muscles, and if the impulses are strong we may also get the reflexes affecting other organs such as the salivary glands, producing increased flow of saliva, the kidneys, increasing urinary secretion, the stomach, producing the sensation of belching, gaseous eructation and vomiting Reflexes affecting the respiratory center give a sense of suffocation, impending dissolution and imminent death in the more severe Vasomotor affections produce a sense of fainting, collapse, paleness and cold, clammy per-The constant bombardment of the spinal centers by afferent impulses produces a state of hyperirritability there resulting in hyperalgesia of the skin and superficial muscles in the regions affected-"tender spots"

As a reflex and referred phenomenon, pain in the region of the heart may be due to affections of other parts or organs. A working classification of such pain would, therefore, perhaps be of value, and may be put as follows (1) Psychic or neurotic, (2) hysterical, (3) extra-cardiac, and

(4) cardio-vascular

Psychic or Neurotic Precordial Pain —This is seen mainly in women under 50 and in adolescence Its underlying factors are diverse, such as fear, grief, emotional disturbances of any kind, disappointments, and sexual irregularities or ex-Other functional disturbances of the heart usually co-exist exaggerating the pain by added fear A good example of this class is a young woman, 30 years of age, who came to my office complaining of pain in the left anterior chest, palpitation and slight dyspnea on going up three flights of stairs There was nothing in the history and physical findings, confirmed by fluoroscopy and electrocardiography, to indicate cardiac disease Her environmental conditions, however, were of note She was married eight years, had one child who was sick. Her husband likewise was sick and seldom worked. She was compelled to work all day in a small store, barely earning a living Aside from that she was sexually inclined and did not have normal relations for several years It was interesting to learn that her pains were greatest at night when at rest, and physical exertion alleviated rather than accentuated it

This is characteristic of this class of pain, and may be used as a differential point in diagnosis. These patients also have a diversity of other complaints such as pains in other parts of the body, especially in the scapular region, gen-

eral exhaustion, headaches, and abdominal and pelvic complaints. It is hard to tell how much of a rôle focal infection plays in these cases. Many of them probably have some underlying toxic or infectious state. Some of them improve markedly on the removal of infected foci, when found

Hysterical Precordial Pain—This condition may be differentiated from angina by the great frequency of attacks—as many as two hundred a day having been described. Besides, the peculiar and false struggle for air exhibited by vigorous clamoring, constant moving around from place to place, frightful yawning, belching and hiccoughing and other stigmata of hysteria, make its diagnosis easy. It reminds me of a case that I "cured" in two days by giving six sterile needles a day, the pain not recurring for 18 months thereafter

Extra-cardiac Disturbance Giving Precordial Pain—The usual non-cardiac organic disturbances giving precordial pain are diseases of the thoracic wall, diseases of the lungs, pleurae and anterior and posterior mediostinum, and, diseases of the oesophagus and abdominal organs, especially the stomach. In all these conditions the pain is not confined exactly to the precordium, and can be usually traced to its seat of origin by other

signs

Of the commoner thoracic wall diseases giving precordial pain may be mentioned intercostal nerve affections and pleurodynia, leaving out the easily recognizable skin and subcutaneous affections, such as superficial inflammations and Her-Pleurodynia is differentiated from pes Zoster intercostal neuralgia by pain occurring during respiration, and by the presence of tenderness along the affected intercostal muscles Intercostal neuralgia is characterized by pain occurring in paroxysms independent of respiratory excursions, and by the presence of three points of maximum tenderness corresponding to the three branches coming off the intercostal nerve-anterior cutaneous, at the costo-sternal articulation, lateral cutaneous, at the mid-axillary region, and the posterior-primary division, at the vertebral column The intercostal nerve pains due to pressure at their origin, in or outside of the spinal column, by fracture, aneurism of the descending thoracic aorta, primary or secondary new growths, carcinomata of the spinal canal, are characterized by girdle pains, not exactly localized to the precordium

Pleuritic and pneumonic affections giving precordial pain can usually be differentiated by symptoms and signs referable to those organs

Acute and chronic mediostinitis are rare. The pain here is situated behind the sternum associated with a sensation of tightness of the chest. There is marked tenderness in the sternal region, and the pain has a tendency to radiate to the neck and shoulder. In the acute form mediostinal crepitation may be made out. In the chronic form the precordium is involved, and the resulting mediostino-pericarditis is recognized by

Case 54 Mrs M C Age 57 Onset January 5, 1927, operated January 15, 1927 Strangulated right femoral hernia, Richter type, with gangrenous bowel Resection of bowel Closure of ends and lateral anastomosis under spinal anesthesia Death two weeks later from sepsis, following large abscess of buttock and abdominal (Comment)—Case seen ten days after onset of fecal vomiting

Case 55 Mr J B Age 69 Onset February 15, 1927, operated February 15, 1927 Ileum adherent to lower angle of appendiceal wound with marked torsion of the bowel Adhesion divided and bowel emptied upper loop into lower.

under spinal anesthesia Recovery

Case 56 Mr J W Age 66 Onset July 31, 1927, operation August 2, 1927 Diagnosis acute obstruction of a carcinoma of the sigmoid Intense distension of abdomen Cecostomy done under local infiltration, novocaine Later Mickulicz three-stage operation Good recovery

Case 57 Miss E S Age 46 Onset July 23. 1927, operated within six hours Loop of ileum had slid under band from previous appendectomy operation twelve years before, loop of bowel was black, also a second loop which was apparently Bowel resected and end to end anastomosis under ether anesthesia Complicated re-

Case 58 Mrs S M Age 81 Onset June 1 1927, operated June 3, 1927 Acute obstruction of an annular carcinoma of sigmoid Operation under infiltration anesthesia Colostomy done Good recovery from obstruction Condition inoperable as far as carcinoma was concerned

Case 59 Mrs C S Age 74 Onset October 31, 1926, operated October 31, 1927 lated left femoral herma bowel black, mesentery circulation intact, bowel revived under hot packs, closure of herma by Moschovitz method Local anesthesia Recovery

Mrs C McN Age 62 Onset No-Casc 60 vember 23, 1927, operated November 23, 1927 Strangulated right femoral hernia Loop of ileum Richter type, mesentery vessels not thrombosed, bowel revived under hot packs and dropped back Herniotomy by Moschovitz meth-Spinal anesthesia Recovery

Conclusion from detailed study of tabulated cases shows

- 1 Sixty-one per cent of cases occur in females
- 2 Great majority of cases occur in fourth, fifth and sixth decades of life
- 3 Fifty per cent of cases have a record of former operative procedure
- 4 External herma is the cause of thirty-four per cent of the cases of obstruction
- 5 In seventy-eight per cent, the site of pathology is in the lower ileum and pelvis
- 6 In cases operated during first twenty-four hours mortality was sixteen per cent, this including several with mesenteric thrombosis Demonstrates value of early diagnosis
- 7 Mortality in cases requiring resection was fifty per cent Tragic sequence of delayed diagnosis and late operation
 - 8 Mortality in above series 30%

THE INTERPRETATION OF PRECORDIAL PAIN By LOUIS H SIGLER, MD, BROOKLYN, N Y

AIN in the region of the heart with or without areas of radiation requires great care in its interpretations Often it is an indication of organic cardiac disease. At times, however, it signifies other disturbances reacting on the nervous mechanism connected with the heart, giving a rather false perception as to its seat of origin It is of great importance, therefore, to decide where the pain originates and to find its relation to disease of the heart To do this we must have a clear conception of the meaning of pain and its modus operandi

Essentially, pain is a reaction on the part of the organism to harmful stimulation and tends to warn the individual of approaching danger appreciation depends upon the character and intensity of the stimulus and the perceptive power

or sensitiveness of the individual

The localization of pain is best developed in the structures at the surface of the body, for the receptor organs there are directly connected by means of sensory neurons with the central nervous system, and the sensation is carried from

each part to a corresponding pain perception area in the brain The pain perception of the viscera, however, is not thus conveyed, but is carried by the sympathetic afferent neurons which make connections with the sensory neurons of the voluntary nervous system in that segment of the From there spinal cord in which they enter these impulses are carried to the brain. For this reason, irritation occurring in internal organs is felt as pain not exactly in those organs, but is referred to an area on the surface of the body the nerves of which are in synaptic relation in the spinal cord with the sympathetic neurons supplying these organs Referred pain may thus be felt at a great distance from its seat of origin

Associating referred pain there are usually two other classes of reflexes induced by harmful stimuli acting on any viscus The first is the class of reflexes inducing remote organs such as gastro-intestinal, vasomotor, pilomotor and others to become hypo- or hyperactive The second 15 the so-called viscero-motor reflex resulting in the contraction of those muscles at the surface which

discomfort This is true even in coronary thrombosis if a small branch of an artery has been affected

There are certain characteristics that make the differentiation of these cases possible. In coronary spasm the pain is excruciating and is attended with a sensation of impending dissolution, and with a fear that the slightest move will end in death. The sufferer, therefore, sits very steadily, absolutely motionless, holding on to the sides of the bed to prevent the slightest move. The attack is short-lived, and when over it may leave the patient in a weakened but fairly comfortable condition. Nitrites give immediate relief

In aortic disease the attack is likewise excruciating, but instead of sitting still the patient rolls around in severe agony until the attack is over. The pain is retrosternal, and the intervals between attacks are associated with a constant dull ache

in the same region

In coronary occlusion, if a large artery has been involved, death may result instantly. If a smaller branch is affected there is a long-continued, very severe substernal pain, lasting many hours, not relieved by rest or nitrites but only massive doses of morphia may relieve. The pain is sometimes referred to the epigastrium and may be associated with vomiting in which case it is often mistaken for severe indigestion or some acute abdominal disease from which it must be carefully differentiated. The important differential point is more or less cardiac decompensation which must be carefully detected.

In conclusion I must add that although the attempted classification here given fits in with most cases, we must realize that many cases are not as clear-cut as would seem from my description. This is due to the fact that many cases have several physiologico-pathological factors inducing pain in the same individual and would not definitely fit in with any single factor.

- min any smale

Summary

An attempt has been made to classify precordial pain on a clinico-pathological basis as fol-

lows (a) Psychic or neurotic pains with some toxin or focal infection as probable underlying factors, (b) Hysterical pains, (c) Pain due to disease of the extracardiac structures, such as the thoracic wall, pleuræ, lungs, mediostimum, æsophagus and stomach, and, (d) pain due to cardio-The last group may be subvascular disease divided into two classes—the class in which pain occurs on exertion or effort and that in which pain ocurs in explosive outbreaks, effort not being much of a factor Of the first class we have the cases of coronary sclerosis, disease of the first part of the aorta involving the coronary orifices, anæmias, overexertion and the hypertrophied hearts incident to hypertension and valvular dis-In the second class we have cases with coronary spasm, cases with acute aortitis and cases with coronary occlusion, due to embolism or thrombosis Differentiation of the various groups is made

A PLEA FOR CO-OPERATION BETWEEN THE MEDICAL AND DENTAL PRACTITIONER*

By THEODOR BLUM, DDS, MD, NEW YORK, N Y

E are all quite aware of the fact that the co-operation which exists at the present time between physician and dentist and oral surgeon is not what it should be Therefore, I am very glad to have the opportunity to encourage the understanding between these professions if I possibly can

To realize the importance of such co-operation the physician must know what to expect

* Read before the Metropolitan Medical Society, November 22

from the dental practitioner or oral surgeon as a consultant

What constitutes an examination of the mouth? Aside from the actual physical examination of the teeth, jaws and surrounding soft tissues, it includes a complete series of about fourteen intra-oral films of the teeth and surrounding tissues as well as extraoral plates of the maxilla and mandible. The study of these films will also show beginning decay—at times the cause of obscure pain—which

symptoms of adherent pericardium such as marked dyspnea and signs of venous obstruction, as distension of the thoracic veins, ascitis, anasarca and lividity

Pain in oesophageal disease is characterized by being deep-seated, usually referred to the bottom of the sternum, and is evoked by the act of swal-

lowing

Affections of the stomach is a very frequent cause of pain in the precordium, associated at times with palpitation. This pain is usually localized, however, to the bottom of the sternum and epigastrium, and is of a dull boring nature, with a tendency to radiate to the left breast and to the back, behind and between the scapulae. It is relieved by vomiting and gaseous eructation

Precordial Pain Due to Cardiovascular Disease -In speaking of this class of pain we have in mind angina pectoris—a very fascinating term and one subjected to many theories as to cause, since its original description by Heberden¹ in 1768 This writer depicted the attack in a most detailed and perfect manner, leaving nothing to be improved upon to this day He thought it to be due to cardiac contraction In 1772 Janner and in 1788 Perry noted its coincidence with sclerosis and calcification of the coronary arteries In 1812 Warren² described a case of typical angina in which post mortem findings showed pleural and pericardial adhesions, enlarged heart, dilated ascending aorta with "tubercles" and dilated coronaries Since then, numerous other pathologic findings have been described, and some cases have been reported in which there were no anatomic abnormalities found post mortem is noteworthy to add, that many conditions where definite and most severe cardiac pathology exists are not associated with angina Enumerating the findings in the examination of 1500 consecutive heart cases, White found only 188 cases of angina, 48 of which showed no organic disease Baird in an analysis of 100 cases of heart pain found 42 cases associated with heart failure or myocardial weakness, 17 cases of cardiac neurosis, 17 cases of hypertension, 15 cases of the socalled "true" angina pectoris, 7 cases of chronic endocarditis and two cases of aortitis Satterthwaite⁵ considers angina a "dangerous but rare He states that records of 823 cases of his own clinical experience and of 2,300 cases of some of his colleagues, failed to show a single case of true angina pectoris. As no definite distinction is to be drawn between the so-called "true" and "false" anginas—all cases according to Mackenzie being true angina-his statement probably needs correction

In view of these facts it is not surprising that numerous theories have been advanced as to the cause of angina—some highly speculative and fascinating, others more logical. The latter are those of Mackenzie, Vaquez, and Clifford Albutt.

Mackenzie blames the condition on diminished blood supply to the heart muscle incident to coro-

nary disease or obstruction, added to which there is a hypersensitive nervous system. The resulting heart weakness or failure is thus expressed by the nervous system in the form of pain.

Albutt considers the condition to be due to a painful distension of a diseased aorta. This view is held also by Vaquez who adds that in some cases, notably in his so-called "angina pectoris of decubitus," it is due to a sudden distension of the left ventricle incident to a sudden spell of hypertension. He compares it to the pain induced by sudden distension of the bladder as compared to the absence of pain in the gradual distension such as exists in a gradually increasing hypertrophy of

the prostate

It would seem that in view of the occurrence of the condition under various pathologic or even apparently normal states of the heart and aorta, one theory is not sufficient to explain all cases would perhaps be best to classify the condition In one group I would put into two groups those cases where the anginous syndrome occurs on exertion and in the other where it occurs as a sudden explosion, even without exertion first group would comprise those cases in which there is a deficient blood supply to the myocardium or in which the supply is impure or toxic The second group would include the functional angiospastic individuals, the structurally diseased aorta, and coronary thrombosis

The first group would include the cases of coronary sclerosis, diseases of the first part of the aorta at the orifices of the coronaries, occluding those openings, cases incident to anaemia, especially pernicious anaemia as reported by Evans® and by Coombs¹⁰, the overstrained heart due to too much exertion, and, the hypertrophied heart incident to hypertension or chronic valvular disease, in which the coronary supply does not keep pace with the hypertrophy, resulting in partial The cause of pain in all anaemia of the muscle these cases is probably irritation of the nerves of the heart by metabolic toxins produced by muscular contraction, which are not removed quickly enough due to deficient circulation. It may also be due to a greater production of such toxins in the absence of a sufficient amount of oxygen required in the case of increased muscular activity The characteristics of this group are more or less typical anginal pains induced by effort verity of the pain is dependent on the amount of exertion and the limitation in blood supply to the muscle

In the second group may be included cases of coronary spasm, cases of acute aortitis or chronic aortitis with acute exacerbations, and, cases of sudden occlusion of a coronary artery resulting from embolism and thrombosis. The characteristics of this group are that it is the most painful, that it comes on very suddenly and at times without any warning and that in the intervals between attacks, the patient may be free from pain, and can do at times a good day's work without any

While scientific research in dentistry has not accomplished much so far, the dental profession is much ahead of the medical when it comes to periodic health examination and prevention. To refresh your memory I wish to inform you that the dentist has created the profession of dental hygienists, women who at intervals of from three to six months and under a dentist's supervision clean the patients'

teeth — prophylactic treatment — and examine them also for early decay and diseased gums. The dental profession must be highly congratulated for having taken this important step.

In closing, let me again ask you to assist as much as possible in bringing about a better understanding between the medical and dental professions and closer and more friendly cooperation in the interest of our patients

THE SYNDROME OF SPONTANEOUS POLYNEURITIS

By L GRIMBERG, MD, NEW YORK, N Y

THE syndrome described here has been mentioned by various authors under different names Gordon Holmes¹ called it "Acute Infectious Polyneuritis," and Osler in his Practice of Medicine described it as an "Acute

Febrile Polyneuritis"

Clinically, the cases form a group which stands out among all the other polyneuritides The chief characteristics are that we are primarily dealing with a polyneuritis of an ascending type, that the onset of the disease is rather stormy—a sudden onset, rapid course -and the regression of the symptoms is also rapid, followed by a slower and gradual recovery with very few, if any, sequelæ There is no doubt that the disease is an entity by itself possibly of an epidemic nature, and unquestionably of infectious origin. The literature on the subject contains a great many cases, particular attention being paid to cranial nerve involvement. However, a careful scrutiny shows that not all of them could be classed in the group described here Following the trend of today prevailing in neurology, I will describe them under the name of "the spontaneous polyneuritic syndrome"

REPORT OF CASES

1 J R, 40 years of age, laborer, married, was taken suddenly ill with weakness in his legs and difficulty in walking. Two days before onset while at work he was caught in the rain and became thoroughly wet. In the evening he had a chill. For the next two days he felt weak and painful but he was able to get around the house. The third morning after the exposure he was unable to get out of bed. He had pains in his legs and arms and was unable to walk. The paresis of his legs crept up to his arms and by the end of the third day after onset, his arms and legs were paretic and he could not stand up in errect posture.

The examination showed a well nourished man, unable to stand up and walking with

very great difficulty Temperature was 101 F and pulse 100 Blood pressure 180-90 Otherwise the general physical examination was negative Urine negative He denied venereals or alcohol

Neurological examination Gait was difficult on account of a double foot drop foot drop was practically complete on the left side and less pronounced on the right hands showed a wrist drop, more so on the Both arms showed a flaccid paralysis The body was kept bent forwards on account of a weakness of the errector muscles of the The motor power of both, the upper and lower extremities, was greatly diminished The pupils reacted well to light and accommodation and were equal No ocular muscle The right as well as the left side weakness of the face showed immobility, but more accentuated on the left There was no other cranial nerve involvement The affection of the seventh nerve was peripheral No loss of sphinteric control The reflexes of the upper limbs were greatly diminished. The patellar reflex was absent on the left and diminished on the right. The achilles jerk was absent on both sides Sensation in all forms preserved

In the course of the next three days the paralysis of the lower extremities became much better. He was able to walk, his arms became stronger and the power returned. At the end of two weeks, the difficulty in gait completely disappeared, and the only sequelae was a weakness of the left hand. The right face was normal, but the left showed a slight immobility.

The blood count at the beginning of the disease showed 11,000 white cells, otherwise normal. The blood Wassermann was negative. The spinal fluid was normal and the Wassermann was negative.

Conclusions

The history of a man taken suddenly ill with an ascending paralysis affecting the periph-

may not be easily or at all detected by ordinary examination Because the pulp of a tooth may be devitalized without such a condition being recognized by x-ray or other nonoperative means, the electric pulp test of all teeth should be a routine procedure, although actual drilling into the crown of the tooth may have to be resorted to in some instances to finally decide the condition of the pulp

Anyone treating patients for oral surgical lesions must have an intimate knowledge of the anatomy and pathology of this region As long as these subjects are only adequately taught in dental schools the operator should

be a dentist first of all

Let us for example consider the general He is far too radical when operating for osteomyelitis of the jaws Very frequently a number of teeth can be saved and an external incision avoided. In the removal of tumors he overlooks the fact that a dentist will have to restore the masticating apparatus and that conservatism is indicated especially in benign cases Most salivary calculi can be removed through the mouth and the glands left Many cases are erroneously diagnosed as angina ludovici and apparently cured, though they really were dealing with a periostitis or lymphadenitis

The antrum being an accessory sinus of the nose, belongs to the rhinologist Only when of dental or maxillary origin should a diseased maxillary sinus be treated by the oral surgeon provided the nose and other sinuses of the same side are intact. In many instances the rhinologist and oral surgeon will advantageously operate together Frequently Vincent's Angina spreads forward into the mouth, when careful prophylactic treatment of the teeth is very important Erupting third molars especially in the mandible often simulate an attack of tonsilitis and abscesses developing from it

a tonsillar abscess

Harelip and cleft palate although often operated upon by the general surgeon, are more advantageously taken care of by the oral surgeon or the rhinologist. At any rate, the treatment of these cases is a special study and should not be attempted without it

Co-operation with the general roentgenologist for the diagnosis of disease of the sinuses is indispensable. However, a complete series of intraoral films and their interpretation is better left to the dental specialist who has a more intimate knowledge and clinical experience in the oral field The general roentgenologist will rarely be called upon for the localization of foreign bodies or malposed teeth

Regarding oral focal infection I wish to say that its importance is somewhat exaggerated. Of course, most patients coming under my observation usually have had all their devitalized

teeth removed and still continue to complain of their original ailment But although we know little about this subject we must advise sacrificing every devitalized tooth if we want to be certain of having eliminated every possible focus of infection However, devitalized teeth satisfactory from the dental standpoint should be removed only as a last resort and not without having first examined and treated diseased conditions in other parts of the body

On the other hand, reflex nerve pains and nervous conditions are often caused by malposed teeth and cured by their removal is on this account that I believe quite firmly that malposed teeth should be either placed into their normal position or removed. While on this subject I wish to recall to your minds that the cause of trifacial neuralgia is not known and that the best treatment is surgical and consists of the modified operation of cutting the sensory root of the fifth cranial nerve, (fractional section of the sensory root Frazier), while alcohol injections should be used only if contraindications for the surgical procedure are present Even though the removal of roots, infected or impacted teeth does not permanently relieve the patients, such procedure is advisable to be able to give them a clean bill of oral health

The modern physician knows that the examination of a patient is not complete without one of the mouth and teeth The oral diagnostician and consultant who must be familiar with medicine and dentistry is therefore indispensable As a rule, the oral surgeon, preterably the one who is also a medical graduate, fulfills best the requirements of such a consultant, who can also link together the physician and general dental practitioner the future the important dental and oral subjects will be taught in medical schools such a relationship may cease to be important

The physician is very apt to belittle the dentist, who, however, fulfills quite well his branch of the health service. When graduating from his dental school he is better equipped to serve his patients than the medical graduate under similar_circumstances He will naturally feel indignant if you instruct him to remove a number of teeth, because the majority of physicians is not in a position to judge the condi-, tions present Congenial co-operation between the two will be very advantageous to our pa-

Physicians holding important and influential positions in hospitals must study the dental question very thoroughly A dental interne and dental hygienist are important members of a staff and still, how many institutions include them amongst their co-workers? Can a hospital claim to be up to date without having a dentist on the medical board?

THE ANNUAL MEETING

The time of the annual meeting of the Medical Society of the State of New York is fast approaching and the committees have already begun to make their arrangements

The dates are May 21 to 24-Monday to

Thursday—inclusive

The place is Albany and the building is the Armory, which insures abundant room and provision for sociability

The Registration Booth and Commercial Exhibits will occupy the center of the large drill hall. with a large space left for the gatherings of the doctors At one end there will be a room which doctors and exhibitors may use for showing pictures

The assemblage of all the features of the meetings under one roof will enable physicians to gét the greatest benefits with the least effort

eral nerves of the arms and legs and the rapid clearing up of the symptoms with practically no sequelæ It is important to note that the parallysis affected the extensors

2 Q, young man of 33 years of age, single, merchant Two days before onset he was caught in a rain and became chilled and wet the following day he had a chill and a slight rise in temperature. Three days after the exposure he was unable to get out of bed, on account of weakness of both legs. He had slight pains in the calves and in his arms. In the course of the following three days his hands became weak so that he was unable to grasp things strongly. He could not walk

Past history was negative He denied

venereals and alcohol

The examination showed a very well built man walking with great difficulty on account of a double foot drop There was a flaccid paralysis involving the lower and the upper Though the affection was bilaextremities teral, the right side seemed more involved No cranial nerve involvement The pupils were equal and reacted to light and accommodation No ocular muscle paralysis The upper limb reflexes were diminished The patellar reflexes were absent and achilles jerks were absent No loss of sphinters Sensation was normal Blood pressure was 120-70 The blood count showed 9,000 white cells and otherwise normal The spinal fluid was normal Urine negative The blood and the spinal fluid Wassermanns were negative

After one week the gait was improved, the patient being able to walk, the weakness of the hands was not so marked, the right showing a slight wrist drop. After another week the recovery was practically complete with the exception of a weakness of the right hand

Conclusions

The history of a man taken suddenly ill after an exposure to rain, with an ascending paralysis of the peripheral nervous system. The rapid ascent of the affection was followed by a rapid regression and practically a complete recovery. The ethiological factor here is unknown, possibly an infection similar to an influenza.

Discussion

In the two cases described above we are at a loss to know the etiological factors. We can draw the conclusions from our knowledge, and say that the course of the disease is similar

to the usual influenzal infections. However, we are unable to group the cases among the influenzal cases, because we are entirely unable to demonstrate it. We are also unable to call them post-influenzal cases. As a matter of fact, the conditions described are not "post" to any disease, but they seem to be independent and primary. It seems to be a disease entity by itself spontaneous and with features which make it characteristic and worth while to be considered. The features which single this condition out from any other polyneuritis, are few but very important.

1- Sudden onset with a flaccid paralysis of the lower extremities The affection is limited

to the peripheral nerves

2 The ascending character—and this is also limited to the peripheral nerves. It is peripheral not only by the fact that the distribution of the paralysis did not follow the segmental type, but also that it affected the most distal parts of the peripheral nerves (Distal from the point of origin). The paralysis is practically limited to the extensors of the lower and upper extremities giving it more the appearance of polyneuritis.

3 In the course of a few days the disease reached its height and the regression of the symptoms started in the parts which were first

affected

4 The affection was bilateral

Similar cases have been described by others However, among the cases described we find a great number which do not enter into our group. I believe that many cases described as Landry's were in reality cases of acute polyneuritis. I would especially call attention to the few cases of Landry's which recovered. The disease described here is more frequent than suspected and that it may appear as Gordon Holmes thought in epidemic form. The rapid course and the fairly rapid recovery makes it so that many cases are overlooked.

To my mind we are dealing in such conditions with a disease limited to the peripheral nervous system, a typical polyneuritis, but acute and spontaneous, rarely fatal, ascending in character and with a tendency to rapid recovery. It can best be described as a "Syndrome of Spontaneous Polyneuritis" 2

1 Gordon Holmes in Osler and McCrae Modern Medicine, vol v, 1915, p 590

2 Case 1 was studied at the Bronx Hospital and Case 2 at the New York Neurological Institute.

the preventive aspects of disease the students would acquire the same attitude, and would place a proper value on the instruction in the department of public health. Almost the only change in the teaching that is needed is that every professor shall consciously emphasize the prevention of the disease that is being considered. If this instruction is given, there will soon be no ground for the assertion that young doctors are not likely to practive preventive medicine until they have come under the influence of the medical societies and have heard the complaints of the people that the doctors cannot keep diseases from developing

The medical school also has a responsibility for the student's outlook over the medical field, and his point of view regarding ethics, civic medicine and his duties generally toward his fellow practitioners and the public Since the physicans have a monopoly of the practice of medicine, they must be ready to give any form of medical attention that any individual or community requires Much of that service must be done by medical societies, especially those of the county and State. The average graduate from a medical school has little conception of the concrete work of the county medical society in speaking in the name of that abstraction called "The Medical Profession" Every practitioner of medicine is a member of the medical profession, and should also be a member of the county medical society would probably seek admission at the first opportunity if its importance and value had been impressed upon him during his student career But here again the teaching is not so much by means of formal lectures, as by the example of the instructors and their references to the activities of the County Societies

When the recent graduate enters upon his hospital interneship, he is subjected to disillusions regarding the infallibility of the diagnoses taught in the medical school, and at the same time he receives revelations of the trustful attitude of patients towards their physicians. He learns that a patient is a human being who judges the doctor by his manners quite as much as by his science. He discovers that discreet promises and assurances have a high therapeutic value and yield good returns in the gratitude of the patient. He learns human nature as well as sickness.

The young doctor entering private practice is Shall he adhere confronted with a dilemma strictly to the scientific medicine of the medical school or shall he yield to commercialism of whose possibilities he caught a glimpse in the hospital? The medical society will help him to de-If the medical society has been brought to his attention in the medical school and hospital, he will apply for admission to it, and will find that its members are constantly seking more light in scientific medicine, and are trying to meet the medical needs of the community The medical society will be his medical school and fraternity, and his guide and inspiration in the discharge of his civic duties to the community

Medical societies have a degree of responsibility for the courses of instruction in the medical school. The practicing physicians know the needs of their communities, and they expect the school to prepare students to fill those needs. Conferences of representatives of medical societies with the Deans of the medical schools will be of mutual benefit to the schools, the medical profession and the public

THIS JOURNAL TWENTY YEARS AGO

County Laboratories - The first county laboratory in New York State was that of Ontario County which was opened October 1, 1906 establishment of this laboratory is described in the Tebruary, 1908, issue of this Journal in an article by Dr O J Hallenbeck of Canandaigua, N Y, as the result of an epidemic of diphtheria in the winter of 1905-6, in the Ontario County Orphan Asylum The matter was first taken up by the physicians in January, 1906, in a meeting of the County Society, which appointed a committee to consult the Board of Supervisors, and to conduct a campaign educating the people principally through the press, Mrs Mary C Thompson, of Canandaigua, offered to build and equip a laboratory if the county would support and operate it at a cost estimated at fifteen hundred The Medical Society at once secured the passage of a law by the Legislature authorizing the Board of Supervisors to support the proposed laboratory and establishing rules for its operation. Furthermore, the health officers of the county formed an Association and took an active part in promoting the laboratory.

Dr Hallenbeck describes the work of the laboratory as follows

"The cost of the building was approximately \$1,000 and the cost of the equipment about \$400 Our laboratory was opened October 1, 1906, with Dr H I Davenport as bacteriologist, a graduate of Johns Hopkins University

"Our expenditures for the fifteen months ending January 1, 1908, were \$11191, and our receipts were \$163, leaving a balance with the County Treasurer in our favor \$5191"

The seed was small, but it was nurtured by Dr O J Hallenbeck himself, who was one of the most active and progressive health officers of New York State

THE MEDICAL SCHOOL AND THE MEDICAL SOCIETY

Three organizations enter successively upon the training of a physician

1 The medical school,

2 The hospital,

3 The medical society

The three organizations form an inseparable trinity whose unity is becoming more and more evident The inclusion of the County Medical Society in the trinity has been recognized only recently, but it is now a powerful factor in the training of physicians The education of the practicing physican never ends, but if he does not continue to study the subjects of his under-graduate course—even the basic sciences of his first year he falls behind the times within five years after his graduation Moreover, the doctor is often confronted with problems of a social and civic nature involving phases of the practice of medicine which are the peculiar fields of organizations whose functions are of an official, or political, or legal nature The County Medical Society continues the work of the medical school in educating the physicians in scientific medicine, and in addition, it is the teacher and leader of the physicians in the medical civics of the County

The Medical Society is the medical school of the practicing physicians of the County, and it can have a valuable influence on students from the time that they begin the study of medicine ideal condition will be realized when there is a close fellowship between the Medical School and the Medical Society of the County and State While the medical school, the hospital, and the medical society each has its peculiar responsibility in training physicians, yet each can be of essential help to the other The responsibility for training the physician has fallen on the medical schools primarily, with the assistance of the hospitals in recent years, but with comparatively litle help from the medical societies However, the leaders among practicing physicians are now planning the discharge of all their duties, including the training of physicians from the outset of their student careers A concrete evidence of that interest is the recent conference of the representatives of the Medical Society of the State of New York with the Deans of the Medical Schools of the State (see p 220)

Who shall be our future physicians is determined almost solely by the medical schools. This is a grave responsibility in which the practicing physicians can be of great assistance. The medical schools now accept only about one in five of the applicants for admission, and the principal standard by which they measure the desirability of an applicant is his proficiency in scientific studies in the undergraduate college. But there are also to be considered the temperament and character of the applicant, and these qualities can be judged best by physicians who know him Something of the old preceptorial system is

needed in order that the personality of a candidate may be judged and certified by practicing physicians. The ideal physician has a combination of altruism and business acumen, of science and common-sense, and of formality and sociability. These are the qualities which revealed themselves daily to the old fashioned preceptor, and which the medical schools could now ascertain from physicians who know the candidate.

The medical school has a responsibility to emphasize the prevention of diseases. Its peculiar work is to give its students instruction in human sickness-its nature, recognition, treatment, causes, and prevention Nine-tenths of the instruction has been, and probably always will be, on the subject of clinical medicine, by which is meant the study of diseases in a stage in which they are crippling or disabling to the patient But modern standards of medical practice require that a doctor shall diagnose a disease in its incipient stage, and even to recognize a real threat of dis-The attempts to meet these requirements have led to the serious suggestion that two medical courses be given, one in clinical medicine leading to the degree of Doctor of Medicine as at present, and another in preventive medicine and public health leading to the degree of Doctor of Public Health But happily this artificial distinction has been avoided Physicians now recognize their duty to practice public health and preventive medicine, and medical schools give instruction in both subjects

The teaching of the subjects of public health, preventive medicine, preclinical medicine, and periodic examinations is sometimes assigned to a department of public health. When this is done, the students are likely to acquire three misapprehensions

1 That the subjects will have no value to them in their hospital interneship, and little in their private practice

2 If the subjects were important, they would be taught in the departments of medicine, surgery, and pediatrics, and by men who know the subjects better than the professors of public health

3 Many of the teachers in the department of public health have no medical degree, and so they cannot teach medical students

The situation in most medical schools is one of mental attitude toward the subjects rather than of opposition or indifference. The time to teach the prevention of any disease—rheumatism, for example—is while the entire topic is under consideration. The professor of clinical medicine will make a deep impression on every student if he says a few words on the early recognition and prevention of the disease under discussion, and also refers to what the instructor in the department of public health will say about the disease. If all the professors gave the proper emphasis to

mus, for after thymectomy in animals we see a very similar picture, comprising hydrolability, acidotic-toxic exsiccosis, etc. This picture varies with the state of the thymus, for if this is hyperplastic we see water retention and if atrophic water impoverishment (exsiccosis). In the child whose case is quoted above, the first attack of vomiting supervened in 6 hours after beginning the diet — Klimsche Wochenschrift, December 3, 1927

Atypical Sprue -Alfred C Reed and J E Ash, writing in the Archives of Internal Medicine, December 15, 1927, lx, 6, call attention to the fact that the diagnosis of sprue based on the characteristic diarrhea, stomatitis, and afebrile course is comparatively easy, but it does not include many early cases which may later prove to be sprue They describe eight atypical cases in which the gastroenteric disturbances were like those of sprue In seven there was a definite achlorhydria, with the digestive disturbances incident to this condition, there was a history of a previous intestinal phase of sporadic diarrhea of from several months' to several years' duration As a rule the intestinal phase had disappeared when the patients came under observation, and the condition was being handled as anemia thors conclude that there is a definite clinical entity, combining gastroenteric disturbances like those of sprue, an anemia approaching the so-called pernicious primary type, and nervous phenomena characteristic of subacute myelinic degeneration of the spinal cord and peripheral Any of these groups may be found associated This variety of atypical sprue occurs chiefly in white men resident for varying periods in tropical or subtropical climates This fact may account for the predominance of gastroenteric symptoms, in which it differs from Addisonian anemia. It is progressive and, although remissions occur, the course usually proceeds to a fatal termination is assumed that these borderline or composite cases with polysystemic damage are the result of a single type of toxin of gastroenteric origin, it seems reasonable to suppose that classical sprue, Addisonian anemia, and myelinic degeneration may have a similar etiology, and at times develop into this pleomorphic picture

Celiac Disease (Chronic Intestinal Indigestion)—Louis W Sauer, writing in the American Journal of Diseases of Children, December, 1927, NXIV, 6, points out that the three-phased, high protein diet (omitting fresh cow's milk, carbohydrates, and fats) when rigidly enforced is usually curative in celiac disease within from one to two years. This is suggestive of the etiology of the affection. Noxious intestinal products, probably formed by bacterial action.

on carbohydrates and fats, play an important role in the etiology The disease has never been produced experimentally, but circumstancial evidence leads to the hypothesis that it nught be transmitted from one child to another Prognosis depends on the diet rather than on the severity or duration of the disease Sauer discusses a series of 25 patients, in the majority of which a standard three-phased, high-protein diet gave rapid and permanent results The first phase of this diet consists in the use of protein milk alone, diluted with Ringer's solution, until the stools are firm, the distention slight, the gas not excessive, and the appetite good It is advisable to begin with several level tablespoonfuls of powdered protein milk less than the number of pounds the When this is well taken, the child weighs number of tablespoonfuls should be increased by two until the number approximates that of the pounds in the child's best previous weight. The second phase then begins Ringer's solution may be discontinued, and small quantities of curd without whey, lean beef juice, cottage cheese, scraped beef, and egg may be added Powdered skimmed milk may be substituted for protein milk Cod-liver oil, orange juice, and iron should also be given in increasing quantities The duration of this stage may be many months, it may be years. The third stage consists in the addition of carbohydrates, increased in amount slowly and cautiously. It is better not to allow bread, potato, sugar, icecream, candy, cake, and fresh milk until the end of the second year of treatment event of an exacerbation of the disease the first-phase diet should be resumed without delay

Ehrlich's Chemotherapy —In a discourse on certain general principles which require to be brought into application in all treatment of bacterial disease, Sir Almroth E (Lancet, December 24, 1927, ccxiii, 5443) shows that Ehrlich's terminology is inadequate and in many respects erroneous. A grave blot on Ehrlich's wonderful work was that he failed to realize why his therapia magna sterilisans in syphilis had failed The reason is that while some of the infective microbes are circulating in the blood others lie in regions so physiologically remote that in the case of arsenic no trace of the agent would ever penetrate them Microbes may become lodged in nonbacteriotropic or, as Wright calls them ecphylactic niduses. The formation of these niduses is dependent upon the arrest of the blood stream and closing down of the capillaries, with the result that the blood supply in the vicinity is rapidly depleted of its bactericidal potency From these ecphylactic foci the microbes gain access to the lymph or secretory fluids Under

MEDICAL PROGRESS

Cardiospasm —After a general review of the subject of cardiospasm, Crossan Clark (Canadian Medical Association Journal, December, 1927, xvii, 12) states that, while temporary relief may be afforded in a few cases by the use of atropine, the best results have been achieved by the use of the hydrostatic dilator Metal sounds do not dilate sufficiently to afford any permanent relief The hydrostatic dilator is guided into the stomach on a previously swallowed silk thread. It is distended and pulled back forcibly against the cardia The water pressure is then reduced and the proximal end is allowed to slip back into the esophagus The water pressure is now renewed and the cardia dilated, the pressure being maintained for from two to five minutes In cases in which the esophagus is not widely dilated, 16 to 22 feet of water should be the pressure used If dilatation is more marked, 24 to 28 feet can be used with safety As dilatation is usually painful a local anesthetic is generally employed As complications of dilatation fatal rupture of the cardia has occurred, also moderate hemorrhage from the esophagus, and an attack of pleurisy with effusion Roentgenological examination after dilatation usually demonstrates no obstruction at the cardia series of 299 cases treated by dilatation Plummer and Vinson obtained 76 per cent of com-Clark reports the case of a girl, plete cures aged 5 years, who had vomited every meal for six months Ten dilatations during a period of two and a half months effected a complete cure, with a steady gain in weight from 311/2 to 37 pounds

Pathogeny of Peptic Ulcer-Professor E von Redwitz discusses this thankless subject, where the existence of so large a number and variety of possible causal factors tends to confuse the student and at the same time convince him of the hopelessness of the task. He discusses each alleged causal element in turn and combines them in a diagram which tends to show that the stages of the process are circulatory disturbance, necrosis, acute ulcer, and Each of these stages has its chronic ulcer special causal factors and varieties based there-The diagram shows incidentally that mere causes and effects cannot be predicated of this highly complex condition, which in the number and variety of causal elements and reciprocal interaction of the same resembles another highly complex condition-rickets What we have to do in such an affection is to isolate the

dominating factor or factors and direct our therapeutic resources against them, but this is much more easily said than done Under the circumstances it is best to adhere to old and tried measures while at the same time making every effort to improve our technique. This will lead to the individualization of the treatment and the abandonment of a schematic plan of therapy The distinction between medical and surgical cases is based chiefly on gross pathological alterations, especially stenosis, or alarming complications like hemorrhage and perforation Ulcer in the young has a way of recurring over and over and often no plan of either medical or surgical treatment can be depended on to prevent or cure This behavior, which is naturally restricted to the peptic gland area, suggests that there is a special ulcer constitution or ulcer disease of which the actual lesions are mere secondary expres-At the other extreme we find cases in which there are no causal factors in evidence, the subjects being in excellent health, and this too suggests the existence of a deep seated endogenous affection - Münchener medizmische Wochenschrift, December 9, 1927

Diet and Acidosis -H Seckel sums up the histories of two cases of acidotic vomiting in children as follows A boy who had made a recovery from severe acidotic vomiting was fed on a ketogenic diet with the result that in a few hours he suffered a new attack of vomiting with water impoverishment, blood and urine acidosis, tachycardia, and collapse A healthy -control child was fed on the same diet, which involves withdrawal of the carbohydrates, yet did not develop acidosis nor any other manifestations this experimental case the symptoms could hardly have been due to the losses sustained by vomiting and the latter was doubtless only one of the symptoms induced by a basic anomaly of meta-The initial manifestations on the diet are loss of weight and ketonuria The control child showed these two effects of the diet (although, as stated, there were no clinical symptoms apparent) but they supervened at a later The author regards the predisposition to acidotic vomiting as bound up in a constitutional hydrolability which may lead to water impoverishment manifested incidentally by both acidosis The nurshing reacts by an intoxiand toxemia cation, the older child by acidotic vomiting. Insulm cannot benefit this condition unless the diet is first changed There is reason to believe that there is underfunction or dysfunction of the thymus, for after thymectomy in animals we see a very similar picture, comprising hydrolability, acidotic-toxic exsiccosis, etc. This picture varies with the state of the thymus, for if this is hyperplastic we see water retention and if atrophic water impoverishment (exsiccosis). In the child whose case is quoted above, the first attack of vomiting supervened in 6 hours after beginning the diet — Klimische Wochenschrift, December 3, 1927

Atypical Sprue -Alfred C Reed and J E Ash, writing in the Archives of Internal Medicine, December 15, 1927, lx, 6, call attention to the fact that the diagnosis of sprue based on the characteristic diarrhea, stomatitis, and afebrile course is comparatively easy, but it does not include many early cases which may later prove to be sprue They describe eight atypical cases in which the gastroenteric disturbances were like those of sprue In seven there was a definite achlorhydria, with the digestive disturbances incident to this condition, there was a history of a previous intestinal phase of sporadic diarrhea of from several months' to several years' duration As a rule the intestinal phase had disappeared when the patients came under observation, and the condition was being handled as anemia thors conclude that there is a definite clinical entity, combining gastroenteric disturbances like those of sprue, an anemia approaching the so-called pernicious primary type, and nervous phenomena characteristic of subacute myelinic degeneration of the spinal cord and peripheral Any of these groups may be found This variety of atypical sprue ocassociated curs chiefly in white men resident for varying periods in tropical or subtropical climates This fact may account for the predominance of gastroenteric symptoms, in which it differs from Addisonian anemia It is progressive and, although remissions occur, the course usually proceeds to a fatal termination is assumed that these borderline or composite cases with polysystemic damage are the result of a single type of toxin of gastroenteric origin, it seems reasonable to suppose that classical sprue, Addisonian anemia, and myelinic degeneration may have a similar etiology, and at times develop into this pleomorphic picture.

Celiac Disease (Chronic Intestinal Indigestion)—Louis W Sauer, writing in the American Journal of Diseases of Children, December, 1927, xxxiv, 6, points out that the three-phased, high protein diet (omitting fresh cow's milk, carbohy drates, and fats) when rigidly enforced is usually curative in celiac disease within from one to two years. This is suggestive of the etiology of the affection. Noxious intestinal products, probably formed by bacterial action.

on carbohydrates and fats, play an important The disease has never role in the etiology been produced experimentally, but circumstancial evidence leads to the hypothesis that it nught be transmitted from one child to an-Prognosis depends on the diet rather than on the severity or duration of the disease Sauer discusses a series of 25 patients, in the majority of which a standard three-phased, high-protein diet gave rapid and permanent The first phase of this diet consists in the use of protein milk alone, diluted with Ringer's solution, until the stools are firm, the distention slight, the gas not excessive, and the appetite good It is advisable to begin with several level tablespoonfuls of powdered protein milk less than the number of pounds the When this is well taken, the child weighs number of tablespoonfuls should be increased by two until the number approximates that of the pounds in the child's best previous weight The second phase then begins Ringer's solution may be discontinued, and small quantities of curd without whey, lean beef juice, cottage cheese, scraped beef, and egg may be added Powdered skimmed milk may be substituted for protein milk Cod-liver oil, orange juice, and iron should also be given in increasing The duration of this stage may be many months, it may be years. The third stage consists in the addition of carbohydrates, increased in amount slowly and cautiously is better not to allow bread, potato, sugar, icecream, candy, cake, and fresh milk until the end of the second year of treatment event of an exacerbation of the disease the first-phase diet should be resumed without

Ehrlich's Chemotherapy —In a discourse on certain general principles which require to be brought into application in all treatment of bacterial disease, Sir Almroth E (Lancet, December 24, 1927, ccxiii, 5443) shows that Ehrlich's terminology is inadequate and in many respects erroneous. A grave blot on Ehrlich's wonderful work was that he failed to realize why his therapia magna sterilisans in syphilis had failed The reason is that while some of the infective microbes are circulating in the blood others lie in regions so physiologically remote that in the case of arsenic no trace of the agent would ever penetrate them Microbes may become lodged in nonbacteriotropic or, as Wright calls them ecphylactic niduses. The formation of these niduses is dependent upon the arrest of the blood stream and closing down of the capillaries, with the result that the blood supply in the vicinity is rapidly depleted of its bactericidal potency From these ecphylactic foci the microbes gain access to the lymph or secretory fluids Under

these circumstances the cataphylactic procedures which may be employed are both lymphocytagogic and seragogic Many years ago Wright showed that urticaria, chilblains, physiological albuminuria, and anasarca could all be brought under the general heading of serous "hemorrhage" (excessive serous effusion) which is correlated with diminished blood coagulability and is aggravated by the exhibition of citric acid and other agents which diminish coagulability Manifestly there will be a better prospect of bringing a drug into operation in the tissues if the blood, at the time the drug is introduced, is in a state to furnish a maximum of serous exudate fact that in syphilitic infection the unsound procedure, which Ehrlich called therapia sterilisans fractionata, is sometimes effective clinically may be explained on the theory that where many doses are administered there will be a prospect of the drug being carried in turn to all foci which are accessible Furthermore, salvarsan in repeated doses lowers blood coagulability and this promotes a freer flow of arsenic-carrying lymph through the tissues It might, however, be more rational to begin the treatment of syphilis by administering citric acid in quantity sufficient to diminish blood coagulability and increase serous effusion all over the body As much might then be accomplished by the first dose of salvarsan as is accomplished by the ordinary procedure after a long series of doses Since the products of Arthusian inflammation are much more effective than those supplied by ordinary inflammation, this method might be found to be applicable to infections of the central nervous system, not only syphilitic but such as encephalitis lethargica, infantile paralysis, and rabies A mixture of serum and antiserum, or possibly an antihuman precipitating serum by itself, could be injected into infected tissue or a neoplasm, or into an infected serous effusion or secretory fluid In addition, hypertonic salt solutions injected into the blood may have a useful cataphylactic application. They will then function as powerful seragogues and, where the blood contains chemotherapeutic agents, will carry these in a rapid stream through the tissues and into the foci of infection, accomplishing results even more rapidly than reduction of the coagulability of the blood

Prophylaxis of Tetanus—S Heilbronn refers to a paper by Krecke published last summer in the Wochenschrift in which it was counselled to inject preventive serum immediately upon the receipt of an open wound This was the lesson of the war, but already a new generation of practitioners has come to the front to whom the war means nothing

They have never seen a case of tetanus and think it right if only one in a hundred wounded develop this disease to take the chance. The hundredth one then develops the disease like lightning from a clear sky Nothing can be done and yet it would have been so easy to prevent it A case in point concerned a little girl of 7 years who eight days before had hurt herself on a sharp stone The wound healed kindly, without treatment, although a practitioner was called in as a matter of form. A slight break in the sole of the foot was seen, barely 2 cm long without the least sign of inflammatory reaction The child was in the best condition There was time to inject 20 units of serum but Krecke's advice had not been heeded The practitioner pronounced the child well after a second inspection two days later, but in another 48 hours he was summoned anew, for there were present dysphagia, stiff neck, and trismus, though as yet no general convulsions The child was sent at once to the hospital but died on the following day amid very severe convulsions author's contention is that 8 days had elapsed between the date of the injury and the preventive injection—a much too long interval, for the only safety lies in immediate application of the remedy But it must be confessed that Professor Krecke's advice would be difficult to carry out in civil practice -Munchener medizinische Wochenschrift, December 2, 1927

Gas Gangrene Following Motor Accidents -W F Marshall (British Medical Journal, December 24, 1927, 11, 3494) reports the case of a youth, aged 19, who was the victim of a motor accident, sustaining a severe injury involving exposure of the tibialis anticus which The skin was also torn from was lacerated the left ankle, exposing the extensor tendons Both wounds were ingrained with road dirt In spite of thorough surgical treatment gas gangrene developed and was demonstrated by Recovery folbacteriological examination lowed treatment by antigas-gangrene serum and Carrel-Dakin irrigation of the wounds The best hope in dealing with this condition depends on three main points (1) Early diagnosis is essential, (2) it is necessary to excise all contaminated tissue regardless of the amount of mutilation caused, (3) the condition is controllable by energetic use of antitoxic serum, either the polyvalent variety or the specific antiserum indicated by the bacteriological examination

A similar case is described by Edward C Ellis in the same issue of the Journal In this case the head of the fibula was torn away from its articulation, the posterior tibial vein was torn, and other injuries in this region were inflicted Within eighteen hours after the

accident gas gangrene developed Bacterial examination of a piece of vein and tissue showed B welchn, B multifermentans, Streptococcus facalis, and B coli Examination of the bloodstained and nonstained portions of the farm trousers, which the patient was wearing at the time of the accident, showed the presence of the above mentioned microorganisms patient was successfully treated by thorough excision of the infected tissue and Carrel-Dakin irrigation, but without the use of antigas-gangrene serum, a prophylactic injection of antitetanus serum only was administered Ellis emphasizes the advisability of treating all punctured and contused wounds occurring in street accidents and agricultural districts by open irrigation

Rathogeny of Death by Submersion —Drs E Martin and Costedoat of Lyons write in extenso on this subject. The conclusions in briefest form are to the effect that there are two modes of submersion-death in the accidentally and suicidally submerged One of these is sim-. ple syncope while the other results from penetration of water into the lungs. As a consequence the cadavers upon removal from the body of water present different aspects and may be distinguished as the "white" and the "blue" drowned Both in theory and in fact it is the former which hold out the best prospect for resuscitation, for the blues develop alveolar lesions which often resist all artificial aid such cases venesection is a useful addition to artificial respiration Syncope in these cases seems to be visualizable as a conservative effort. for even after 40 minutes of submersion and hours of resuscitation efforts it is possible to reanimate by persistency in artificial respiration and rhythmic traction of the tongue. At the other extreme, a blue subject who has been under water but a few minutes may have forfeited his life If reanimation is at once successful the lesions which develop later may not be fatal provided treatment is at once instituted the first step is venesection to be followed by the same maneuvers as already mentioned for the white subject, save that artificial respiration is best applied in the prone position when a body is first taken from the water, if for any reason the immediate diagnosis between white and blue is impossible, the patient must receive the benefit of the doubt by being bled -Journal de medecine de Lyon, November, 1927

Prevention of Abortion Trauma —Professor Winter of Königsberg sums up a serial article on abortion trauma by laying down the following precepts on prevention. Naturally, the abortion should be allowed to pursue its course as far as possible in a spontaneous manner. Such advice is not popular with the profession for

it involves much time. In fact so true is this that nearly all practitioners have substituted for the conservative course active radical intervention, which gets prompt results but invites infection, retention, and actual trauma The second precept is that manual is preferred before instrumental intervention, because the finger rarely traumatizes and at the same time is technically superior to instruments in detachment of the The third precept is to employ instruments only for special indications—the sound only when necessary to fix the direction of the cervical canal and to locate the internal os, laminaria tents, only in the first three or four months of pregnancy or in retention with closed cervix, the curette, for removing the very youngest ova (up to three weeks after missed menstruation), and so on Fourth, the cervix must be open enough to admit the finger and incidentally the wide curette and abortion forceps great danger in trying to pass instruments through an insufficiently dilated cervix. In general, the greater the degree of preparation the better the outcome Further before any therapeutic abortion is undertaken the woman must be examined under narcosis in order to ascertain the actual condition of the internal genitals When abortion is not under way spontaneously —that is in all cases of artificial abortion—it is allowable to resort to Hegar's dilators until the cervir can admit the finger -Deutsche medisinische Wochenschrift, November 18 1927

Lead in the Treatment of Cancer -P Duhail, after giving a digest of the Blair Bell lead treatment of cancer based on articles by Bell and others, says that Girard in experimenting with implanted rat tumors has made the discovery that the first action of the metal seems to be to stimulate the tumor growth, but later the latter disappears completely In this experimental work the lead is made to reach the tumor cells not by injection but by electrical endosmosis By the injection method, as used in human subjects, the formation of capillary thromboses appears to cooperate with the toxic action of the lead on the cancer cell Somewhat disconcerting is the fact that a dosage of lead which will modify the growth of the tumor may be the very dose which will cause the patient's death. This is shown in a well known case in which an inoperable cancer the size of the fist melted away under the influence of eight injections of lead, until it was no larger than a filbert But unfortunately, the cumulative action of the ninth dose led to the death of the patient from saturnine intoxication Autopsy showed a lead retention of 01 gram Blair Bell now insists, among other regulations in controlling the treatment by taking the blood counts after each injection and at the same time in measuring the blood urea -Lc Progres Medical, November 19, 1927

LEGAL

By LLOYD PAUL STRYKER, Esq Counsel, Medical Society of the State of New York

LAW, ITS ORIGIN, GROWTH AND FUNCTION

This is the first of a series of twelve editorials which we promised in our issue of January 15th, 1928. The subject, as its title indicates, is a large one, possibly too large a one to be dealt with in the compass of one editorial. All that can therefore here be hoped for is some outline of the theme. The title of this editorial is adopted from that given by the late James C. Carter to a course of lectures prepared for delivery by him before the Harvard Law School more than twenty years ago. Our views upon this subject have been largely influenced by this unusually erudite and well-known book.

The complexity of the subject is indicated at the very outset by the difficulty in finding a comprehensive, all-embracing and thoroughly reliable definition of the term law "No tolerably prepared candidate in an English or American law school," wrote Sir Frederick Pollock, "will hesitate to define an estate in fee simple, on the other hand, the greater a lawyer's opportunities of knowledge have been, and the more time he has given to the study of legal principles, the greater will be his hesitation in face of the apparently simple question, What is Law?"

The definitions of this term have been numerous, and none perhaps entirely satisfactory. That with which lawyers are best acquainted is the one given by Sir William Blackstone in his Commentaries where he defines law as "a rule of civil conduct prescribed by the supreme power in a State commanding what is right and prohibiting what is wrong"

John Austin has defined it thus "Every positive law, or every law simply and strictly so called, is set by a sovereign person, or a sovereign body of persons, to a member or members of the independent political society wherein that person or body is sovereign or supreme"

Mr Carter criticizes the definitions both of Blackstone and of Austin in that neither of them informs us "where we are to find the 'right' and the 'wrong' which the law enjoins or prohibits, except in the injunction or prohibition itself."

Demosthenes defined law as that "to which all men should yield obedience for many reasons, and especially because every law is a discovery and gift of God, and at the same time a decision of wise men, and a righting of transgressions, both voluntary and involuntary, and the common covenant of a State, in accordance with which it beseems all men in the State to lead their lives"

Xenophon's definition is shorter and clearer "Whatsoever the ruling part of the State, after deliberating as to what ought to be done, shall enact, is called a law"

The English philosopher Hobbes defined law as "The speech of him who by right commands something to be done or omitted"

The German jurist Dernberg defined it as "That ordering of the relations of life which is upheld by the general will"

Private law, as distinguished from the law of nations, has been defined by our own Chancellor Kent as "a rule of civil conduct prescribed by the supreme power of a state."

The definitions of this apparently simple term could be multiplied without number. We shall content ourselves with three more from Bouvier's Law Dictionary, where law is defined as

"A rule or method of action, or order of sequences

"The rules and methods by which society compels or restrains the action of its members

"The aggregate of those rules and principles of conduct which the governing power of a community recognizes as those which it will enforce or sanction, and according to which it will regulate, limit, or protect the conduct of its members"

The aggregate of those rules and principles of conduct which the governing power of a state recognizes as those which it will enforce or sanction, in our system of government may be classified under three heads

(a) Constitutional law,

(b) Statutory law, and
(c) Common law, which consists of the great body of judicial decisions by the Courts, both of England and of the United States

The people of this State have the right from time to time to change or modify their constitution in any way they choose, subject only to the limitation that they may not so amend it as to conflict with the constitution of the United States The legislature has the power and the right to enact any law which it chooses, provided that it does not conflict with the constitution of the State or of the United States The judges do not make or enact laws, their function is to ascertain what the law is, and after they have determined this question, then to construe that law, and apply it as a rule of conduct for the determination of the

particular dispute that is brought before them

One of the questions which judges frequently are called upon to decide is whether a law, which has been passed by the legislature, is in conflict with the constitution either of the State or of the United States If the Courts decide that a statute, although duly passed, in fact conflicts with some provision of either of the two constitutions mentioned, the Court has both the right and the duty to declare that law "unconstitutional,"—that is, contrary to the constitution, and therefore void Any law duly enacted by the legislature, and not in conflict with either of the constitutions mentioned, is a valid law, that is to say, it is a rule "by which society compels or restrains the action of its members"

But this subject should be considered in a larger aspect than that involved in the mere question of constitutionality. The fact that a legislative enactment has been passed, and that it does not contravene either of the constitutions, does not assure or guarantee that it will be either respected or obeyed as law. It is law, and it should be obeyed by reason of the mere fact that it is the law, but the experience of manking reveals that whether or not it will ultimately be obeyed depends upon the law itself, that is to say, upon its wisdom, justifica-

tion and fundamental justice.

"There are," says Mr Carter, "a vast number of laws on the statute-books of the several States which are never enforced, and generally for the reason that they are unacceptable to the people There are great numbers of others the enforcement of which, or attempts to enforce which, are productive of bribery, perjury, subornation of perjury, animosity and hate among citizens, useless expenditure, and many other public evils All these are fruits of the common notion, to correct which but little effort is anywhere made, that a legislative enactment is necessarily a law, and will certainly bring about, or help to bring about, the good intended by it, whereas such an enactment, when never enforced does not deserve the name of law at all, and when the attempted enforcement of it is productive of the mischiefs abovementioned, it is not so much law as it is tyranny Among the evils which oppress society, there are few greater than that caused by legislative expedients undertaken in ignorance of what the true nature and function of law are, and the effective remedy-at least there is no other—lies in an effort to correct -this ignorance by knowledge?

At another point in his admirable book, Mr Carter writes "The Written Law is victorious upon paper and powerless elsewhere" And then he goes on to point out that the prosecuting officer "is sensible of the feebleness of the command resting upon him to enforce a law

the enforcement of which would send a hundred of the most eminent citizens to jail and throw the industry of the country into confusion. Meanwhile, the interests of peace and order are left to the protection of the nominal criminals! The command of the Sovereign will prove impotent against the unyielding force of custom.

"The popular estimate of the possibilities for good which may be realised through the enactment of law is, in my opinion, greatly exaggerated. Nothing is more attractive to the benevolent vanity of men that the notion that they can effect great improvements in society by the simple process of forbidding all wrong conduct, or conduct which they think is wrong, by law, and of enjoining all good conduct by the same means, as if men could not find out how to live until a book were placed in the hands of every individual, in which the things to be done and those not to be done were clearly set down"

One would think to read the foregoing quotation that Mr Carter had written his lecture with a full knowledge of our Eighteenth Amendment and the Volstead Law, but the fact is that the words quoted were written a dozen years or more before either of these were placed upon our statute books. Even more startling are the sentences which occur at a later page of his book, and may seem to

us almost prophetic in their character

"Take, for instance," says Mr Carter, "the case of laws prohibiting the manufacture or sale of intoxicating drinks The evils of drunkenness are so manifest that great numbers of excellent people are impressed with a conviction that some measures must be taken to repress them The first efforts in this direction were a resort to what are called moral methods The attempt was made to arouse a public sentiment so strong as to prevent men from indulgence, and discourage the sale of the mischievous article, but the results of such efforts are generally too slow and gradual to satisfy aroused and earnest minds Besides the desire of doing good, the selfish determination is formed of carrying out a purpose, and the purpose comes to seem so important that no inquiry is made concerning the means except to consider what will be most effective. It suits the judgment of some and the temper of others to convert the practices they deem so mischievous into crimes, and they think that if nothing else will prevent indulgence in them, the fear of heavy punishment will at least be effective, and indeed many think that the force of law is so great that the mere enactment of a prohibition will accomplish the desired end. and all are inclined to believe that even if the laws are ineffective for the purpose for which they were enacted, they will at least do no

218 LEGAL

harm But men forget that their acts, whether in enacting and attempting to enforce written laws, or of whatever other nature, are subject to the great law of causality and will draw after The law them their inevitable consequences when enacted will not execute itself quires the active interposition of man to put it in force Evidence must be found and prosecutions set in motion, and as this is a task in which good men are commonly found to be unwilling, or too indolent, to voluntarily engage, others must be sought for who will undertake it The spy and informer are hired, but their testimony is open to much impeachment, and is met by opposing testimony often false and perjured. The trials become scenes of perjury and subornation of perjury, and juries find abundant excuses for rendering verdicts of acquittal or persisting in disagree-The whole ments, contrary to their oaths machinery of enforcement fails, or, if it succeeds at all, it is in particular places only, while in others the law is violated with im-Attempts are made to insure a more general and effective execution of the law by imposing the duty of detection upon the ordinary policemen, and giving them summary This enables such officers to extend indulgence for a price, and makes their places positions of value which speedily fall into the hands of those who will not scruple to sell their indulgences, and bribery and corruption on a vast scale are the result The necessity felt by the violators of the law to purchase protection carries the struggle for the control of the police establishment into politics, and mis-An especially chiefs almost endless follow pernicious effect is that society becomes divided between the friends and the foes of the repressive law, and the opposing parties become animated with a hostility which prevents united action for purposes considered beneficial by both Perhaps the worst of all is that the general regard and reverence for law are impaired, a consequence the mischief of which can scarcely be estimated "If, at the expense of all these evils, the re-

"If, at the expense of all these evils, the reformation sought by the law were really and fully effected, the benefit would not be worth the price paid for it, but it generally turns out in the end that the legislation is wholly ineffective and that the condemned practices, through successful bribery and by various devices, are carried on much to the same extent as before the enactment of the law

"What a spectacle is thus afforded of the impotence of man's conscious effort to over-rule the silent and irresistible forces of

Again and again we must remind ourselves in reading Mr Carter's book, that all that he had to say was written more than a dozen

years before the Eighteenth Amendment or the Volstead Law were enacted

"I do not hesitate to say," declares Mr Carter, "that any legislation which bears the characteristics of tyrrany as I have defined that term, is vicious in theory and has never yet succeeded, and will never succeed, in gaining its avowed end, or in having any other than an injurious effect, and I venture to add that if the zeal and labour which have been employed by what are called the better classes of society in efforts to enact and enforce laws repressive of liberty, had been extended in kindly and sympathetic efforts to change and elevate the thoughts and desires of those less fortunate than themselves, a benefit would have been reaped in the diminution of misery and crime which compulsory laws could never accomplish Moral ends can never be gained except by moral means All the advances in civilization and morality which society has thus far made are due to the cultivation and development of those moral sympathies which find their activity in co-operation and mutual aid"

As we look into the origins of law, we become increasingly enabled to grasp the full import of these views The origin of all law is custom The tribes in the lowest scale of civilization had rules of conduct by which they Even among lived and guided their affairs the inhabitants of Terra del Fuego, the Patagonians, the tribes of Australia, the Bushmen of South Africa, and the Wood Veddahs of Ceylon, we find customs having the force of law In these societies, as in those of which the earliest human records still subsist, "there is," says Mr Carter, "a constant restraint upon conduct This consists simply in the obligation felt by each one to do as others do-that is, to conform to custom Every one knows that if he does violence to another, or steals his property, he will excite the resentment of the other, and probably receive from him, and those who will aid him, bodily punishment He will provoke retaliation He will lose the approval and friendship of his fellow tribesmen He will be made in various ways to suffer These are the consequences, known before hand, of a failure to conform to custom, and they are sufficient to secure conformity, not indeed in every instance, but in the great ma-The prime requisite of jority of instances human society, that without which it cannot subsist, is that each member should know what to expect in the conduct of others, and that fair expectations should not be disappointed When he knows this, and only when he knows it, he knows how to act himself This requirement is supplied by conformity to custom"

As man became more civilized, and as the various tribes took up agrarian pursuits, and commenced the cultivation of their lands, se-

lecting this means of livelihood rather than resorting to war, plunder and aggression, custom became more and more developed, and this development kept pace with the development of civilization itself. Finally, in the ancient world, in Greece and Rome, the law assumed a definite and formal shape, and the customs of the people were reduced to writing and scientific form. This development in Great Britain has been traced by every student of the English law. We observe the customs of the people, the customs of the merchants and the mariners finally crystallizing into definite form, and emerging ultimately into that vast body of jurisprudence known as the "common law"

But the history of English institutions, as of that of the civilizations which preceded them, reveals that the growth was a gradual one, and that rules of conduct only became really binding and effective when they conformed to the current theories of right and wrong, finding their origin in custom. Thus, that which is really worthy of the name of "law"—that is, a rule of conduct actually enforced, respected and obeyed—is only that which conforms to the views of conduct held by the great mass of the people whom the law was designed to regulate A law which was behind or in advance of this might have all the legal sanction of law, and yet have none of its real fun-It might be written out damental attributes and passed by the legislature, but unless it was in conformity with custom, it became nothing better than a scrap of paper

What was true historically, is true today, that the proper province of legislation lies in

the wise and prudent contriving and shaping of the rules of conduct to which the great mass of the governed are willing to conform, and which they recognize as proper to be obeyed "The general rule of wisdom," and followed says Mr Carter, "which embraces all these precautions is this that it should be kept constantly in mind by the legislator that the function of the law resting upon custom, the function of legislation and the function, indeed, of all Government are the same, namely, to mark out the sphere in which the individual may freely act in society without encroaching upon the like freedom in others, that this sphere is primarily marked out by the unconscious operation of custom with a wisdom far beyond that of the wit of the wisest, that the function of conscious government, whether in the form of legislation or otherwise, is subsidiary to it, and that all legislation should observe this subordination and never attempt to subvert or supersede that which it is designed to aid "

Law, then, is a rule of conduct by which society compels or restrains the action of its members. But law, to be effective, to be really enforced, must be in general conformity with the customs of the governed, since all rules of conduct, in the last analysis, are based on custom. The function of law is to express and define those customs, not to invent or promulgate new customs, but to provide better means for the regulation of conduct in accordance with the views of what is right and wrong entertained by the great mass of society which the law is passed to regulate

NEWS NOTES

DEANS' CONFERENCE

A conference of the officers of the Medical Society of the State of New York with the Deans of the Medical Colleges of the State and representatives of the State Department of Education, was held on January 11, 1928, to discuss the training of students to practice preventive medicine, and especially to make periodic examinations of adults who were apparently healthy The representatives of the Medical Society took the attitude that the older practitioners were showing an increasing interest in the examinations, and that the younger practitioners were often lukewarm The question arose whether or not the medical schools were emphasizing the subjects as much as they might

Some of the deans said that the subjects of preventive medicine and periodic examinations were comparatively new—only ten years old—but that the medical schools had taught the subjects to students who had graduated during the last five years, and that probably the physicians who had graduated within five years had the point of view of preventive medicine and could make a proper physical examination

Two methods of teaching the medical students were discussed

- 1 To give a course in preventive medicine, and
- 2 To give instruction in the prevention of each disease while that disease is under discussion

It was the opinion of the deans that the instruction should be given in each department. The subject of cancer, for example, its prevention and its recognition in its early stages, should be taught by the departments of medicine and surgery, and diabetes in its early or preclinical

stages would be taught in the department of medicine. The representatives of Cornell, Syracuse, Columbia, and Long Island College Hospital said that these schools were using this method to teach the recognition of diseases in their early stages.

Several of the speakers brought out the mental attitude of the students toward preventive medicine, and some deplored the tendency toward commercialism shown by the younger men. The representatives of the Medical Society thought that the ideals of the profession should be emphasized in the classroom daily, so that the future practitioners would at least be conscious of having had the high ideals brought to their attention Medical students were picked men chosen from a large number of applicants. They were of a type that would respond to the ideals which were presented to them

The Columbia and Cornell representatives said that each student in those colleges was given a physical examination and was taught to make a similar examination of other adults who were apparently healthy

The conferees expressed the view that teachers in the medical schools should be in closer touch with the representatives of the medical societies, especially those of the state and counties, in order to inform the students regarding the modern standards of the practice of medicine. The physicians in the field discuss these standards in their societies, and the teachers in the medical school have the opportunity to impress these standards on medical students at the outset of their careers.

The conference was suggestive of lines of thought which will doubtless be followed up in the future

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Castle Hall, 149th Street and Walton Avenue, on January 18, 1928, was called to order at 9 P M, the retiring President, Dr Friedman, in the Chair

Dr Friedman thanked the members, particularly the Chairman of the Standing Committees, for their cooperation. He especially expressed appreciation of the work done by Dr Podvin, Chairman of The Bulletin Committee. He referred to the new Committees started during his administration, the Social Committee and the Relief Committee. In turning the gavel over to Dr Gitlow, Dr Friedman urged the members to give the incoming Presi-

dent the loyal cooperation which was accorded

After preliminary business, Dr Samuel Gitlow, the newly elected president, took the chair, and addressed the Society as follows

"We have had several Building Committees in the past headed by very able and efficient Chairman who have made sincere efforts to obtain a building. The active members of our Society, who consist of those that attend its meetings, seemed to be almost unanimously for a building, so much so, that a Fifty Dollar assessment per member was voted

"Each year has seen the encroachment of lay health organizations on the practise of

medicine I need not name them seperately, but if they were to increase very greatly in number, medical practise would become practically contract practise and the pauperization of the public would become almost complete There are many such philanthropic endeavors right here in the Bronx Your Committee should get in touch with all, if possible, and direct the medical aspects of them We have only begun this activity, the future will teach

"Public opinion is a potent factor for good We must, if possible, retain the good will of the public. This can only be done if we interest ourselves in some part of their wel-Medical publicity cannot in the future be so circumscribed by obsolete rules of conduct as heretofore. Your Society has so acted in publishing a health column in one of the local newspapers Medical publicity can, however, be distinctly abused when it aims at selfish aggrandizement. It then does greater harm than good We still feel that medical publicity must be carried on by your official Only then is it truly effective and un-We would, therefore, ask that assuming whenever a request for such publicity is received by one of the members that such request be referred to your Publicity Committee, which is The Bulletin Committee

"In connection with this, the education of the public in medical matters is important Your Public Health Committee has done this admirably in the past. We urge an extension of its work along these lines in the future The effect of such propaganda is slow in making itself manifest but must eventually redound to

the benefit of each one of you

"Your county society has only one Section that is an integral part of it-The Medical There are now many special societies, the latest just being formed—a Genito-Urinary Would it not be plausible to constitute all these into an Academy of Medicine that would be associated with your County Society and which would greatly help in the getting and maintaining of a Home?

The following members were elected Charles Engelsher, Richard W Finn, Louis Green, Louis M Leibow, Sophia Locke, Louis Saltzman, Abraham I Schmith, Barney Worken

Dr Boas presented the report of the Committee on Public Health and Medical Education The Committee intends to make a special study of the subjects of the medical care of children in schools, and what the proper policy of the Society should be in relation to the

Baby Health Stations

Dr Cunniffe reported for the Committee on Legislation A bill has been introduced in the State Legislature to license chiropractors and the Health Insurance Bill has again been introduced There is also a bill introduced by the Osteopaths for the purpose of granting them the privilege of doing minor surgery and administering narcotics and antitoxins bill this year differs from previous years in that they ask these privileges only for those men who have earned their licenses through examination since 1909 Dr Cunniffe stated that the State Legislative Committee wants to know our opinion of this bill

Following the general discussion, it was moved and carried that the Society go on record as opposing this bill granting further privi-

leges to Osteopaths

Dr Shiffman, chairman of the Social Committee, reported that the committee is planning a Theater party, the proceeds of which will go to the Relief Fund

The Scientific Program proceeded as follows

Papers

1 A Survey of Our Knowledge of the Nasal Accessory Sinuses — Illustrated by Lantern Slides, A Lobell

2 Fundus Photography—Its Value to the General Practitioner, the Specialist and the Patient - Illustrated by Lantern Slides, Arthur J Bedell

> I J LANDSMAN, MD, Secretary

A special meeting of the Bronx County Medical Society, held at Castle Hall, on Monday, January 23, 1928, was called to order at 9 P M, the President, Dr Gitlow, in the Chair

The meeting was called for the purpose of presenting the following Scientific Program

Paper X-Ray Studies of the Heart, including X-ray Motion Pictures of the Heart in Action-Professor Franz Groedel of the University of Frankfort

Discussion followed which was participated in by Drs David Felberbaum, Jacob Bower, Ernst P Boas, Frank Appel and Elsie Fox Dr Groedel closed the discussion

> I J LANDSMAN, MD, Secretary

QUEENS COUNTY

The annual meeting of the Medical Society of the County of Queens was held at Eagle Palace, Jamaica, on Tuesday evening, November 29th, 1927, at 8 30 o'clock, the president, Joseph S Thomas, M D, in the chair The following were elected to membership

Isidor Black, M.D., Jackson Heights, Isidor Kaminstein, M.D., Jamaica, John O'Flanagan, M.D., Long Island City

Reports were received from the following Committee on Graduate Medical Education by Dr F G Riley Legislative Committee by Dr D E McMahon Committee on Publicity by Dr E E Smith

The Board of Trustees reported and offered the following resolution "Resolved, that the Board of Trustees be authorized to prepare plans and specifications for a new building suitable to the needs of the Society for the adoption by the Society, and prepare subscription blanks and bonds in the amount equal to cost of construction and equipment, said bonds to contain the proviso

"That, the bonds will be redeemed by the Society after payment of the building loan and

mortgage bond from time to time as its funds will warrant, and when redeemed the holder shall be paid the principal of said bonds together with the pro rata share of the net income carned by the Society while such bonds were outstanding, but in no case to exceed the annual return of 6% If no building mortgage is required this bond issue will be secured by a mortgage as collateral

"Furthermore, the Trustees be directed to exchange the old bonds for those of the new

issue upon request"

Action on this resolution was deferred until

January

Several amendments to the constitution and by-laws were adopted after a lengthy discussion

E E SMITH, MD, Secretary

LEGISLATION

Legislative Bulletin number 4 issued January 24, records two bills introduced in the Assembly by Dr Lattin, Chairman of the Public Health Committee One bill, Assembly Int No 334, concurrent Senate Int No 221, would amend the County Law by empowering supervisors of a county not a general health district, to appoint one or more dairy and sanitary inspectors. The bill was referred to the Committee on Internal Affairs

The other bill Assembly Int No 335—concurrent Senate Int No 220—would add a new section to the Health Law requiring that all plans for water purification plants must be approved by the state health commissioner

On January 23 Governor Smith authorized an investigation of the Department of Labor and appointed a Moreland commissioner for that purpose. At the same time, the Senate authorized an increase of power and authority for the legislative investigating committee which has been studying compensation affairs for the last two years. This committee was expected to make its report early in February, but if the recommendation which passed the Senate last night is adopted, the committee's report will very likely be delayed and, accordingly, in the meantime, there will be very little legislation introduced on that subject

The osteopaths have amended their bill to permit them to administer anæsthetics, which makes that part of the bill read as did the one introduced last year "Narcotics for the relief of suffering by administration, but not prescription, anæsthetics, antiseptics, vaccines and antitoxins" This bill will be opposed by the Department of Education, the Department of Health and your Committee

Bulletin number 5, issued January 31, contains the following information

The annual conference of County Society Legislative Chairmen will be held on Tuesday, February 14th, beginning at 11 00 A M, at the DeWitt Clinton Hotel, Albany

A hearing will be held before the Assembly Committee on Codes, Tuesday, February 14th, 200 P M on Assembly Int No 33, Vaughan, on experiments on dogs

Two bills in which we have been particularly interested, were advanced within the last week Assembly Int No 102—Gedney, Senate Int No 245—Walsh, physician to be paid reasonable fee for the examination of motorists charged with intolication, advanced in the Assembly to third reading. Assembly Int No 335—Lattin, Senate Int No 220—Webb, requiring the approval of water purification plants by the State Health Commissioner, has been advanced in the Senate to third reading

Senate Int No 335—Antin A new section is added to the law defining under what conditions the county may recover from the state 50% of the amount of money expended by the board of child welfare during the year

Senate Int No 336—Antin This bill would make it possible for a relative of the mother to receive from the state an award for the care of the mother and children where deprived of their father, under certain conditions, and in the event that the mother should recover from her incapacitation, the discontinuance of the payment of an award to a relative and the continuance of payment of an award to her for care of her children

Assembly Int No 426-Coughlin, is an im-

portant bill relating to the payment for medical services contracted by injured persons

Assembly Int. No 430—Cuvillier, relates to fines for cruelty to animals. It is not clear to us who initiated this bill, but it seems that if these fines are no longer allowed to find their way into the treasury of the Society for the Prevention of Cruelty to Animals, there may be less interest in the future in promoting the anti-vivisection bill

Assembly bills Int No 480 and No 481, introduced by Mr Story, increase the penalties of the narcotic law Last year your committee opposed the severe penalty, because it was pointed out that physicians might readily and unintentionally violate the law in some of its details, especially that part of it which deals with record keeping and making. The bill finally passed with the maximum penalty a misdemeanor Now an amendment has been offered, which in itself appears innocent enough, changing the maximum penalty from misdemeanor to felony, thereby threatening every physician who handles narcotics with the possibility of loss of license, if a bit absent minded, or, if in the stress of a busy practice, he fails to make all of the required records regarding the narcotics he handles Every effort made to make the life of the dope peddler more insecure and difficult, is commendable, but when laws are drawn for that purpose, the physician must be protected in his legitimate practice. It is our opinion that these two bills, and especially Assembly Int. No. 481, should be defeated. Do you support us?

Senate Int No 430—Jacobson, provides for child welfare allowances to a mother whose husband is suffering from an incurable disease

Senate Int No 436—Westall, provides for increase in penalty for the unlawful practice of pharmacology

Senate Int No 444—Byrne, relative to the time in which an action for malpractice must be begun. Senator Byrne, by this bill, endeavors to prolong the time from two to three years in which malpractice suits may be begun.

Senate Int No 445—Byrne, would amend the Civil Practice Act by providing that action to annul marriage where party was a lunatic, may be maintained by other party at any time during continuance of lunacy

Senate Int No 468—Truman, would amend the Workmen's Compensation Law providing that if employee sustains injury not arising out of or in course of employment, he shall not be entitled to compensation or other benefits, but shall have the same right and remedies as a non-employee

REMEMBER—Legislative Conference, Albany, Tuesday, February 14th

ONEIDA COUNTY

The annual meeting of the Medical Society of the County of Oneida was held on the afternoon of January 10th in the Hotel Utica, with the president, Dr E R Evans, in the chair

An invitation was extended to the Medical Society of the State of New York to hold its annual meeting in this city, in 1929, and Dr Hyzer W Jones was nominated chairman of a committee to have the application in charge

Dr J H Ball, the Chairman of the Public Health Committee reported that there had been only two deaths from diphtheria since April, when the toxin antitoxin campaign was inaugurated. One of these deaths was a tengear old child who had refused antitoxin and the other was a woman 55 years old.

Dr Evans in his annual address declared that the prevention of cardiac, cardio renal, and cardio vascular disease is a large problem of today, pointing out the conditions are in-

creasing and a larger part of the population is being incapacitated each year from this cause. Disturbances of metabolic and physical conditions and bacterial infection and its toxins are two major causes of the diseases, he said

"Education of the patients and the general public was advocated by the speaker as a big step toward the goal and he named the agencies of laymen seeking better public health, saying it is the duty of the physicians to instruct the people at every opportunity on how to dodge disease"

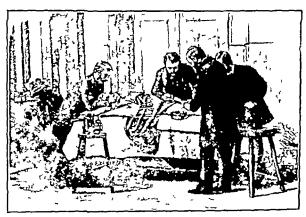

The following officers were elected Dr G M Fisher, Chairman, Legislative Committee, Dr H J Ball, Chairman, Public Health Committee, Dr H H Shaw, Chairman, Milk Commission, Dr T H Farrell, Chairman Public Relations Committee

WILLIAM HALE, JR, Secretary

THE LISTER EXHIBIT OF THE NEW YORK ACADEMY OF MEDICINE

The New York Academy of Medicine has shown an exhibit relating to Lord Lister, the originator of the antiseptic treatment of wounds, in the Library during the months of December and January The exhibit has a personal interest because it was prepared by the Librarian, Dr Archibald Malloch, whose father, Dr Archibald E Malloch, of Hamilton, Ontario, was a house-surgeon of Lister's Among the exhibits was a notebook made in 1868 on the cases treated in Lister's service, a volume of personal letters from Lister, and dressing forceps used by the surgeon

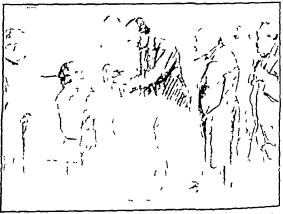

Lister was born April 5, 1827, and was the son of a scientist who did much to perfect the compound microscope He graduated in medicine from London University in 1852 and took up the practice of surgery He became especially interested in hospital gangrene, pyaemia, and applied Pasteur's theory of the microbic cause of putrefaction in his investigations of the suppuration He first tried the plan of applying the pure carbolic acid to the open wounds of compound fractures and thereby prevented suppuration in a large proportion of cases method was announced in an article entitled "A new method of treating compound fractures, abscesses, etc," which was published in the London Lancet of May 16, 1867 This was followed by a second article on "The antiseptic principle in the practice of surgery" in the Lancet of September 21, 1867 Copies of both articles were shown in the exhibit

An operating room of the early eighties

Lister explained the entrance of bacteria into the wound by Pasteur's theory that the organisms came from the air, and so he devised a spray of a solution of carbolic acid which was constantly sprayed on the operator's hand and the wound This method was used for years, but with indifferent success, yet it was the standard method of operating even in the early eighties. A picture of an operating room of about 1881 shows the surgeons, dressed in frock coats as if at a formal

party, operating in a spray of carbolic acid. The odor of their clothes may be imagined. The original caption on the picture reads. "The figure represents the general arrangement of surgeon, assistants, towels, spray, etc., in an operation performed with complete aseptic precautions. The distance of the spray from this wound, the arrangement of the wet towels, the position of the trough containing the instruments, the position

Pencil drawing of Lister inspecting the injured doll of a little girl patient

of the small dish with the lotion, the position of the house surgeon and dresser, so that the former always has his hands in the cloud of the spray and the latter hands the instruments into the spray, and various other points are shown"

An interesting part of the exhibit is a letter from Dr Paolo De Vecchi a Fellow of the Academy who graduated in medicine from Turin in 1872, and whose name appears in the 1927 Medical directory as practicing medicine at 45 Fifth Avenue

The letter describes a dressing which Lister devised A piece of green tissue was laid on the wound, and then seven layers of iodoform gauze, which was covered with a red tissue Lastly a linen bandage was applied and was removed on the third day. If the red tissue had not changed color, the outer bandage was replaced, until the seventh day, when the dressings were removed down to the green tissue. If that had not changed color, the dressings were replaced until the tenth day when healing would normally be complete.

It is hard for a modern physician to realize that the development of the modern method of aseptic technique took over twenty years, and that a whole generation of physicians lived and worked before aseptic surgery was an accepted fact. But Lister lived to see its full development for he died in 1912, tull of years and honors

Lister's kindliness is shown in the exhibit by a pencil drawing of the great surgeon handing a little girl patient her doll in whose body he had sewn up a rent

MEDICAL WARES

HYPODERMIC SYRINGE

The hypodermic syringe may be considered to have displaced the pill box as the peculiar badge of the practitioner of medicine. The first hypodermic medication seems to have been given in 1839 by Drs Taylor and Washngton, two New York physicians, by means of a silver syringe whose end was drawn to a point. Dr. C. G. Pravaz of Lyons, France, made the first hypodermic syringe with a removable needle. The first syringes manufactured in America were made in 1856 by George Tiemann & Company after a foreign model owned by Dr. Fordyce Barker

The first syringes had metal barrels, leather plungers, and screwed-on needles. A modern syringe is all glass, and the needle slips upon the tip in a tight joint. The standard all-glass syringe is known as the Luer after H. Wulfing Luer, an instrument maker of Paris, and was invented in 1896 by one of his employees named Karl Schneider. A Luer syringe means one made according to the original patent issued to Mr. Luer, the American right to which is owned by Becton, Dickinson & Company If another manufacturer wishes to call his product a Luer syringe, he should add his own name to it, as for example, the Luer Syringe, Smith

The question asked the most frequently about the manufacture of hypodermic syringes is "How is the hole made in the needle?" A hypodermic needle is made of hollow wire which comes to the instrument maker in coils many feet in length. The wire itself is made from a billet of steel through whose length a hole is bored. The hole retains its relative size through the whole process of drawing the billet into wire, just as a hollow glass tube retains its central hole even when it is drawn to a hair-like filament.

The hollow wire is cut to the proper lengths, tempered, inserted into the hubs and the finished article is sharpened and honed by hand, and nickel plated. Gold and platinum needles are made by almost the same process as those of steel.

The barrels and plungers of the syringes are made from glass tubing which comes to the manufacturers in six-foot lengths and of various sizes. The tubes are cut to the proper lengths, and are fashioned into barrels and plungers by expert glass blowers, while the glass is softened by heat

The syringe is next inspected for stresses and strains produced in the glass by the heat-

ing and cooling The syringe is held in front of polarized light. A rainbow of color indicates that part of the glass is under a strain that might readily develop into a break when the syringe is heated. The strains are overcome by annealing the glass by heating and cooling it

The plungers and barrels are then measured, and are assorted according to a standard variation of one one-thousandth of an inch in their diameter

The next process is that of grinding the plunger into the barrel. The two parts are first ground roughly separately, and then the plunger is revolved in a lathe while the barrel is ground over it by hand. Each plunger fits its own barrel and no other.

The syringe is then subjected to a test of its tightness. The plunger is withdrawn about two-thirds of the way out of the barrel, and water is forced into the nozzle at a pressure of seventy pounds to the square inch, and is held for ten seconds. If one drop of water leaks past the plunger in the ten seconds, the syringe is rejected, although its parts may be used for grinding into other syringes. The pressure-leakage test is far more severe than that to which a physician will be likely to subject a syringe.

The nozzle tip is also ground to fit the standard needle, but since it is tapered, a tight fit is insured without the individual grinding of a needle to the syringe

A glass hypodermic syringe that is well made and tested will stand a boiling temperature, and its freedom from bacteria is assured Its contents may be seen readily, and its calibrations are so accurate that the syringe may be used for measuring serums and solutions of potent drugs

A hypodermic syringe is a delicate instrument and requires good care. Should the plunger and barrel become stuck, boiling in an aqueous solution of glycerine will usually loosen the plunger. Bi-carbonate of soda should never be added to the water in which glass syringes are to be boiled as this substance has a tendency to attack the ground surface of glass.

The manufacturers suggest that, after the day's work is finished, the syringe be given a final sterilizing in the sterilizer and be thoroughly washed out with alcohol, and the plunger and barrel separated and allowed to remain so overnight

THE DAILY PRESS

CHICAGO'S HEALTH COMMISSIONER

The word politics is applied to any governmental activity including the practice of public health, but the word implies a personal gain to the one doing a political duty It is unfortunate that anyone should consider a public health office as a political job which can be filled by any professional friend of the appointing boss, yet this is what the Commissionership of Chicago seems to appear to the Mayor, for he has displaced Health Commissioner Herman M Bundesen with his own personal physician who is a surgeon with little experience in public health. Dr Bundesen has shown great activity and much originality, and he made such a favorable impression on public health workers throughout the world that they have issued the following statement, which is quoted from the New York Times of January 16

"Permanence of tenure for competent health officials is an absolutely essential factor in the protection of the public against preventable disease, and the case in question seems particularly flagrant in view of the extraordinary record of Bundesen, whose brilliant services have aroused nation-wide admiration Sacrifice of the lives of citizens of Chicago to political exploitation and personal whims is more than a local

matter, since insanitary conditions in one community may react upon an entire continent.

"The action of the Mayor of Chicago strikes a blow at the most tundamental principles of good government It should meet with prompt and vigorous rebuke from all people of Chicago who care for the reputation of their city and it should stimulate citizens everywhere to see that city charters are amended so as to make such interference with good health administration impossible in their own communities"

According to the New York Times, physicians of New York State who signed the statement were Haven Emerson, Livingston Farrand, Louis I Harris, Matthias Nicoll, Jr., and William H Park

A share of the responsibility for conditions in the Chicago health department rests on the physicians of the city The practice of public health is a comparatively new specialty in which physicians generally are only mildly interested The expenence of Chicago is a forcible argument that medical societies should assert their leadership in the practice of public health We wonder if the Mayor of Chicago ever heard of the County Medical Society? And if not, why not?

AMBULANCE CALLS

The New York Times of January 15 contains an article on Ambulance Calls, in New York

City, which says

"An ambulance goes clanging and dodging through traffic in New York City every three and one-half minutes each day of the year There are 148,663 ambulance calls from public and private hospitals in the course of a year, or 407 a day

"The ambulances go out for every imaginable reason, in fact, at times for no reason at all, since the report shows that there were 5,462 'unnecessary calls' These are usually sent in by persons who get excited, and call for an ambulance for some minor accident which does not even require a physician's attention However, when the call is received every case is a potential emergency and the ambulance must

Nearly all the emergency ambulances are er the control of the City and are assigned All, calls for them are and rite districts

made by police, the theory being that the ambulance surgeon is the medical advisor of the policeman In fact, the ambulance doctor ranks as a police lieutenant

Many night calls are made because the family physician does not respond to the sick call A mother becomes alarmed over her croupy child and calls up police headquarters and says she cannot get her family doctor and wants an These calls may be "unambulance physician necessary" from one point of view, but yet the City has a responsibility which it must discharge without being too critical

A cold day is sure to bring four or five calls to one City Hospital to resuscitate some one who has started his automobile with his garage doors closed. This accident is reported to the doors closed police, who puts in an ambulance call at once, but often the ambulance doctor finds the family physician already there

The ambulance system of New York City is

efficient and generous

ONE-FIFTH BRAIN POWER

The daily newspapers have frequently quoted scientists as saying that man's mind is only one-fifth as efficient as it might be. The New York Times, for example, in its issue of January, quotes Dr Frederick Tilney, of the medical department of Columbia University as follows

"I believe the greatest problem in research today is to discover means whereby man can make the best use of the master organ of life, his brain. Man has attained only a fraction, one-fifth of his brain's potential power. He has made great progress in controlling the forces of the earth, but little or no progress in controlling his own nature. War, for example, shows pre-eminently man's lack of control of his primitive instincts."

The article comments as follows on the question which Dr Tilney is trying to solve

"As an example of the new type of research to be conducted, Dr Tilney spoke of persons who led moral and placid lives, while others led lives of violence by preying on society. Is this last class of individuals, he inquired, created by an imperfectly developed brain, or the brain blighted in its growth by prenatal poisons?"

A casual reading of these quotations might give one the impression that the average man was living far below the mental and moral level at which he should live, but the situation also has a most hopeful aspect. Every man has a variety of mental gifts, music, mechanical skill, language, logic, scientific research, and so on through the whole list of human qualities He has these qualities in varying degrees He may be a genius in one line, such as music, and rate low in others While man was entirely individualistic, as in his primitive state of savagery, he had to use certain gifts, such as mechanical genius and keen eyesight, or else he lost his life But modern man can exist and prosper if he uses a single mental quality that of music for example—because other persons supply him with food and shelter and luxuries, and so permit him to use only the musical corner of the brain, and to neglect those which perform other functions

But even modern man, with all the helps of civilization, must make some use of nearly every mental quality that he has The act of crossing a crowded city street is a mental feat of no small degree, and the adaptations of polite society require the study of volumes of

works on etiquette

Man thinks along the lines that he needs
to use in his daily work and pleasure. Most
men can usually live happily and prosperously
by the use of only one-fifth of their mental qualities, but in times of emergency his safety may
depend on the use of qualities which he has
seldom exercised.

AGE GROUPS AND DEATH RATES

City death rates were formerly much higher than those of rural districts, but in recent years they have been more, nearly equal, or even lower. The 1925 death rate of New York City was 12.2 per 1,000 population, while it was 13.3 for the rest of the state. But there is an element in these figures which must be considered in judging the healthfulness of New York City as compared with that of the rest of the state.

Mr Gordias J Drolet, statistician for the New York Tuberculosis and Health Association, was quoted by the New York Times of January 16, as follows

"The population of New York City includes 350,000 more men and women between twenty and forty-five years—the most active and productive period—than are to be found in similar average American population outside of New York City—There are proportionately fewer children and aged persons than persons of early and middle adult life—Women be-

tween 25 and 30 years are 22 per cent more numerous in the city than in the standard American population outside the city, men between the ages of 30 and 35 are 20 per cent more numerous, and the total number of women between 25 and 30 years exceeds the total number of men between 30 and 35 years by 34,489 in the population of the city, the estimated total of which is 5,986,109

"Characteristic age of New York City's population should be considered along with the mortality rate, which is determined to a large extent by the death rate for children and aged New York City's crude death rate in 1926 was 12 84 per 1,000 population, according to the report, which estimates that its death rate on the basis of the average American population would have been 175 points higher"

If the proper corrections were made to the death rates of New York City, the city would have a death rate exceeding that of the rural districts

BOOK REVIEWS

THE FOUNDATIONS OF NUTRITION BY MARY SWARTZ Rose, Ph D 12mo of 501 pages, illustrated York, The Macmillan Company, 1927

Nobody is better qualified to write on this subject than Dr Rose, whose work at the Teachers' College in Columbia University is known throughout the field of medi-

cine and especially of pediatrics

The first chapter is a brief but interesting historical introduction, followed by a chapter on "The Body's Need for Energy and the Source of Supply" Basal Meta-bolism with the Energy Requirements of Adults and Children, are then taken up About one hundred pages of the text is devoted to The Vitamines and the Construction of an Adequate Diet. The appendix contains tables of food values, heights and weights for both children and adults

Dr Rose is not a physician, nevertheless her work on nutrition has been of inestimable value to all interested in the clinical study of nutrition, while the laboratory workers and animal experimenters will find their side of the question fully covered also WM HENRY DONNELLY

METHODS AND PROBLEMS OF MEDICAL EDUCATION Sixth Quarto of 275 pages, illustrated Series Quarto of 104 pages, illustrated New York, N Y, Division of Medical Education of The Rocke-feller Foundation, 1927

The sixth series of these valuable publications is larger than usual Mostly given over to the description of laboratories and libraries here and abroad, our attention is directed to the growing importance of the out-patient clinic in medical education. Numerous illustrations show laboratory set-ups from all over the world

The seventh series is devoted entirely to the school of medicine and dentistry of the University of Rochester Floor plans of the school and hospital are shown, and their heads follow Students will be given opportunity for brief contacts with patients during their first year detailed stories of the different departments written by

SURGERY OF NEOPLASTIC DISEASES BY ELECTROTHERMIC METHODS By GEORGE A. WYETH, M.D. Octavo of 298 pages, with 137 illustrations New York, Paul B. Hoeber, Inc., 1926 Cloth, \$7.50

The author has endeavored in this book to include a fundamental knowledge necessary for some comprehension in the treatment of accessible malignancy by the aid of high frequency currents. The first chapter deals with terminology which has not been standardized. Numerous authors have written about this form of surgical procedure and as everybody has attached his own name, its present status is in quite a confusing state. There is no doubt that this method of endothermy, transthermy, surgical diathermy, dessication, or whatever you choose to call it, has proved quite an addition in our armamentarium in the treatment of superficial neoplasms

The first part of this volume deals with High Frequency currents, its history, derivation, action, and methods of employment. A chapter is devoted to the description of the author's own instrument which rapidly secures a molecular disintegration and a sealing of the blood

vessels without carbonization

The rest of the volume deals with the application of this method to lesions of the mucous membranes and skin These are accompanied by numerous photographs

showing patients before and after treatment.

Most of the reports upon this recent method of surgical procedure have appeared in our literature as small contributions to our various medical journals. For those who are interested in the treatment of accessible tumors it is a very valuable and authoritative volume. B KOVEN

THE HEART AND ITS DISEASES A Handbook for Students and Practitioners By Charles W Charlan, M D 12mo of 216 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$3 50

This is a short, concise and easily read treatise, re stricted to facts as the author knew them and as they more or less definitely have been proven eliminated, and the pertinent facts relating to the heart and its pathology are incorporated in this small volume and written as it is for the student and practitioner nothing is wanting from anatomy of the heart to electro-H C.D cardiographic interpretation of its actions

HISTORY OF CARDIOLOGY By LOUIS FAUGERES BISHOP, MA, MD and John Neilson, Jr, BS, MD an introduction by Victor Robinson, PhC, Octavo of 71 pages, illustrated with portraits York, Medical Life Press, 1927 Cloth, \$500

It is to be regretted that the authors of this "history" limited themselves to 71 pages, for the book itself is proof that a proper history of cardiology cannot be written within that compass. It is more than an abstract. however, and most interesting, but greater length would have permitted more complete consideration.

The subject is divided into the pre-scientific, scientific investigation and scientific application periods Discussion is a matter of personalities and the contribution of each investigator and teacher is emphasized Schott, Groedel, and Mackenzie are subjects for a special chapter entitled "Three Recent Cardiologists" This is followed by one and two-page chapters on "Relation of Infection to Heart Disease," "The Modern Conception of High Blood Pressure," "Aspects of Contemporary Cardiology," and "Conclusions" These last appear hastily prepared, and should be respectively. should be re-written

The reviewer expresses a general opinion when he hopes that a complete history of this subject will be written within the next few years by these same authors FRANK BETHEL CROSS

How to Make the Periodic Health Examination A Manual of Procedure. By Eugene Lyman Fisk, MD, and J RAMSER CRAWFORD, MD Foreword by Major General MERRITTE W IRELAND Octavo of 393 pages, illustrated New York, The Macmillan Company, 1927 Cloth, \$400 Octavo of

The important subject of periodic health examination has been very ably presented in this volume. The work begins with a stimulating chapter upon the purpose and value of this type of medical practice, whose aim is not the diagnosis of so-called disease, but the detection of physical impairment or predisposition to disease and faults in living habits the correction of which would have even a remote beneficial influence on the life of an ındıvıdual

The book is a manual of procedure in conducting periodic health examinations Each system of the body is allotted a chapter, the first portion of which has been written by an expert in that particular field These men have been so minute in their directions for examining their particular parts or regions of the body, that the reader is staggered at the thought of one man putting all this together and doing periodic health examination work in his office. However, the authors quite rightly urge that the general medical man should be the exammer and should call upon the specialist when required.

The chapter on counselling, which, after all, is the crux of the whole procedure, is exceptionally good and contains a mass of practical information that should be of value to all medical men whether they aspire to do periodic health examination work or not.

- MAYNARD, JR

Principles of Chemistry An Introductory Textbook of Inorganic, Organic and Physiological Chemistry for Nurses and Students of Home Economics and Applied Chemistry with Laboratory Experiments By Joseph H Roe, Ph D 12mo of 378 pages, illustrated St Louis, The C V Mosby Company, 1927 Cloth, \$250

The author has succeeded in the really difficult task of introducing the student to the basic facts of chemistry and showing how these go to explain the problems met with in the nursing profession. Primarily intended for students of nursing and home economics, it includes all the elements of inorganic, organic, and physiological chemistry. Laboratory exercises are appended. The topics are well-arranged and the discussion of each is simple and direct.

A. G.

MALARIAL PSYCHOSES AND NEUROSES With Chapters Medico-Legal, and on History, Race Degeneration, Alcohol, and Surgery in Relation to Malaria. By WILLIAM K. ANDERSON, M.D. Quarto of 393 pages, illustrated. New York and London, Oxford University Press, 1927 Cloth, \$1300 (Oxford Medical Publications)

Even in an age of specialization it might at first glance seem that specialization could no further go than in the production of a large octavo volume of 350 pages on "Malarial Psychoses and Neuroses" But the superficial judgment that this work is but an example of a Teutonically assiduous cultivation of a field within a field is at once corrected by the realization that malaria is the oldest disease of which we have any reliable record, that it is the most widespread disease in the world today, and that there are very few neurological syndromes absent from the list of those which the activities of the malarial parasite are capable of evoking. And since there appears to be no comprehensive work dealing with the nervous manifestations of malaria, the present volume "is intended to fill the gap in the pathological history of this nefarious and subtle parasite."

After a brief chapter on The Parasite and a still briefer on Malaria, we come to the fascinating account of Malaria in History and of its Effect on Character and Race Degeneration, wherein much evidence is marshalled to indicate the important part which malaria has played in the history of the world.

An interesting chapter on the Clinical Pathology of the Parasympathetic and Sympathetic Systems, and Endocrine Glands in Malaria discusses in detail the features of sympathetic irritation which dominate the picture in the cold stage, and of parasympathetic which mark the hot stage of the paroxysm. If we recall the similarity of the outstanding features of Addison's disease, of pellegra, and of malarial cachexia, we must be impressed by the evidence of sympathetic-adrenal exhaustion common to all three in their well-developed forms, and in fact serious sympathetic-adrenal damage has been found in many fatal malarias, while Paisseau and Lemaire consider the drenals and the nervous system the most vulnerable organs of the body to malaria

All the psychoses which malaria is capable of inducing are initially confusional states, according to French observers, all other mental states being further developments at a later stage. The second most outstanding feature of malarial mental states is depression, which may develop together with or independently of confusion or may follow upon it, and perhaps it is not generally realized that "black bile," with its inclancholy, was the term applied by the Greeks to what we now know to have been malaria

Space forbids further citation of the contents of this excellent monograph, which can be thoroughly recommended to all who have interest in any aspect of malaria—an interest which must recently have become more widespread with the use of malaria as an agent in the treatment of general paralysis. The book is provided

with a very full bibliography and an index. In general format it maintains the high standard of the Oxford Medical Publications. Henry A. Bunker, Jr.

A Text-Book of Pathology By Alfred Stengel, M.D., and Herbert Fox, M.D. 8th Edition, reset. Octavo of 1138 pages, with 552 illustrations Philadelphia and London, W.B. Saunders Company, 1927 Cloth, \$10.00

The text of this revision, which has been brought up to date, is arranged as is customary, into general and special pathology. It is written in a clear and comprehensive manner, and is profusely illustrated, containing a number of colored plates. The printing is well done and affords easy reading. The subject matter is presented in great detail and presents an easy understanding of the description of the various processes and changes occurring in the body during disease. The index is quite extensive thus affording ready reference to any particularly desired topic in the volume. The book remains a standard among the existing textbooks on pathology and should be of great use to any one who is interested in the structural changes occurring in disease.

A TEXT-BOOK OF PSYCHIATRY FOR STUDENTS AND PRACTITIONERS BY D K HENDERSON, M D, and R. D Gillespie, M D Octavo of 520 pages London and New York, Oxford University Press, 1927 Cloth,

55.50 (Oxford Medical Publications)

This book is dedicated to Dr Adolph Meyer, the dean of American psychiatrists, by the authors who are former resident psychiatrists at the Johns Hopkins Hospital, but at present practicing their specialty in Great Britain. Their book is based on the hypothesis that mental issess is the cumulative result of unhealthy reactions of the individual mind to its environment. This dynamic approach to psychiatry has instilled in the workers in this field a feeling of hopefulness which was wanting in the attitude assumed by the more static and purely descriptive schools of psychiatric workers. The material upon which the book is largely based, has been observed at the Psychiatric Institute at Ward's Island, at the Phipps Institute of Johns Hopkins Hospital, at the Glasgow Royal Mental Hospital at the Cassel Hospital, and at Guy's Hospital. The resources upon which it has been drawn are indeed very rich, and the product is a mighty good one. As a whole, the book is recominended because of its thoroughness, preciseness, and evidence of the authors' experience and good judgment in dealing with their subject matter.

IRVING J SANDS

DIE MORPHIN-ERKRANKUNGEN VON DR BENNO HAHN, Octavo of 166 pages Heidelberg, Dr Herbert Grossberger, (1927) Paper, Marks 680

This treatise describes the present status of the morphine problem on the basis of the recent literature on opiates and from the personal experience of the author. The author has done theoretical and practical research and he presents his conclusions on the nature of the morphine habit and disease and the treatment of these. Morphinism has disseminated enormously in the last ten years, and the physician must become cognizant of his responsibility in the care of these patients.

The subject matter is divided into four chapters. These comprise the history of the spread of the use of morphine, the chemistry and pharmacology of opium and its alkaloids, and their derivatives, the therapeutic uses of morphine, and acute morphine poisoning, chronic morphinism, its causes, symptoms, diagnosis, and treatment

The book contains very useful information and should prove of value to both the general practitioner and the specialist.

Ultra-Violet Combined With Heat and Light. Make Possible a Wide Range of Therapeutic Uses

CLINICAL evidence and the experience of well-known authorities has shown that the new Battle Creek Super Solar Arc Lamp may be successfully used to treat a wide range of the most stubborn and deepseated disorders

Not only does this AD-VANCED-TYPE LAMP possess many improved mechanical features of construction, such as the automatic magnetic feed which prevents loss of time in waiting for the rays to attain adequate intensity, but the superiority of this lamp in the treatment of general constitutional conditions, as well as local surface conditions, is largely due to the combination of rays produced

An ample amount of ultraviolet radiation plus the radiation infra-red, results in the production of a spectrum that most closely approaches that of the sun Since the Super Solar Arc combines ultra-violet and infra-red rays it finds dozens of uses, for rachitic patients, for skin diseases, for relief of congestion, and other conditions The technic of handling this lamp is easily and quickly mastered

Our new bulletin describes fully the many mechanical and therapeutic advantages of the Super Solar Arc May we send you a copy?

under report With the exception of one case which occurred at Bahia, Brazil, in July, 1926, the disease was not reported in the Western Heinisphere

"The devastating epidemics of typhus fever which swept Russia after the World War have definitely passed, although the disease remains endemic in that region. There was no marked

spread of the disease during the year

"Out of a total of 30,450 cases of smallpox reported during the year from 41 States, there were 380 deaths. The disease was the most fatal on the Pacific Coast, which section reported only one-fifth of the total number of cases, but two-thirds of the number of deaths.

"No cases of cholera, yellow fever, or bubonic plague gained entrance to the country during the year Two cases of plague were apprehended aboardship at the United States quarantine station at New Orleans, La, and 17 cases of smallpox and 2 cases of leprosy were detected The discovery at domestic quarantine stations of three cases of plague among rats at Los Angeles, Calif, however, indicates that the disease continues to exist among rodents, and it persists especially among ground squirrels in certain sections of California, and requires vigilance on the part of the health authorities concerned for the protection of the human population

"The work of the Public Health Service in preventing the introduction of diseases from abroad involves both control at domestic ports and medical inspections at certain foreign ports. At domestic ports during the year, 20,284 vessels, 820,793 passengers, and 1,140,922 seamen were inspected by quarantine officers, at insular ports, 2,991 vessels, 169,461 passengers, and 226,373 seamen were inspected, and at foreign ports, 5,954 vessels, 424,172 passengers, and 272,873 seamen were inspected prior to embarking for the United States. A total of 7,116 vessels were fungated, either because of the occurrence of diseases aboard or for the destruction of rodents 31,073 rats were recovered, of which number 18,334 were examined for plague infection.

"The medical examination, by Public Health Service medical officers, of applicants for immigration visas in foreign countries of origin, first mangurated in 1925, in England, Scotland, and Ireland, was extended during the past year to Germany Sweden, Norway, Poland, and Den-The advantages of the system to the prospective immigrants, to the communities of origin, and to the transportation companies resulted in additional requests to the State Department for the extension of the plan to other countries During the year medical examination of applicants for immigration visas were being made by Public Health Service officers at 20 American consulates in eleven countries Out of 148,539

applicants examined during the year, 12,974, or 8.75 per cent, were found to have mental or physical disabilities, 6,580, or 4.43 per cent, were refused visas for medical reasons

"At domestic ports 881,699 alien passengers and 996,317 alien seamen were examined under the immigration law by medical officers of the Public Health Service, and of this number 24,292 passengers and 3,117 seamen were certified for various diseases and disabilities coming under the law"

EPHEDRIN

The lack of prejudice of California physicians against the Chinese is an illustration of the brotherhood of medical men the world over The December California and Western Medicine contains an article on ephedrin from which the following extracts are taken

"Chinese herbs and Chinese herb doctors are

no novelties to Californians

"True, the enforcement of the state medical practice act has eliminated the "Chinese doctor" pretense, so today the dispensers of the herbs must be content to hold themselves out as merchants selling herbs, much as clerks in a modern drug store sell patent medicines. Then again, Chinese herb concoctions often have been far from palatable, and for that reason are usually as unattractive to Western eyes as are the dried fish and what-not imported food products so often on display in the grocery or food depots of a Chinatown district

"With an alien tongue, medicaments unpleas ant to eye and palate, and a therapeutic system based on a philosophy and empiricism not readily understood by the Western brain, it is little wonder that practically all Chinese drugs and methods have been dismissed with little more than shrugs of the shoulders by Western physicians

"Yet Chinese medicine goes back into a legendary period that antedates very considerably the earliest medical records of Westerns Sheng Nung, the Chinese father of medicine (BC 2737), is given credit for compiling the "Great Herbal" The Nei Ching or 'Canon of Medicine' is supposed to have been written about BC 1000

"In the Tang dynasty, about A D 652, a book entitled 'Thousand Gold Remedies' and consisting

of sixty volumes appeared

"A citation of some modern Western discoveries, in contrast with the Chinese may be of passing interest

"The catheter was mentioned by Chinese physicians in the seventh century A D, although Western physicians place its discovery to the credit of Nelaton in 1860

(Continued on page 235, adv xv)

(Continued from page 234, adv xiv)

"Organotherapy was early recorded in China, for sheep thyroid for goiter was used by the Chinese in the sixth century, A D

"Inoculation against smallpox was used in

China as early as 1022, A D

"Chinese state medical schools and examina-

tions are of record in 1068 A D

"The foregoing notes are given because only recently K K. Chen, Ph D, a native of China and a former student of the University of Wisconsin Medical School, called the attention of Western Physicians to Ma Huang, an herb known in Chinese medicine for some five thousand years, and the active principle of which is the alkaloid ephedrin

"Chen, after working out the active principle, found that a Japanese, Nagai, in 1887, had already accomplished this, and that E Merck, in Germany, also reported the process in 1888

"Ephedrin is much like adrenalin in its chemical structure and in its action on the human tissues, and was discovered before adrenalin had been worked out. Strange to say, however, its significance had escaped the observation of Western clinical observers until Chen's presentation of its physiological action in December, 1924

"Here was a Chinese drug Ma Huang, used and understood by the Chinese for hundreds of vears, with an alkaloid possessing distinct advantages over adrenalin for certain purposes. In the last two years it has come into very generous use, particularly among rhinologists, and among internists paying special attention to asthma

"Ephedrin has a pharmacologic action much like that of adrenalin, but its effects last longer. It is more stable, and acts well when given by the mouth. It has a low toxicity. It shows active effects on the circulation, on secretion and on smooth muscle. It seemingly has no habit-forming tendency, and only a few distressing effects such as occasional tremor, weakness and nervousness have been observed.

"It is especially valuable in bronchial asthma and of good use in certain congestions of the nasal membrane such as hay fever. Although it raises the blood pressure, its real clinical value in hypotension has not yet been agreed upon"

FREE CLINICS

The December issue of Northwest Medicine the organ of the medical societies of Oregon, Washington and Idaho, discusses free clinics in the following address?

the following editorial

"Among the topics discussed at the recent annual Conference of Secretaries of State Medical Associations in Chicago, free clinics probably aroused the most interest among those in attendance Dr Jabez N Jackson, president of the

American Medical Association, in the course of his address to the secretaries, introduced the question and gave his personal views on the mat He stated that, while the medical profession has at all times shown a continued, unselfish spirit in relation to its obligation for treating the sick poor, there has gradually been evolved a situation which unjustly calls upon the physician to devote gratuitous services to those well able to pay for them Many hospitals now admit to their chanty departments patients having every visible indica tion of self-supporting status or even of pros-Yet such institutions, although they exact a hospital or clinic free from such patients, do not permit the attending physician to render a bill for his services Dr Jackson quoted the statement of a surgeon, practicing in a prominent metropolitan hospital, who told him that he was allowed to make a charge in only eight out of every one hundred operations he performed This was in spite of the fact that many of the non fee patients paid for private rooms during their stay in the hospital

"In the general discussion of free clinics which followed Dr Jackson's remarks, several interesting facts were brought forth. It was generally agreed that there is an increasing abuse of free clinics, and that this is most marked in teaching centers. In some cities there is actual competition among medical schools to obtain patients for clinical demonstration. The establishment of pay clinics by medical schools is one evidence of this

"At the present time the determination of eligi bility to free medical service in clinics is largely in the hands of lay boards and social service de-In other words, the physicians have Many of them had little voice in the matter hesitate to express their opinions on account of Those in atfear of losing staff appointments tendance at the conference were quite unanimous in a desire to have the organized medical pro, fession, through its county, state and national medical associations, give serious consideration to While the individual the matter of free clinics physician is helpless in combating such abuses when they exist in his community, the profession as an authoritative group can do a great deal toward their proper control"

BIRTH COSTS

The December issue of the Journal of the Michigan State Medical Society contains an editorial on the cost of the birth of a child, in which it says

"From time to time some feature reporter for a newspaper will spill a sob story on the 'cost of

(Continued on page 237, adv vvii)

(Continued from page 236, adv xvi)

being born' Few real facts ever appear in such outbursts. Recently, however, apparently reliable facts have been made by the Heller Committee for Research in Social Economics of the University of California. The one estimate of \$430.24 is what the average cost should be. The second total of \$888.26 is not an average figure but rather that of an isolated case—a former university student who kept an accurate record of all expenditures.

"We do not purpose analysis or comment upon these cost prices We simply submit them inviting our obstetricians to send in their comments

SALIPYRIN "Riedel"

is a chemical combination of antipyrin and salicylic acid. The thera peutic effects of both these components are preserved, although modified by close chemical union and in a very great degree deprived of the dangers of mechanical mixtures.

Salipyrin is distinguished from other salicylates by the comparative

freedom from ill-effects (absence of free antipyrin) and prompt antipyretic and sedative action.

INDICATIONS Influenza, Colds, Catarrh of the Nose and Throat, Rheumatism, Neuralgia, Alcoholic Excess, Pleur isy, Dysmenorrhea, Metrorrhagia, Vaginitis, etc. If given early in the attack, Salipyrin generally succeeds in aborting colds.

Salipyrin is supplied in powder form and as SALIPYRETS in tablets of 71/2 each

Approved by the Council on Phar and Chem. of the American Medical Association for inclusion with N N R.

NORTHWEST MEDICINE

The January issue of Northwest Medicine, the Journal of the State Medical Associations of Oregon, Washington and Idaho, contains an editorial on the completion of twenty-five years of existence of the Journal Its first issue appeared in January, 1903, under the editorship of Dr Clarence A. Smith, of Seattle, Washington, who is still its editor. It was launched under the auspices of the Washington Medical Library Association. The editorial says

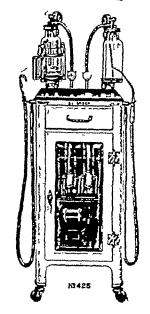

"In 1909 several Portland physicians suggested the formation of a tristate organization, combining the state associations of Oregon, Washington and Idaho, with arrangement for a common meeting to be held every three years, rotating among the three states. At the same time it was provided that Northwest Medicine should be the official publication of this organization. The first combined meeting was held in Seattle in July of that year

"The editor of this Journal reviews the labors of the past quarter century with feel-

ings of pleasure and satisfaction. His relations with the profession of the states which the journal represents have been cordial and harmonious The papers published luring this period have demonstrated that the physicians of this section possess professional accomplishments and literary qualifications that will compare favorably with those in any other part of For the courtesy and confidence the country they have extended toward him in the editing and publishing of the journal he wishes to make grateful acknowledgment, as well as an appreciation of their consideration for any shortcomings and disappointments which have been evident in his work. While he does not anticipate duplicating this period of editorial work, he trusts that it may be prolonged for a reasonable period in the future"

The editors of the New York State Journal of Medicine have frequently quoted Northwest Medicine in its department of "Our Neighbors", and they trust that the present high standard of the journal will be maintained in the future

THE HISTORY OF THE MENTALLY DEFECTIVE

What is a mentally defective person? The January issue of the Atlantic Medical Journal discusses this question in the fol-

-lowing brief editorial

"The word idiot has an interesting history Its primary Greek significance was that of a private as distinguished from a public The beginnings of the person degradation of the word are shown in its application soon to the common people, as distin--guished from the upper classes It was then applied to unprofessional and lay people, and soon became the slurring title of the unskilful and awkward By slow degrees it became applicable to the stupid, and at last to the imbecile and mentally defective As late as the sixteenth and seventeenth centuries the word was still used in the earlier

"This long, sad history portrays indirectly the pathetic story of the imbecile If he was not killed or starved to death by , neglect, etc, he was usually reduced to the condition of a beast, either about the house or fields, or was actually driven into the woods and forced to live in caves, among wild animals, etc In 1799 Itard took a 'wild boy,' found in the forests of Aveyron, and tried to teach him The ability of the wild boys and wolf children to live, and the number that did so, shows that idiocy, as we have later learned, is of all degrees, and that a mind may be variously defective, in some ways even idiotic, but in others with capabilities well preserved Blind Tom, the pianist, and the large number of mathematic idiots are examples that show how far we are from understanding the real nature of idiocy, and they more than suggest the partial retention of sound mentality of the defective, the possibility of seizing upon the one or few normal or even highly developed faculties and perhaps bringing others into coordination with them and to normality The

Poland Water

is not merely a pure table or bottled water, but it is a valuable adjuvant in the treatment of many forms of kidney trouble on account of its bland diuretic properties.

court fools and jesters of the olden times were often such partial idiots and defectives, and they truly lived upon their 'wits,' which were often better than those of their masters"

TUBERCULAR OR TUBER-CULOUS!

The Atlantic Medical Journal for January has an editorial comment on the distinction between the words tubercular and tuberculous, and quotes the Bulletin of the National Tuberculosis Association as follows

"At the second annual meeting of the National Tuberculosis Association, the necessity for clearly defining these two terms was recognized, and the following resolution was adopted solved, That in the interests of clearness and uniformity of nomenclature the Association employ in its official publications the term "tuberculous" to refer to lesions or conditions caused by the tubercle bacillus and the term "tubercular" to describe conditions resembling tubercles but not caused by the tubercle bacil-lus'"

This is the distinction that is accepted according to literary standards, and the editor of this Journal frequently has to correct manuscripts to conform to the distinction. However, the editor of the Atlantic Medical Journal says

"For our own part we object to either the term 'tubercular sanatorium' or 'tuberculous sanatorium' It is not the sanatorium that is tuberculous In this sense, we prefer the use of 'tuberculosis, as a 'tuberculosis sanatorium' or a 'tuberculosis patient.' This usage corresponds with 'diphtheria patient,' 'small-pox hospital,' etc. Let us be Let us be more careful in the employment of terms Just possibly there are times when it might make a vital difference, then it is well to have the habit of proper usage firmly established?

A CONSIDERATION OF THE NEED OF LEGISLATION BEARING UPON THE QUESTION OF EXPERT TESTIMONY.

By LLOYD PAUL STRYKER, ESQ

Counsel Medical Society of the State of New York

T is a favorable symptom of the times that the representatives of the medical profession of Pennsylvania, New Jersey and New York by this splendid gathering, as well as by previous conferences, have attested their desire through a mutual exchange of thought to investigate and discover all that may tend to the advancement of the healing art. It is the very essence of democracy that the representatives of particular calling should themselves debate and consider the need, if there be a need, for the enactment of new laws for the governing of their conduct

Legislators respect, and should respect, the considered views of those to be affected by new In this way, legislators may be helped to greater wisdom, which will find expression in the statute books, and in many instances perhaps will be revealed by a decision to add no further burden to the Gargantuan and unassimilable mass of legislation with which this country already is af-Due in part to worthy motives, in part to the absorption of men in their own affairs and their consequent willingness to let others regulate them without thought or protest, due in part to the great American delusion that the remedy for all our ills is legislation, there has been too great a tendency, particularly marked in late years, to rush to the legislature for the correction of those evils which could be more adequately remedied by the persuasive force of public opinion and the development of conscience

The subject assigned me "A Consideration of the Need of Legislation Bearing Upon the Question of Expert Testimony," is a large but not a new one. More than thirty years ago, it was considered an old theme. You will find, if you examine the early reports of Bar Associations and the contributions to scientific journals, both medical and legal that this subject has engaged the eager thought and anxious study of the lawyers and the doctors who were the leaders of their profession when the oldest of us were young men, and the youngest had not yet been ushered into this strange and complex world

Shakespeare, as well as the dramatists before

his time, the novelists of all ages, the writers and the dramatists of our own day have always found a fruitful subject for their pens in critical discussions of the legal and the medical professions Some have written in praise, perhaps more have censured, but whatever the strictures, just or unjust, throughout the ages mankind has turned confidently to the doctor and to the lawyer with all their problems of body and estate

Perhaps in no other field has the medical man met with so much criticism as in the realm of expert testimony. There is much literature upon the subject. In the trial of innumerable cases where testimony of this kind was introduced, and in the direct and cross-examination of hundreds of expert witnesses, I have been given some acquaintance with the nature of the criticisms, and perhaps have thus been educated to some capacity to appraise them, whether or not I am able to do that which no one else has yet done propose with perfect confidence the one unanswerable remedy.

Let us attend to some of the criticisms of the expert witness, examine briefly into the history and nature of expert testimony, and consider some of the remedies which have been advanced From this, perhaps we may attain to a clearer conception of what we believe and consider advisable to advocate

"Gentlemen of the jury," said an exasperated law yer confronted by the ruin of his case through the testimony of an expert witness called by his adversary, "there are three kinds of liars—the common liar, the description despert" "This characterization," wrote William L. Foster in the Harvard Law Review of October, 1897, "was scarcely more severe than that which, in politer language, is bestowed upon learned and distinguished members of the medical profession, not only by defeated lawyers and their enraged clients, but also by eminent members of the legal profession, both lawyers and judges, as well as by worthy and respectable members of the general public outside of the professions involved. It is the voice of the people and of the press, as well as

that of the bench and the bar. It is the fashion '2

The United States Supreme Court once wrote that "experience has shown that opposite opinions of persons professing to be experts may be obtained to any amount, and it often occurs that not only many days, but even weeks, are consumed in cross-examinations, to test the skill or knowledge of such witnesses and the correctness of their opinions, wasting the time and wearying the patience of both court and jury, and perplexing instead of elucidating the questions involved in the issue"³

In a criminal trial occurring in New York City about thirty years ago "after a week had been consumed in hearing expert testimony upon a subject concerning which an equal number of doctors had testified exactly opposite to each other, and all with equal positiveness, the judge told the jury to put all the expert testimony out of their minds, and pay no attention to it" The judge mischarged the jury in that case, but he expressed something of the current attitude towards expert testimony

In the celebrated Palmer trial in England in 1856 for the murder of one Cook, by poisoning, more than a dozen medical men with great positiveness testified, but in direct opposition to each In charging the jury in that case, Lord Chief Justice Campbell remarked "With regard to the medical witnesses, I must observe that, although there were among them gentlemen of high honor, consummate integrity, and profound scientific knowledge, who came here with a sincere wish to speak the truth, there were also gentlemen whose object was to procure an acquittal of the prisoner It is, in my opinion, indispensable to the administration of justice that a witness should not be turned into an advocate, nor an advocate into a witness"5

In 1874, Professor John Ordronaux declared "There is a growing tendency to look with distrust upon every form of skilled testimony. Fatal exhibitions of scientific inaccuracy and self-contradiction cannot but weaken public confidence in the value of all such evidence. If Science, for a consideration, can be induced to prove anything which a litigant needs in order to sustain his side of the issue, then Science is fairly open to the charge of venality and perjury, rendered the more base by the disguise of natural truth in which she robes herself." And the learned Professor then said. "Some remedy is called for, both in the interests of humanity and justice."

In the Journal of the Franklin Institute, Professor Charles F Himes once wrote "Perhaps the testimony which least deserves credit with the jury is that of the skilled witness. It is often surprising to see with what facility and to what an extent their views can be made to correspond with the wishes or the interests of the parties who call them. They do not, indeed, wilfully misrepresent what they think, but their judgment be-

comes so warped by regarding the subject in one point of view that even when conscientiously disposed, they are incapable of expressing a candid opinion. They are selected on account of their ability to express a favorable opinion, which, there is great reason to believe, is in many instances the result alone of employment and the bias growing out of it "7

After citing these among other criticisms, Mr Foster in his article in the Harvard Law Review "It would be depreviously mentioned, wrote plorable, indeed, if such criticisms were justified by the facts This 'bias,' or inclination in favor of the party by whom the witness is employed, is probably the most frequent complaint of all against the expert witness, and the inclination or partiality is often characterized by terms indicating dishonesty and corruption, but it is my belief, resulting from the observation and experience of many years, that there are few instances in which a scientific witness permits himself to testify or to be engaged on a side contrary to his convictions derived from a careful examination of the case."

"It is not unnatural," continues Mr Foster, "that a man of strong conviction (at the same time honest and unpurchasable) should become the earnest advocate of his theory, and the zealous assistant of the attorney in preparing, and to some extent conducting his case in court, and the attorney does well to secure his testimony and service (and would be negligent and wanting in fidelity to his client if he did not) by a suitable recognition of his value to him and his cause, and I agree with Professor Himes that there is no rule of ethics that should cause the witness to refuse the reward of his labor that would not apply equally to the attorney, so long as the testimony on the witness stand is without conscious untruth On the other hand, neither is there anything in legal ethics to require a lawyer to select a lukewarm, half convinced representative of his theory of the case, and probably he never does But the bias of the expert witness may not always be incidental to his calling or profession, but a purely scientific bias, due to some peculiar view or the-Against such a bias no amount of selfrestraint nor the most sensitive conscience will fortify a man"9 If I may be permitted, I should like to express my humble concurrence with these

In a paper read before the New York State Medical Association on October 24th, 1899, the Hon Willard Bartlett, one of the most distinguished Judges of our highest Court, declared "For more than ten years, the condition of the law in the State of New York in regard to medical expert evidence has been the subject of frequent, active, and often acrimonious discussion among doctors and lawyers Many reforms have been proposed and suggested, but no reform has been carried into effect. In my judgment, the failure in this respect has been largely due to a lack of appreciation of the obstacles to be over-

come Without an adequate knowledge of the difficulties to be encountered, no plan of cam-

paign is likely to be successful "10

Some thirty-seven years ago, Judge Peckham, speaking for our New York Court of Appeals, de-"Expert evidence, so-called, or, in other words evidence of the mere opinion of witnesses, has been used to such an extent that the evidence given by them has come to be looked upon with great suspicion by both courts and juries, and the fact has become very plain that in any case where opinion evidence is admissible, the particular kind of an opinion desired by any party to the investigation can be readily procured by paying the market price therefor He (the expert) comes on the stand to swear in favor of the party calling him, and it may be said that he always justifies by his works the faith that has been placed in

But in his article previously referred to, Judge Willard Bartlett wrote "In reference to this matter, however, I desire to express my dissent from the sweeping condemnation of medical experts in which the courts so often indulge. There is scarcely a case where expert evidence is taken, in which some of the experts are not perfectly honest They do not deserve denunciation merely because other experts are dishonest, or because it is often difficult to tell the false from the true The medical profession itself must help us to make the distinction between the two classes However objectionable are some of the aspects of medical expert evidence, it cannot be dispensed with in the administration of justice. Let us remedy the evils, but, while we are endeavoring to do so, let us avoid that exaggerated denunciation which is calculated to convince the community that no surgeon or physician who takes the witness stand as an expert is worthy of belief Such teaching is a libel on the most unselfish profession in the world "12

Perhaps a better understanding of the nature of the criticisms can at this point be attained by a brief excursion into the history and develop-

ment of expert testimony

"The normal function of a witness," says one of the most authoritative works upon this subject, "is merely to state facts within his personal knowledge, and under ordinary circumstances his opinion or conclusion with respect to matters in issue or relevant to the issue cannot be received "13" "Evidence" in its common acceptation of the term has been defined by Sir James Fitzjames Stephens in his "Digest of the Law of Evidence," as "Statements made by witnesses in court under a legal sanction in relation to matters of fact under inquiry, such statements are called oral evidence." "14"

Thus ordinarily a witness is confined in his testimony to what he himself heard, saw or did—to a statement of the facts. He is not allowed to speculate about them, draw conclusions or inferences from them, or express opinions of any

But "when there is a question as to any point of science or art, the opinions upon that point of persons specially skilled in any such matter are deemed to be relevant facts Such percalled experts The words 'science' or art' include all subjects on which a course of special study or experience is necessary to the formation of an opinion"15 An expert witness is "one who is skilled in some art, trade or science or who has knowledge and experience in relation to matters which are not within the knowledge of men of common education and experience," and the law permits such a witness to "express an opinion on a state of facts which is within his specialty and which is involved in the inquiry "16

Expert testimony is "admitted because the witnesses are supposed, from their experience and study, to have peculiar knowledge upon the subject of inquiry which juriors generally have not, and are thus supposed to be more capable of drawing conclusions from facts and basing opinions upon them than juriors generally are presumed to be "11" Such testimony is allowed where "the jury cannot be supposed to comprehend the significance of facts shown by other testimony, which needs scientific or peculiar explanation by those who do compre-

hend it "18

The law then, based as it is upon common sense, has deemed it necessary in the true administration of justice, that a jury should be enlightened upon questions which are beyond the scope of knowledge possessed by the ordinary man. It forbids the giving of opinions by those not qualified to give them, and permits them from those whose special knowledge and study are deemed sufficient to enable them to express them

The term "expert testimony" is usually associated with the opinions given by physicians, but it is by no means limited to this field. Thus, experts may be called and express opinions upon many other subjects in which the expert is presumed to possess special knowledge, as for example, in logging, manufacturing, mechanics, mercantile affairs, military affairs, mining, natural history, nautical matters, railroads, handwriting, and many other subjects 19

Expert testimony has been permitted in the courts for many centuries. In 1620, in the case of Alsop v. Bowtrell, certain physicians testified that a woman who bore a child forty weeks and nine days after the death of her husband, might well have borne the child of her deceased husband, and that the delay in the delivery was due to ill usage and lack of strength 20. Forty-five years later, in the famous Witches case, Dr. Brown of Norwich expressed his opinion that there were witches, and elaborated this view by a scientific ex-

planation of the fits to which they were subject ²¹ And in 1678, in the murder trial of Rex v Pembroke, physicians were called to express their opinion as to the real cause of the deceased's death. They expressed their opinions as to the causes of certain symptoms observed upon an autopsy they had seen, and upon the general proposition as to whether a man can die of wounds without fever ²²

In 1744, in the case of Rex v Heath, expert testimony was again employed. It was a trial for perjury The defendant was accused of having falsely sworn that one Lady Altham had never had a child The witness testified that he once saw Lady Altham with a "big The counsel then with true Elizabethan directness asked "What do you apprehend became of that big belly?" The question was objected to, and the court declared "The apprehension of a witness is asked where no other evidence can be had in capital cases, as where a witness is produced to prove a wound given, he is asked whether he apprehends that wound was the cause of death That must be asked, for he cannot tell otherwise. It is the best evidence that can be had in that case "28

The historical student of the law will find many other cases going back at least to the early part of the seventeenth century in which expert testimony was allowed. Indeed, so far back as the year 1345 the court summoned surgeons from London to assist in determining whether or not a certain wound was fresh 24 In the early days of our law, special or "struck" juries were summoned composed of men having knowledge of a particular science or art. Thus, for example, in 1645, a court in England summoned a jury of merchants to try a merchant's case "because it was conceived they might have better knowledge of the Matters in Difference which were to be tried than others could who were not of that profession "25"

Thus, in going back into the early history of our institutions, it is found that at a very early day the courts appreciated the desirability and the need of securing expert knowledge, in order properly to determine the issues they were called upon to try Under our system inherited from the earliest days of English history, the jury, with all its faults, has been deemed the best means for determining issues In a certain sense, the opinion of an expert usurps the functions of a jury, and to a limited extent at least, the expert undertakes to decide for himself one or more of the con-It is but natural, tested issues in the case therefore, that expert testimony from an early day, although deemed necessary, has been looked upon with some suspicion and no little jealousy by the courts I have said that the expert decides one or more issues in the case This is true only in a limited sense, masmuch

as the jury being the final arbiter upon all questions of fact, may but is not bound to accept any opinion expressed before it

The nineteenth century saw an advance in scientific knowledge unparalleled in any other similar period of the world's history But the advance did not stop with the close of the cen-It is still going forward—perhaps more rapidly now than ever before This is true in every branch of science engineering, law, mechanics, railroading, medicine, and indeed all To an increasing degree, courts are concerned with questions of science and scientific knowledge So rapid have been the strides in the ascertainment of new truths, that science of all kinds has been divided and subdivided, so that those who are really experts are such only in a particular and limited field the human body, internally and externally, has been split up by the medical profession, and whereas formerly the general practitioner was able to be expert in every field of medicine, today specialization has become inevitable Thus, a physician who confines himself to eyes, ears, nose and throat frequently and with justice deems himself incompetent to know and comprehend intestinal diseases or fractures Similarly, the surgeon and the internist is each specially schooled only in his particular and limited field

With this vast advance in the accumulation of ascertained truth—an accumulation so large that even experts cannot comprehend it all—it is but natural and right that a lay jury, where a scientific question is in issue, should be enlightened upon the particular question of science involved by one who is competent to enlighten them. Not even the sternest critic of expert testimony, therefore, has thus far contended that it should be entirely done away with. It is necessary, it is indispensable

There are certain classes of cases in which expert testimony is most commonly encount-These are in criminal trials where a question of insanity is involved, or as stated in our New York Penal Law, the question of whether or not the accused at the time of committing the alleged criminal act "was laboring under such a defect of reason as 1-not to know the nature and quality of the act he was doing, or 2—not to know that the act was wrong,"26 cases involving the question of the competency of a testator to make a legal will, questions arising in actions for personal injuries, where the question of the extent, the nature and the duration of the injury is involved, and cases of alleged malpractice, where the question is did the physician accused comply with or depart from the recognized treatment in general use Perhaps nowhere so frequently as in criminal trials, has the employment of expert testimony given rise to discussion and criticism All of us recall the Thaw, the Leopold and Loeb and the many other notorious cases as falling within this category

Let us now state and attend to some of the specific criticisms against expert testimony. The most frequent of these may be stated as follows

1 The claim that the expert is biased in favor of the party calling him, and that he thereby becomes in reality an advocate rather than a witness made so by reason of his commitment to and compensation by one side of the controversy

The law has always recognized the right of an expert to compensation for his services. He acquired his knowledge through long study experience and application. His knowledge is his stock in trade. There is no more reason why he should dispense with his wares without compensation than that the merchant should be required to donate his goods without reward. Criticism, therefore, of an expert's compensation is one which the law itself has answered by allowing it. It is a criticism which has no justice

Does an expert witness have bias in favor of the side which calls and pays him? Undoubtedly the opinion which he expresses he endeavors to, and should endeavor to, maintain He is called to express that opinion, and he would be lacking either in conscience or ability if he did not, to the best of capacity, The question, therefore, is not sustain it whether he is biased in favor of the party calling him, but whether or not he has honestly expressed an opinion which he honestly believes in If he has, he has done no more than his duty, and no one should be criticized for that If he has not expressed an honest opinion, undoubtedly he should be censured for it, but how can this be determined?

Medicine is not an exact science sciences exist in which differences of opinion are not possible. If the expert physician's opinion is not honest, he should, in the hands of an able cross-examiner, meet with his just deserts, and the fallacy and error of his opinion should be, and usually is laid bare by this sharp weapon of the law I have cross-exammed hundreds of expert witnesses met with few indeed whose opinions seemed to me intentionally dishonest. Where I have encountered opinions of that kind, perhaps I have had a reasonable amount of success in exposing them But the weapon of cross-examination should be sharpened by a study of the particular scientific question involved, and a readiness to confront the expert with the countervailing views of eminent authorities who have written upon the subject

Where the expert is the "advocate" of the

side which calls him—if what is meant by this is his effort to sustain a given view, irrespective of its validity—such an effort usually is its own undoing, and a demonstration of the insincerity of the opinion redounds to the just disadvantage of the side which sponsors it From my experience, the criticisms which we have just considered do not require the remedy of legislation. The law is already adequate to meet the problem

2 The criticism is often voiced that something should be done about expert testimony, because it results in conflict—differences of opinion—expressed by one side and the other

leading to confusion

The same criticism might be directed toward lay testimony There is always a conflict, one side maintaining one proposition, and the other Our inherited system of court and jury, despite all the criticisms, has since the days of Magna Charta been deemed the wisest means of determining such disputes, and in the long run administering true justice long as there are differences of opinion upon expert questions, especially in the domain of medicine, so long will these differences be voiced and championed in court, as they are elsewhere, in medical consultation, medical conferences, and in the medical journals From this conflict indeed, progress has resulted, and the errors of accepted conclusions have been

Willard Bartlett, in the paper previously alluded to, has discussed this subject with much interest. He refers there to the trial in England many centuries ago of the Suffolk These two old women were brought to trial before Sir Matthew Hale, having been indicted for bewitching several persons Thomas Browne, the celebrated author of Religio Medici, was called as an expert witness for the prosecution Three of the supposed victims were produced in court for his inspec-He also listened to the oral testimony of the prisoners, and the learned Dr Browne then expressed his opinion under oath "that the persons were bewitched, Denmark there had been lately a great discovery of witches, who used the very same way of afflicting persons by conveying pins " as well as "needles and nails" into them This learned expert of three centuries ago then rendered his opinion "that the devil in such cases did work upon the bodies of men and women, upon a natural foundation (that is) to stir up and excite such humors superabounding in their bodies, to a great excess, whereby he did in an extraordinary manner afflict them with such distempers as their bodies were most subject to," and that the swooning fits were 'heightened to a great excess by the subtility of the devil, cooperating with the malice of

these which we term witches, at whose instance he doth these villainies "27

In his instructions to the jury, Sir Matthew Hale told them that there was no doubt that witches did in fact exist. The poor old women were convicted and later they were executed "But" records the reporter, "they confessed nothing" This case, says Willard Bartlett, "emphasizes the objection to any change in the present system which would relieve experts from liability to the fullest cross-examination If cross-examination had been in vogue then, as it is now practiced in the case of expert witnesses, a conviction could hardly have been the result of the trial of the Suffolk witches "28

Judge Bartlett then referred to a case in Califorma in 1899, where the plaintiff, a married woman, was injured in a railway accident. One of the questions litigated was the extent of the injuries she had sustained. She had been examined by three or four medical men on her own behalf, and by as many for the defendant All the experts on both sides agreed that the plaintiff was suffering from a uterine or ovarian tumor, although they differed as to whether the tumor could have been produced by the plaintiff's fall She recovered a verdict of \$20,000 against the railroad Ten days later, she gave birth to a child at full term, although stillborn, and it was admitted that there had been no tumor at all 29

Judge Bartlett refers to this case as demonstrative of the fact that serious error may lurk in the conclusion of experts "even when they have agreed" Had the experts in that Calitornia case differed as to whether the plaintiff was afflicted with a tumor or was pregnant with child, perhaps they would have been criticized for differing Yet, by such a difference, they would have come nearer to the truth than was attained by their unanimous concurrence

I see no reason why expert witnesses should agree, provided they differ honestly difference confuses, the confusion can be cleared up by the clear charge of a competent and honest judge There is always some confusion in the trial of a sharply contested issue of fact, and far more frequently than is generally believed, juries prove themselves entirely competent, with the aid of the lawyers and the judge, to unravel the confusion, arrive at the correct conclusion, and thereby do justice in the case

3 The payment of contingent fees to ex-

perts has been criticized

This criticism is not without some justice The expert should be paid for his opinion, but should have no stake in the outcome of the But what applies to experts, applies equally to lawyers The question of contingent legal fees is now well to the front in the forum of public discussion Probably the sys-

tem is wrong On the other hand, a worthy litigant with a just case, but without financial means, might be deprived of justice if he could not secure the services of a lawyer upon a contingent basis, and this applies to the expert witness also

4 A criticism has also been offered because wealthy litigants are enabled to overawe the jury with a mass of expert testimony to the

disadvantage of poor litigants

There probably is some force in this, but until we attain that ideal state (if it be such) where all men are equal in estate, there is always some advantage in wealth, and a consequent disadvantage in poverty. These differences however, by the law of compensation, usually are equalized Thus, where a wealthy litigant excels in power to marshal witnesses, the poor litigant has the advantage in the matter of sympathy from the jury The jury box and the ballot box are great equalizers and stabilizers in this country

Should poor litigants in civil cases be allowed, upon making petition to the court, to obtain an order assigning them from a selective list one or more experts in their cases, their compensation to be paid in the first instance from the public funds, which funds could be reimbursed from any verdict which the plaintiff might recover and collect?

Such a question might be worthy of consideration, although personally I do not favor Such a plan for poor defendants who are accused of crime, no doubt, is just events, that plan is now in operation in our New York Criminal Courts Through recent amendments to Section 308 of our Code of Criminal Procedure, it is provided that "In any case in which experts may be employed as witnesses and in case it shall appear to the satisfaction of the court or a judge thereof that the defendant is not financially able to employ experts, the court to which the indictment is presented or sent or removed for trial or a judge or justice thereof may direct the employment of expert witnesses for the defendant in number not exceeding the number sworn or to be sworn for the prosecution at an expense in the aggregate of not exceeding the Allowances unsum of ten hundred dollars der this section shall be a charge upon the county in which the indictment in the action is found, to be paid out of the court fund, upon the certificate of the judge

5 A further criticism is urged, in that mistakes may arise even where all experts agree.

This is true, but it is no more true in this field than in any other avenue of human en-So long as there is the personal equadeavor tion, mistakes will happen Lawyers make mistakes, railroad engineers make mistakes, and so also (if you will read the decisions of the higher courts) do judges No legislation can cure this

6 The requirement of the hypothetical question has often been condemned

I do not believe that it has been condemned with great frequency by those who have had long experience in using it. The length and character of the hypothetical question, the trial judge in his sound discretion now has power to regulate. This discretion, like all other discretions, may be and no doubt at times is abused, but this is not a sufficient basis for a sweeping condemnation of hypothetical questions.

The expert must necessarily express his opinion upon some hypothesis He is not there to express a general philosophical view which has no relation to the case at hand called to give an opinion upon the facts in the Nobody knows exactly what the facts will be, until all of the lay witnesses have been examined and cross-examined The hypothetical question places before the expert a state of facts finding its basis in the evidence other words, he is asked to assume facts which have been established in the trial frequently happens that an expert who has reached an opinion based upon the assumptions presented to him by one side or the other in advance of trial, is forced to withdraw that opinion when new facts are developed, or the supposed facts previously presented to him are not established

The hypothetical question must present a hypothesis based upon the established facts If the lawyer asking the question assumes therein facts which have not been established, an objection to the question will be sustained by the trial judge, and he will be forced to reframe his question until it does contain only the facts which have been established parent exception to this rule is found in the permission to propound a hypothetical question based upon facts which the lawyer expects later on in the trial to elicit. The lawyer however follows this practice at his peril, for if later he should fail in establishing the evidence which he has included in his question, the jury will be instructed that it may discount the opinion rendered if they find that it is based upon facts which have not been proved before them

From an experience in propounding and objecting to hundreds of hypothetical questions, it is my opinion that there is no need for legislation on this subject. The discretion of an intelligent and fair judge is a sufficient safeguard.

7 A further ground of criticism of expert testimony frequently stated is based upon the want of satisfactory expertness, with the result that charlatans are permitted to testify

This is the most tenable of any of the grounds of criticism urged. In 'Legal Medicine and Toxicology, 'it has been stated 30 "The great progress of the last fifty years in scientific medicine has been manifested also in an elevation of the principles of forensic medicine Many questions, upon which formerly there would have been a difference of opinion between doctors, have now become established facts We have a better knowledge and a better class of experts to aid in the cause of jus-But even so, there is much improvement to be desired, and expert testimony has still a reputation for uncertainty and difference which better methods in the selection of the expert witnesses and better methods of presentation of their really valuable testimony before the tribunal will finally overcome Among the evils of the present system is that in some departments of legal medicine physicians, who are really not experts in the true sense of the word, can still qualify as such professorship of therapeutics and of insanity in an unimportant medical school, the honorary position of consulting physician to an asylum, or the position of a coroner's physician, does not necessarily qualify a physician as an expert alienist or pathologist, and yet the court generally recognizes such nominal insignia of office as evidence of fitness to testify, although the professor of therapeutics may have no practical knowledge of insanity, though the physician may never have visited the asylum to which he has been made consultant by courtesy, and though the coroner's assistant may have been created by purely political influence, with no regard to his attainments as a patholo-An evil of this kind has perhaps no gist remedy save in the elevation of the ideals and standards of the whole body of medical practitioners Its correction can be made by physicians alone or in cooperation with members of the legal profession, who can in their choice of experts, select only such as are known to be of high reputation for honor and integrity"

The New York law on this subject is that "if a man be in reality an expert upon any given subject belonging to the domain of medicine, his opinion may be received by the court, although he has not a license to practice medicine. But such testimony should be received with great caution and only after the trial court has become fully satisfied that upon the subject as to which the witness is called for the purpose of giving an opinion he is fully competent to speak "si In the case just quoted from, the expert called had not been admitted to practice medicine. The court said of him that he was 'not prima facie competent for this reason, but held that it was possible to

qualify him if it were shown that he possessed the requisite knowledge, even though he had no license to practice

Whether or not a witness is in fact an expert, is a matter solely for the trial court—a question which it must decide upon its conscience after a consideration of the established qualifications or lack of them. The exercise of this discretion one way or the other, is not

open to review upon appeal 32

In his treatise on the law of evidence, Mr Wigmore has written "The trial court must be left to determine absolutely and without review the fact of possession of the required qualification by a particular witness. In most jurisdictions, it is repeatedly declared that the decision upon the experimental qualifications of witnesses should be left to the determination of the trial court "33"

We have no quarrel that the question of the qualification of an expert witness should be determined by the trial judge who, in his discretion, after a consideration of the facts, is empowered to decide whether or not the witness is in fact qualified, and were the trial judges more frequently to decide that an unqualified witness is in fact not qualified, in my opinion most of the criticisms on this branch of our subject would be eliminated

A notable example of this was found in a case tried several years ago by my predecessor In that case, the question involved was whether in the performance of an ethmoidectomy the defendant surgeon had carelessly punctured the wall of the nasal cavity and forced into the orbital cavity an instrument by which the optic nerve was injured or severed, causing the loss of the eye A young doctor was called as an expert for the plaintiff He was twenty-six years old He admitted that he was a "professional testifier as a side line" He had never performed an ethmoidectomy, and did not do any major surgery His practice was confined to giving medicine though he had never performed an operation on the brain, he declared that he would not hesitate to go into court as an expert witness and testify how it should be done

The witness was preliminarily cross-examined by Mr Whiteside, who elicited these admissions Mr Whiteside then challenged the qualifications of the witness, and objected to his being allowed to testify as an expert, to which the trial court responded "In all my experience in court in twenty years, I never knew of a court to exclude testimony of one who offered himself as an expert"

In that case the law should have been such as to enable the Judge preliminarily to rule upon the qualifications of that doctor Under existing law, as he no doubt correctly interpreted it, that young man, who on his admiss-

sion was not qualified as an expert on the subject concerning which he testified, was permitted to give expert testimony. Here is a subject which perhaps calls for legislation

The question of enacting laws for the government of expert testimony has frequently been considered by both the medical and the legal professions. In 1909, for example, a committee of the New York State Bar Association was appointed to report "on the regulation of the introduction of medical expert testimony" The committee consisted of these eminent members of the profession A T Clearwater, Austin G. Fox, William N. Dykman, Louis L. Waters and Adelbert Moot These lawyers invited the cooperation of the Medical Society and the Homeopathic Medical Society of this The medical and the legal professions thus united in a careful consideration of the This committee, in a very well considered and carefully reasoned report, after reciting the various criticisms of expert testimony which had come to them, concluded "After giving to the subject a most careful and thorough consideration and bearing in

"First That the sixth amendment to the Federal Constitution and the fourteenth section of the Bill of Rights of this State require that the accused in all criminal prosecutions has the right to be confronted with the wif-

nesses against him

"Second That every party to an action, civil or criminal, has the constitutional right to call such witnesses as he may deem important to the maintenance of his cause, and the right to cross-examine those who may be called against him, your Committee are of the opinion that the remedy for these evils lies with the Bench and Bar rather than with resort to restrictive

legislation

"Primarily with the Bench — not the trial Bench alone, but the Appellate Tribunals as well, it is within the power of Judges at Nisi Prius, to require a greater degree of competence upon the part of persons claiming to be experts by the simple but effectual method of defining to a jury with force and precision the distinction between a witness proven to be thoroughly qualified to speak upon the subject regarding which his testimony is offered, and one whose claim to speak is predicated principally upon the fact that he is paid to do so

"If Trial Judges will pursue this course and are sustained in so doing by the Appellate Bench, courts of justice will be rid of corrupt and worthless so-called experts, provided the Judges themselves are animated solely by a wish to see justice properly administered

"It is with profound regret, that your Committee is forced to admit that the practice sometimes pursued by some Judges of con-

verting trials into spectacular dramas which not infrequently descend to comedy, and degenerate into farce, degrades the administra-

tion of justice

"Occasional lack of competency and experience in judicial position is one of the misfortunes of our public life, but not less disastrous is the weakness of Judges who find it more agreeable to occupy the center of a stage than to see that justice is carefully administered solely with regard to the rights of the individual and the State

"Nor is the Bar blameless Not only do some of its members connive at the hiring of corrupt and incompetent so-called experts, but they artfully and selfishly cultivate and largely are responsible for the fallacy that a witness is to be discredited if he can be disconcerted ('rattled') Thus the art of cross-examination, so potent for good when fairly and properly used, plays havoc with hard-earned and welldeserved reputations in the hands of lawyers whose sole ambition it is to win Scientific opinion to be of controlling value can be given only under conditions of mental repose haggling, sharp interruptions, uncalled-for wit, insolent comment and the other too common features of important civil and criminal trials are not such conditions While they put some witnesses on their mettle, they throw the majority and the more competent into a state of mind in which all sorts of stupidities may be expected and are committed

"The subject is one of such great and growing importance, and the demand for a reform of existing methods is so widespread and imperious, that your Committee, having in mind the prevalence of professional inertia, have framed a bill, a copy of which is hereto an-

nexed "34

The bill which this committee recommended for enactment was a conservative one. It provided for the appointment by the Appellate Division of each Department of at least ten and not more than sixty physicians in each judicial district "who may be called as Medical Expert Witnesses by the Trial Court or by any party to a civil or criminal action in any of the Courts of this State, and who when so called shall testify and be subject to full examination cross-examination as other witnesses are "st They were to be allowed for their services "such sums as the Presiding Judge may allow, to be at once paid by the Treasurer or other fiscal officer of the County in which the trial is had "30 The bill further provided "This act shall not be construed as limiting the right of parties to call other expert witnesses as heretofore "3" The debate which ensued at the annual meeting when this report was considered, is interesting and instructive

"In my opinion," said Judge Davy, "the ob-

jections to expert testimony could not be remedied by giving the court power to select experts recommended by the New York Medical Society. Such a rule of procedure would be too radical a change from our present system to meet the approval of the legal profession. The experts might also disagree, and would be no more liable to reach a correct conclusion than the experts selected by the defendant or the prosecuting attorney.

"Such a restriction would deny the accused in a criminal case of his constitutional right to summon and employ his own witnesses

"Neither would I favor a jury composed wholly or in part of experts, they would be no more liable to agree in the jury box than on the witness stand. A jury constituted as our juries are forms the very best tribunal for the trial of disputed questions of fact, even where scientific questions are involved. Men who ordinarily compose our juries are more likely to arrive at an impartial and correct conclusion than a jury of experts. They certainly would not be influenced by pride of opinion, as might be the case with experts."

And Judge Davy further said "I would, however, make the qualification of expert witnesses rigid in its requirements, and no expert in a capital case should be permitted to express an opinion unless he has made a specialty of the particular disease which is the subject of inquiry" 30

And he went on "I am also aware that there is a tendency among some professional experts to make excuses for crime by increasing the number of mental diseases called insanity This is one cause for severe criticism to which the medical expert has been subjected by the legal profession and the public, but I am unable to discover any remedy for this class of testimony, or any good reason for excluding it The testimony of an expert upon any branch of insanity which tends to establish the fact that the party who committed the alleged criminal act was laboring under such a defect of reason as not to know the nature and quality of the act he was doing, or not to know the act was wrong, is competent evidence, and can-not be excluded "40

And Judge Davy further said "I am also opposed to the court selecting a certain number of the expert witnesses recommended by the State Medical Society. The mere fact that the court selects them would not make them more reliable or honest in giving their testimony. An honest expert witness will give an honest opinion, regardless of the question of compensation or who employs him, and a dishonest witness cannot be relied upon under any circumstances in giving his testimony. There would also be great danger that the jury would

qualify him if it were shown that he possessed the requisite knowledge, even though he had no license to practice

Whether or not a witness is in fact an expert, is a matter solely for the trial court—a question which it must decide upon its conscience after a consideration of the established qualifications or lack of them. The exercise of this discretion one way or the other, is not open to review upon appeal 32

In his treatise on the law of evidence, Mr Wigmore has written "The trial court must be left to determine absolutely and without review the fact of possession of the required qualification by a particular witness. In most jurisdictions, it is repeatedly declared that the decision upon the experimental qualifications of witnesses should be left to the determination of the trial court "35"

We have no quarrel that the question of the qualification of an expert witness should be determined by the trial judge who, in his discretion, after a consideration of the facts, is empowered to decide whether or not the witness is in fact qualified, and were the trial judges more frequently to decide that an unqualified witness is in fact not qualified, in my opinion most of the criticisms on this branch of our subject would be eliminated

A notable example of this was found in a case tried several years ago by my predecessor In that case, the question involved was whether in the performance of an ethmoidectomy the defendant surgeon had carelessly punctured the wall of the nasal cavity and forced into the orbital cavity an instrument by which the optic nerve was injured or severed, A young doctor causing the loss of the eye was called as an expert for the plaintiff was twenty-six years old He admitted that he was a "professional testifier as a side line" He had never performed an ethmoidectomy, and did not do any major surgery His practice was confined to giving medicine though he had never performed an operation on the brain, he declared that he would not hesitate to go into court as an expert witness and testify how it should be done

The witness was preliminarily cross-examined by Mr Whiteside, who elicited these admissions Mr Whiteside then challenged the qualifications of the witness, and objected to his being allowed to testify as an expert, to which the trial court responded "In all my experience in court in twenty years, I never knew of a court to exclude testimony of one who offered himself as an expert"

In that case the law should have been such as to enable the Judge preliminarily to rule upon the qualifications of that doctor Under existing law, as he no doubt correctly interpreted it, that young man, who on his admiss-

sion was not qualified as an expert on the subject concerning which he testified, was permitted to give expert testimony. Here is a subject which perhaps calls for legislation

The question of enacting laws for the government of expert testimony has frequently been considered by both the medical and the legal professions In 1909, for example, a committee of the New York State Bar Association was appointed to report "on the regulation of the introduction of medical expert testimony" The committee consisted of these eminent members of the profession A T Clearwater, Austin G Fox, William N Dykman, Louis L Waters and Adelbert Moot These lawyers invited the cooperation of the Medical Society and the Homeopathic Medical Society of this The medical and the legal professions thus united in a careful consideration of the This committee, in a very well considered and carefully reasoned report, after reciting the various criticisms of expert testi mony which had come to them, concluded "After giving to the subject a most careful and thorough consideration and bearing in mind-

"First That the sixth amendment to the Federal Constitution and the fourteenth section of the Bill of Rights of this State require that the accused in all criminal prosecutions has the right to be confronted with the witnesses against him

"Second That every party to an action, civil or criminal, has the constitutional right to call such witnesses as he may deem important to the maintenance of his cause, and the right to cross-examine those who may be called against him, your Committee are of the opinion that the remedy for these evils lies with the Bench and Bar rather than with resort to restrictive legislation

"Primarily with the Bench — not the trial Bench alone, but the Appellate Tribunals as well, it is within the power of Judges at Nin Prius, to require a greater degree of competence upon the part of persons claiming to be experis by the simple but effectual method of defining to a jury with force and precision the distinction between a witness proven to be thoroughly qualified to speak upon the subject regarding which his testimony is offered, and one whose claim to speak is predicated principally upon the fact that he is paid to do so

"If Trial Judges will pursue this course and are sustained in so doing by the Appellate Bench, courts of justice will be rid of corrupt and worthless so-called experts, provided the Judges themselves are animated solely by a wish to see justice properly administered

"It is with profound regret, that your Committee is forced to admit that the practice sometimes pursued by some Judges of con-

verting trials into spectacular dramas which not infrequently descend to comedy, and degenerate into farce, degrades the administration of justice

"Occasional lack of competency and experience in judicial position is one of the misfortunes of our public life, but not less disastrous is the weakness of Judges who find it more agreeable to occupy the center of a stage than to see that justice is carefully administered solely with regard to the rights of the individual and the State

"Nor is the Bar blameless Not only do some of its members connive at the hiring of corrupt and incompetent so-called experts, but they artfully and selfishly cultivate and largely are responsible for the fallacy that a witness is to be discredited if he can be disconcerted ('rattled') Thus the art of cross-examination, so potent for good when fairly and properly used, plays havoc with hard-earned and welldeserved reputations in the hands of lawyers Scientific whose sole ambition it is to win opinion to be of controlling value can be given only under conditions of mental repose haggling, sharp interruptions, uncalled-for wit, insolent comment and the other too common features of important civil and criminal trials are not such conditions While they put some witnesses on their mettle, they throw the majority and the more competent into a state of mind in which all sorts of stupidities may be expected and are committed

"The subject is one of such great and growing importance, and the demand for a reform of existing methods is so widespread and imperious, that your Committee, having in mind the prevalence of professional inertia, have framed a bill, a copy of which is hereto annexed"

"""

The bill which this committee recommended for enactment was a conservative one It provided for the appointment by the Appellate Division of each Department of at least ten and not more than sixty physicians in each judicial district "who may be called as Medical Expert Witnesses by the Trial Court or by any party to a civil or criminal action in any of the Courts of this State, and who when so called shall testify and be subject to full examination and cross-examination as other witnesses are "35 They were to be allowed for their services "such sums as the Presiding Judge may allow, to be at once paid by the Treasurer or other fiscal officer of the County in which the trial is had "as The bill further provided "This act shall not be construed as limiting the right of parties to call other expert witnesses as heretofore "5" The debate which ensued at the annual meeting when this report was considered, is interesting and instructive

"In my opinion," said Judge Davy, "the ob-

jections to expert testimony could not be remedied by giving the court power to select experts recommended by the New York Medical Society. Such a rule of procedure would be too radical a change from our present system to meet the approval of the legal profession. The experts might also disagree, and would be no more liable to reach a correct conclusion than the experts selected by the defendant or the prosecuting attorney.

"Such a restriction would deny the accused in a criminal case of his constitutional right to summon and employ his own witnesses

"Neither would I favor a jury composed wholly or in part of experts, they would be no more liable to agree in the jury box than on the witness stand. A jury constituted as our juries are forms the very best tribunal for the trial of disputed questions of fact, even where scientific questions are involved. Men who ordinarily compose our juries are more likely to arrive at an impartial and correct conclusion than a jury of experts. They certainly would not be influenced by pride of opinion, as might be the case with experts."

And Judge Davy further said "I would, however, make the qualification of expert witnesses rigid in its requirements, and no expert in a capital case should be permitted to express an opinion unless he has made a specialty of the particular disease which is the subject of inquiry" 39

And he went on "I am also aware that there is a tendency among some professional experts to make excuses for crime by increasing the number of mental diseases called insanity This is one cause for severe criticism to which the medical expert has been subjected by the legal profession and the public, but I am unable to discover any remedy for this class of testimony, or any good reason for excluding it The testimony of an expert upon any branch of insanity which tends to establish the fact that the party who committed the alleged criminal act was laboring under such a defect of reason as not to know the nature and quality of the act he was doing, or not to know the act was wrong, is competent evidence, and cannot be excluded."40

And Judge Davy further said "I am also opposed to the court selecting a certain number of the expert witnesses recommended by the State Medical Society. The mere fact that the court selects them would not make them more reliable or honest in giving their testimony. An honest expert witness will give an honest opinion, regardless of the question of compensation or who employs him, and a dishonest witness cannot be relied upon under any circumstances in giving his testimony. There would also be great danger that the jury would

be unconsciously biased in favor of the witnesses selected by the court "11

Despite the objections of Judge Davy and others, the report of the committee was accepted, and the New York State Bar Association went on record in favor of the bill which had been drawn. But the bill did not become a law

The idea of having the court appoint experts was not a new one The suggestion had frequently before been made that this right should exist, and that no witnesses except those designated by the court should be called Concerning this suggestion, Judge Bartlett in the article previously referred to, said "I believe that justice in the United States is generally well and honestly administered, but such a thing is conceivable as that a judge might unwittingly appoint incompetent official experts who were anything but representative of the best element in the medical profession In what position, then, might a physician sued for malpractice, find himself, if condemned by their opinions and unable to evonerate himself by calling as witnesses his non-official brethren whose testimony would demonstrate that the appointees of the court were wilfully wrong, or ignorantly mistaken? A man may be a good judge of law and yet be a very poor judge of doctors I should be sorry to have to be treated by the physicians of several able judges whom I have known in past years, and yet, I am certain that in each case his physician would have been the first either of these judges would select for any official medico-legal preferment within his power to bestow "42

A more recent suggestion for legislation upon the subject of expert testimony came to our attention a few days ago. It appears that at the House of Delegates of the American Medical Society in Dallas in 1926, the principle that the courts be authorized to appoint expert witnesses payable out of the public funds, who would furnish a written report, was endorsed 43 A draft of a proposed bill, concededly not a final one, was prepared by the Bureau of Legal Medicine and Legislation of the A M A Under this bill, it is provided that any party may petition the court for the appointment of "such expert witnesses as in the opinion of the trial judge may be proper, to investigate the facts of the case and to testify with respect to them, or to give opinion evidence, or to do both, either generally or within such field as the petitioner or petitioners may name and the trial judge approve," but it is also provided that "any party to a cause may elect" whether he will make such petition or "will introduce expert witnesses on his own account in the manner now authorized by law" The petitioner shall state in his petition "the problems to be submitted to the expert witnesses,

if any be appointed," and it is provided that hypothetical questions, if any, "be submitted in the petition," and that these "shall be based exclusively on assumed facts set out in the petition, which the petitioner undertakes to prove" If the court grants the petition, then the experts appointed by the court preclude the person who has petitioned for them from calling other experts

The bill further provides "Each expert witness so appointed and commissioned by the court shall have the right to examine all evidence pertinent to the issues that have been submitted to him, which evidence it is proposed to introduce in the case on behalf of the party or parties at whose instance such expert witness was appointed Each expert witness so appointed may examine under oath such witnesses as may be produced before him by any party or parties, and may administer oaths for that purpose" The experts appointed are required to state to the court "the problem or problems as presented by the court," their analysis of the problem, the evidence submitted to the expert witnesses or collected by them, the names of the witnesses examined by the expert witnesses, and the experts' deduction from all the evidence submitted to them

The bill further provides that the report of the expert, although open to objection and exception by either party, "shall be read to the court or jury, as the case may be, in the presence of such expert witnesses," and thereafter such experts may be subject to cross-examination like other parties, "but the qualifications of such expert witnesses shall not be open to attack "The bill further provides that the presiding Judge or the jury "shall consider and give due weight to the methods of their respective appointments, whether by the court or directly by any party or parties"

In my opinion, this bill is subject to so many criticisms that it would be difficult to state them all, but I shall endeavor to state some of them

First It erects the expert appointed by the court into the position of a quasi-referee, enables him to "examine under oath such witnesses as may be produced before him by any party or parties and may administer oaths for that purpose" It provides then for what amounts to a preliminary trial to be presided over by a doctor who, though excellent in his own profession, may have a very hazy knowledge of the rules of evidence, and the methods of eliciting testimony. He might do so well or ill, according to his peculiar ability. It would be strange if he did not elicit much hearsay or other incompetent proof upon which he would, although he should not, base his expert opinion. Such a course would immeasur-

ably increase the complexities of a lawsuit, and would result in that worst of all legal evils-

the law's delay

Second Through lack of proper training, or perhaps lack of time, such a quasi-referee, acting in the guise of an expert, might fail to summon witnesses who could testify as to relevant and essential lay facts, and hence the opinion which the expert would reach would not be based upon the facts that would be elicited at the trial

The provision that the hypothetical Third question should be submitted to the expert in advance of the trial, has the obvious defect that while it may represent that which the lawyer presenting it may hope to prove, it may not represent at all that which at the trial he would succeed in proving, and hence the whole hypothesis upon which the expert is invited to express his opinion would be false or faulty

Fourth The expert under this bill is directed to "report on and testify as to any problem or problems submitted to him" This provision seems little short of absurd upon "problems" that an expert witness is required to give his opinion, but on a definite, concrete statement of facts established by

sworn lay testimony at the trial

Fifth The provision of the bill that the person securing the appointment of an expert witness is precluded from calling other experts, would deny him a substantial right if the expert appointed by the court were mistaken in his opinion or if, as Judge Bartlett suggested, the expert deemed competent by the court were in fact not competent. The party who had followed this procedure would be denied the opportunity of introducing a competent and proper opinion at the trial

Sixth The provision that the expert's report made before the trial should be read in evidence, is thoroughly unsound. If this report contains in it incompetent lay testimony, and opinions predicated upon facts which are not proven, then improper evidence is laid before the jury, of a prejudicial character and detrimental to the true administration of justice

Seventh The provision of the bill requiring that the qualifications of the experts appointed by the court "shall not be open to attack," is also bad If the expert is incompetent, and his opinion is wrong, it should be attacked, and his report should not be immune from attack merely because it is made by an expert appointed

by the court.

Eighth The bill further, in providing that in contrasting the testimony of expert witnesses appointed by the court and those not appointed, "due weight" should be given "to the methods of their respective appointments, draws an arbitrary and unfounded distinction in favor of the expert appointed by the court,

and against the expert which the court has not appointed, which distinction may not be based upon the competency of the experts and the value of their opinions, but upon a mere arbitrary distinction

But assuming that all of these objections were unsound, the provision enabling the party either to petition the court to appoint the expert, or to "elect" to "introduce expert witnesses on his own account in the manner now authorized by law," renders the whole bill a

mere gesture

In France and Germany, we are told, there is in vogue a system by which the court may order an investigation by experts, either selected conjointly by the contending parties, or appointed by the court itself. In either country, the court may be guided by the expert opinion signed and submitted to it, or may order a new investigation, or finally may feel not constrained to be bound by such opinion if opposed to the judge's own convictions

There is little, if any, value in studying the precedents of France and Germany, whose jurisprudence, as is well known, is based upon the Roman law Their whole system of administering justice differs fundamentally from ours Under the English and American law, the right to call any witness whom the party chooses, and the right to examine and cross-examine them in open court, for many centuries has been deemed a cherished right necessary for the true administration of justice

In his paper read before the New York State Medical Society so frequently referred to, Judge Bartlett suggested that the proper remedy for existing evils in expert testimony lies in adequate amendments of the code of ethics by which physicians and surgeons regulate their own conduct "By that code," Judge Bartlett said, "you regulate your own conduct in the practice of medicine, and insist that those who join the ranks of your profession from year to year shall agree to regulate theirs No statute could practically be more binding Why may you not extend its provisions so as to embrace the conduct of the medical man when he assumes the role of the expert witness? The matter is absolutely within your own control You can declare in your code that a certain course of action on the part of a medical expert shall be deemed honorable and professional, and that a certain other course of action shall be dishonorable and unprofessional A signal advantage of dealing with the subject in this way is that it would involve no interference with existing rules of judicial procedure The rights of litigants or the manner of trying lawsuits would in no wise be affected. The needed reforms would be brought about by the compulsory operation

of your own code of ethics acting personally

upon each member of your profession code, amended as I am sure it might be if the physicians and surgeons of this country took the matter seriously in hand, by commanding medical experts to do what is right and subjecting them to professional censure and obloquy if they did what was wrong, would be more efficacious than any law on the subject which any legislature could enact It would be your own law, adopted by yourselves for yourselves, and it would have that powerful sanction which belongs alone to laws which are a natural growth out of the conditions which lead to their adoption. To the action of your profession in some such way as this, I look with more confidence than anywhere else for the ultimate accomplishment of all that is desirable in the improvement of medical expert evidence "45

Having listened so long, perhaps you would be interested in, whether or not you may be persuaded by my own conclusions on this subject. These conclusions are

First There are existing evils in expert testimony. But how many, if any of these, should or could be remedied by legislation is another question. The fact that evils exist does not prove that legislation is the remedy. In this country too many rather than too few laws are passed. Many new enactments are ill-considered, some of them seem hardly to have been considered at all. Let us, therefore, make haste slowly in the advocacy of new statutes, and if we are to sponsor anything, let us be certain beyond a peradventure that that which we espouse will improve rather than make worse the conditions now obtaining.

Second I believe in our inherited Anglo-Saxon system of the administration of justice through the medium of court and jury, where every witness must be publicly examined and cross-examined in open court, and where no witnesses are entitled to any further rights or privileges than any other, where each must stand or fall, dependent upon the veracity, the character and the intelligence which he has brought with him to the witness stand

Third I am against the appointment of expert witnesses by the courts in civil cases Such an arrangement, if it precludes a party of the privilege of calling those of his own selection, deprives him of a substantial right,—the right to produce testimony of his own selection, and which in many instances may be of greater scientific and probative force than that obtainable from official appointees The appointment of experts by the courts is open to serious constitutional question and indeed in at least one jurisdiction,46 such a law has been declared unconstitutional An arrangement whereby a party may call his own experts, in addition to those appointed by the courts, or

may choose which he will call, would render any supposed advantage in having court-appointed experts nugatory, and would add to the complexity and technicality of court procedure already far too deeply enmeshed in that to which laymen, not without just cause, have so frequently referred as "red tape" It would increase that ill of which since Shakespeare's time, mankind justly has been complaining "the law's delay"

Fourth I would not interfere with the hypothetical question, nor deprive an expert witness of the widest latitude (provided his answer is based upon the proven facts on which the hypothetical question is predicated) in expressing any opinion which his conscience and scientific knowledge will enable him to

express

Fifth The only legislation which I would favor would be that clarifying and sustaining the discretion of the trial judge in deciding in the first instance, whether or not a witness is in fact, qualified to give expert testimony on the specific matter concerning which he has been called to render his opinion, and I would make it clear that the mere fact that a man has been licensed to practice medicine does not in itself qualify him to express an expert opinion, unless on his sworn testimony it appears that by special knowledge and experience he is in truth and in fact qualified to express it upon the particular subject in hand Whether he is qualified or not is a question which should be clearly lodged within the sound discretion of the trial court

Legislation of the kind proposed Sixth might help, but the real remedy for existing evils lies in the better development of conscience on the part of those who now for pay express opinions in which they do not honestly believe or, who for hire advance unfounded or disproven theories in an effort to thwart jus-This remedy,-the development of conscience-could best be made effective through the suggestion of Judge Willard Bartlett the adoption of an amendment to the doctors' principles of ethical conduct specifically and in clear terms condemning as unprofessional those practices which our enlightened lay and scientific opinion agree in condemning as improper and unworthy

I have been asked in this paper to express my own conclusions, and I have done so without fear or favor I should, however, make it clear that they are my own conclusions and do not purport to be those of any client whom I serve

THE LEGAL STANDARDS FOR ERGOT AND ITS FLUID EXTRACT

By H H RUSBY, M D, NEW YORK, N Y

HERE is abundant and incontrovertible evidence that, for some time past, ergot that does not comply with official requirements has been imported and used in the manufacture of the fluid extract The imperfections, however glaring they may appear in the ergot, are not detected by the official test applied to the fluid extract Hence, the Pharmacopæia forbids the making of the fluid extract, unless the ergot itself has been examined and found to be perfect. The custom has gradually grown of placing entire reliance on the biological test for determining the activity of the fluid extract in darkening the comb of a rooster, and there has been a growing neglect of attention to the quality of the ergot used Assuming that the biological test correctly indicates the therapeutical efficiency of a preparation, which is not much more than assumption, it affords no indication whatever as to purity, which the Pharmacopæia makers regard as of equal importance with the strength, and which is primary, as affecting the drug

The U S P requirements, approximately ten in number are divisible into a group of mne which, generally speaking, relate to purity, and one, which relates to strength nine provide, among other things, that the ergot shall be "carefully dried at a low temperature," packed in tight containers, kept not more than one year before being used, and be free from mouldiness, insects and insect excreta, decomposition, rancidity, and offensive odor What physician would recommend, or what patient would want to take a preparation made from ergot that failed in these particulars? Yet an ergot that fails in everyone of them may fully meet the test on the rooster's comb, and has done so in a vast number of cases No reasonable objection can be made to the provision on page four of the Pharmacopæia, that the fluid extract "shall be made only from" ergot that conforms to the physical descriptions and tests of that work

It is unfortunate that this question of the acceptability or non-acceptability of a shipment of ergot should have come to be expressed by the use of the terms "Russian" and "Spanish" It is not because an ergot is Russian that it is almost invariably objectionable, but because of the objectionable mode of preparing, storing, and shipping it that prevails in Russia Russian ergot per se does not differ materially from any other but in my long experience, I hardly ever have known a lot of it to be dried as the Pharmacopæia directs, or to be packed in anything but bags. Such an ergot should be promptly rejected by the Port

authorities, merely because it violates the legal requirement, as expressed in the definition of ergot in the Pharmacopæia, and without regard to its character However, its character must be non-standard when it is thus supplied If this were not so, the Pharmacopæia would not establish this provision When I was exammer of drugs at the Port of New York, I have saved large shipments of Russian ergot by getting it spread out promptly and dried, but in most cases, it had already suffered too much damage to be admissible Fermentation, mould, and decomposition start in it almost immediately when so packed, in the damp condition that usually prevails, and it requires but a short time for it to become unacceptable The fact that such ergot will cause the darkening of a rooster's comb is no evidence that it is fit for use, but it is conclusive evidence that this biological test is not suitable as a sole condition for the admission and manufacture of the drug The people generally are realizing that physicians are generally actuated by altruistic motives, and that they deplore commercialism and the exploitation of those afflicted with sickness However, there is still need of eternal vigilance in permitting legislation that is detrimental to public health The Committee on Legislation in Albany will watch the proceedings of the Legislature, but the legislative committees of the County Medical Societies are charged with the responsibility of informing their legislators regarding the bills in which physicians are inter-I believe that most of the ergot that has been used for six months past, or more, has been of this sort, though of course, it has not all represented the worst of the conditions here depicted

One cannot altogether absolve manufacturers from criticism for using such a drug. It

is their business to be perfectly familiar with the Pharmacopœia requirements and with the qualities of the drugs that they employ Nevertheless, some consideration is to be shown, when a condition has gradually developed in which the biological test has come to be regarded as an all-sufficient indication of quality

Just here is where government "Regulation No 30" enters to permit the pollution of our This regulation provides that ergot supplies if the strength of the ergot—that is, as tested on the rooster—is sub-standard, a larger quantity of the ergot may be used in making a given amount of the fluidextract, so that the strength of the latter will be made sufficient. It requires no argument to show that this will increase the amount of the impurities in the fluidextract, as well as The force of this point lies in the the strength fact that none but impure ergot will fail to meet the biological test. Any ergot that is prepared, dried and stored as the Pharmacopoeia directs, and that conforms to the physical description, will invariably meet the biological test words, wherever this test fails, the ergot is unfit for use for other reasons and the more of it that is used, the greater is the proper objection to its To make my meaning more clear, I might say that if the government will rigidly enforce the physical and other requirements, all of which are legalized, the use of the biological test and the application of regulation No 30, will never be called for When these are called for, it is proof positive that the provisions of the Pharmacopoeia for purity of product have been disregarded To put it still more strongly, if that be possible, the only result of the use of Regulation No 30, with very rare exceptions, is to provide for the import and use of unfit ergot

CAUSAL FACTORS IN THE SURGICAL MORTALITY OF EXOPHTHALMIC GOITER*

By JOHN DEJ PEMBERTON, M D Division of Surgery Mayo Clinic Rochester, Minnesota

ITHIN the last decade the surgical mortality rate in exophthalmic goiter has been reduced from 5 per cent or more to approximately 0.5 per cent. This decrease is a fairly accurate gauge of the enormous progress made in the surgical treatment of Graves' disease. For a better understanding of the present status of such treatment, that is, a satisfactory conception of associated problems and an adequate appreciation of achievements at least a cursory knowledge of the history of the development is necessary. Progress has proceeded along two main lines, the perfec-

*Read before the First District Branch of the New York State Medical Society New York City October 20 1927 tion of the technic of the operation, and the control of the hyperthyroid reaction

Exophthalmic goiter was first recognized as an entity in the early part of the nineteenth century, when Parry, in 1825, published an account of eight cases. Then Graves, in 1835, and von Basedow, in 1840, described their clinical observations, and curiously it was not until the eighties that the accidental discovery was made by several observers (Tillaux, Rehn and Mikulicz) that Graves' disease could be cured by operation on the thyroid gland. At this period in the development of surgery, owing to the tremendous stimulus that had been given to it by the discovery of anesthesia and

by the teachings of Lister (1867), operation for the removal of large nodular gotters was already a well established surgical procedure Thus, Kocher, in 1884, reported a series of 250 operations for simple goiter with a mortality rate of only 24 per cent However, little was known of the physiology of the thyroid gland until the latter part of the nineteenth century In 1880 the presence of the parathyroid bodies was discovered by Sandstrom, and in 1890, Gley, and later Vassale and Generali pointed out that the parathyroid bodies functioned independently of the thyroid The standard operation consisted in the extirpation of one lobe and sometimes both lobes, and it is not, therefore, surprising that the occurrence of postoperative myxedema and tetany was comparatively common Almost coincident with Gull's description of a peculiar idiopathic condition in adults, to which Ord gave the name "myxedema", was the recognition by Kocher and Reverdin (1883) that total extirpation of the thyroid gland is followed by systemic changes, "cachexia thyroprivia" (Kocher) first they attributed this to atrophy of the According to de Quervain, Schiff and Wagner and subsequently (1884) von Bruns and Grundler, were the first to recognize that myxedema results from the loss of the function of the thyroid gland Victor Horsley produced myvedema experimentally in the monkey by the removal of the thyroid gland In 1891, Murray demonstrated that operative myxedema can be dissipated by the subcutaneous administration of thyroid extract

It was recognized early that the occurrence of myxedema and tetany was practically limited to cases in which the entire gland had been extirpated, but the reasons for this were Realizing that, in order to prenot known vent recurrence of goster, or to relieve pressure, it is sometimes necessary to operate on both lobes, Mikulicz and Kocher in 1886, in an effort to avoid the evil consequence of complete extirpation, devised a method whereby both lobes of the gland might be resected, and a portion of it in the neighborhood of the inferior thyroid artery preserved. Thus they paved the way for the development of the present standard operation

In America, under the leadership of Halsted, C H Mayo and Crile, the operation for resection of the thyroid gland soon became a safe procedure even in the hands of the less experienced Today technical accidents such as hemorrhage sepsis, and injury to the recurrent laryngeal nerve, and the operative sequelae of mysedema and tetany have been reduced to a minimum

Although the perfection of operative technic completely solved the problem in operations on goiters without hyperthyroidism, it only partially solved the problem in operations on goiter with

hyperthyroidism, for in the latter type there are additional hazards incident to the disease greater than those of faulty technic, that is, acute hyperthyroidism and the debility of the patient the result of the hyperthyroidism, or to the presence of visceral degeneration.

EXOPHTHALMIC GOITER

Formerly the most baffling and discouraging problem in the treatment of exophthalmic goiter was the frequency of postoperative hyperthyroid crisis Often within a few hours after the goiter had been resected successfully an acute explosive reaction would occur with extreme tachycardia, high fever, nausea and vomiting, restlessness, great prostration, mental stimulation, and dehrium, and frequently coma and death within from twelve to twenty-four hours. Necropsy did not reveal anatomic cause for death. As a rule the more toxic the patient's condition, the more likely the development of severe reaction, but there were no absolute criteria of the patient's condition by which the postoperative reaction could be foretold, for not infrequently it occurred when the condition was apparently only mildly No measure proved effectual in checking the progress of the reaction Fortunately it was recognized early that hope lay in prevention, and efforts were directed at means of reducing the intensity of the hyperthyroidism and of affording protection to the patient. Thus it was learned that during certain phases, when the degree of hyperthyroidism was greatest, the substitution of minor surgical procedures, such as ligation, at a diminished hazard, might so improve the patient's condition that the thyroid gland could be resected later without the risk of an acute reaction the same purpose the operation might be divided into many stages. Other means advocated for the rehabilitation of the patient included the application of roentgen rays and radium to the thyroid and thymus glands, injection into the thyroid gland of boiling water and various drugs, such as carbolic acid and iodine, and the employment of general measures of rest, high calone diet and forced fluids Likewise there were developed numerous refinements in surgical management comprising chiefly the avoidance of prolonged general anesthesia and the use of special types of anesthetics, the preoperative administration of sedatives, such as morphine and scopolamine, and the performance of the operation in bed, all designed for the protection of the patient. in earlier days a great many patients with exophthalmic goiter did not present themselves for surgical treatment until late in the course of the disease after visceral degeneration had appeared, when the operative risk was high and the pros-pect of cure diminished. This was a significant factor in retarding the surgical treatment of ex-ophthalmic goiter Two chief factors influenced the delay in operating on patients suffering from

exophthalmic goiter First, failure to diagnose the disease in its early stage The physiologic changes incident to the disease were poorly understood and in most instances the disease was not recognized until after exophthalmos had appeared and the thyroid gland had become enlarged appreciably As we know, these symptoms may or may not be present in exophthalmic goiter, or if present, they are likely to be late manifestations of the disease Second, the patient's unwillingness to submit to operation until other methods of treatment had been tried without success There were three reasons for this First, the relatively high mortality and morbid-Second, the rather high percentage of relapses due to the incompleteness of the operative procedure (lobectomy) During this period the generally accepted operation for exophthalmic goiter was resection or extirpation of one lateral lobe of the gland, tissue in the remaining lobe equivalent to several times the normal being thereby preserved That hyperthyroidism should have persisted at a reduced level in such cases was not All the patients were greatly benefited by the procedure immediately, and, curiously, many were permanently benefited, while others suffered relapse following complete remission, sometimes six or eight years afterward Third, the tendency to spontaneous remission of symptoms and cure of the disease expected that many types of treatment, each vouched for as specific, would be applied to a disease of unknown origin, the natural course of which fluctuates and at times results in symptomatic recovery, so it has been in the treatment of exophthalmic goiter, which has included rest cure, the use of specific serums or specific drugs, irradiation, injections, osteopathy, organotherapy, electrotherapy, and hydrotherapy But the tendency to spontaneous cure and remission in exophthalmic goiter is not constant, for in many cases (probably more than 60 per cent) the course of the disease is even, often mild and uninterrupted by waves of exacerbation The disease may begin in a remittent form and continue in a chronic It is obvious, therefore, that any treatment not founded on at least a partially rational basis cannot survive

With improvement of surgical measures in cases of exophthalmic goiter patients began to seek operation before the disease had wrought permanent injury. Thus one of the additional operative hazards was partially removed by the patients themselves

The reduction of the operative mortality to the low rate of from 2 to 4 per cent was a noteworthy achievement which served to establish firmly the surgical treatment of exophthalmic goiter. However, it was appreciated that on account of the failure to eliminate the hyperthyroid reactions completely and because of the obvious objections to the multiple-stage operation, the

treatment still left much to be desired. Further improvement was impossible without the close cooperation of the internist, the laboratory worker and the surgeon.

The administration of iodine (Lugol's solution) to patients with exophthalmic goiter under preparation for surgery, introduced by Plummer in 1922, has resulted in a tremendous step in the progress of surgery in this field The importance of this cannot be overemphasized, I believe history will record as the three greatest influences in the development of surgery of exophthalmic goiter, the discovery of aseptic surgery, the discovery of anesthesia, and the use of iodine in the preoperative preparation of the patient 1 shall not enter into a discussion of the theories concerning the action of iodine administered to patients with exophthalmic goiter, but shall describe briefly certain changes effected in the patient's condition and allude to their clinical significance

Surprisingly quickly after the administration of iodine to patients with exophthalmic goiter, there is a definite change in symptoms Usually the first difference realized by the patient is the loss of nervous tension with ability to relax and sleep, the eyes become less staring, although usually there is no appreciable lessening of the exophthalmos Nausea, vomiting and diarrhea, if present, often disappear within from twelve to twenty-four hours Following the improvement in appetite, there is gain in weight and strength, and within from five to seven days the pulse rate and basal metabolic rate drop, often from 30 to 40 points each. The most striking improvement is seen in patients with severe hyperthyroidism, especially if the disease is of recent origin Often patients with mild symptoms and those with moderate or relatively high hyperthyroidism with a hard "trained" goiter, usually of long duration, appear to improve only slightly after the administration of iodine Boothby reported that after the initial improvement due to iodine the patient's condition becomes stable and no further improvement occurs have since been able to confirm this by the observation of many patients who took iodine continuously for a year or more, and I believe, therefore, that there is no rational basis for administering iodine to patients with exophthalmic goiter with the expectation of curing the disease

PREOPERATIVE PREPARATION

Except as to the fundamental principles involved, there can be no standardization of the preoperative preparation of patients with exophthalmic goiter the method must be adapted to the individual patient. Obviously, the more toxic the patient's condition the greater care and time needed for preparation. Three measures are essential for all patients, iodine, rest, and a high-calorie diet. Patients with milder symptoms are given iodine, 10 minims three times a day for

from five to seven days, and are not necessarily placed in the hospital All others are in the hospital for from five days to one month or longer, depending on the condition, but they are not kept in bed continuously unless absolute rest is clearly indicated In all instances, the patient should be allowed to be up and around for several days before the operation Iodine is given in the same dosage. If the patients are admitted to the clinic in a crisis, a larger amount of iodine is given, sometimes 60 to 100 minims daily, until the crisis subsides, then 10 minims three times daily until The administration of digitalis, as a routine preoperative measure, is contraindicated, it is indicated only exceptionally for the patient with cardiac decompensation, when compensation is not restored by rest. Digitalis should not be given for at least three days before operation While I am not in a position to discuss the effect of digitalis in cases of toxic goiter, I can assert positively that operative results decidedly improved after the routine use of digitalis was discontinued Other measures are employed only as they may be definitely indicated

Proper Time for Operation

There can be no rules to regulate the time for operation in cases of exophthalmic goiter, experience must dictate However, certain considerations are fundamental For patients who are classified as bad risks, preparatory measures should be continued as long as there is definite There are two additional operimprovement ative hazards, postoperative crisis if the patient's condition is acutely toxic, and postoperative pulmonary infection if the patient is greatly debili-These two possibilities should always be borne in mind when the time to operate is being decided on As already indicated, the disappearance or marked diminution of the symptoms characteristic of exophthalmic goiter (nervous tension, restlessness, mental stimulation or depression, nausea, "stare," and so forth) is a reliable index that there will be no serious hyperthyroid reaction, provided there are no technical complications. Since the adoption in the Mayo Clinic of the present method of preparing such patients I have seen not more than four or five with severe postoperative crisis The condition of all was acutely toxic on admission and they were later accepted for operation at an increased Such reactions may be attributed either to insufficient treatment or to poor judgment in subjecting the patient to a primary complete opera-In none of the cases of mild or moderate hyperthyroidism have I seen an unexpected severe reaction, as sometimes occurred before the use of iodine. I am convinced, therefore, that with iodine preparation we are far better able to judge the status of the disease in which an explosive reaction is likely to follow operation

General debility as an additional hazard must

not be overlooked. This occurs in two distinct groups of cases In the first group the patients are debilitated as a result of a recent crisis of While the intensity of the hyperthe disease thyroidism may have subsided and the condition of the patient be definitely improved, no major surgical procedure, such as thyroidectomy, should be considered until the patient has at least partially regained his strength. If this precaution is neglected, fatal pulmonary complications are likely to ensue By prolongation of the period of preparation, practically all of the patients in this group can be operated on safely. The second and larger group is composed of cases of long duration, two years or more, where as a result visceral degenerative changes have occurred Although the number of cases in this group is still too large, fortunately there is unmistakable evidence to show that it is diminishing rapidly As shown in Table 1 there is a definite trend

TABLE 1
EXOPHTHALMIC GOITER

Year	Average duration of hyperthyroidism, months	Patients having hyperthyroidism twelve months or less		
		Cases	Per cent	
1909	31.24	88	45.36

Sept 1				

year by year for the patient with Graves' disease to seek operation sooner after the onset of the disease, this is one of the most hopeful signs in the goiter problem of today. In this group the operative risk should be recognized as potentially greater, and intensive preliminary measures should be considered Unfortunately in many instances injury is already irreparable and only slight benefit will follow any form of treatment other than resection of the thyroid gland Under these conditions the operation must be undertaken at a decidedly greater hazard Thus in the Mayo Clinic during the year 1926 there were 1,626 operations on 1,572 patients with exophthalmic goiter Thirteen patients died, a mortality rate of 083 per cent. An analysis of the records of these thirteen deaths is instructive. The average duration of symptoms of hyperthyroidism in the 1,572 patients was fifteen and ninetenths months Only one of the thirteen patients who died had had symptoms for less than fifteen months The average duration of the disease in

the remaining twelve was thirty-eight months Furthermore there were 795 patients with exophthalmic goiter who had had the disease for twelve months or less Only one died, a mortality rate of 012 per cent. The remaining 777 patients had had the disease for more than twelve Twelve of these died, a mortality rate of 15 per cent It is obvious, therefore, that the duration of the disease is a tremendously influential factor in the surgical mortality it is possible to select the groups of cases in which there will be an appreciable surgical mortality rate, one is not able to foretell which of the patients will die if subjected to operation, for not infrequently a patient whose heart apparently has been hopelessly injured will go through operation for the removal of goiter with surprising ease and later gain greatly in health In some instances improvement may be hastened and made more certain if both the superior thyroid arteries are first ligated However, the indications for this procedure have been reduced remarkably since the introduction of iodine (Table 2)

TABLE 2 Mortality January 1, 1927 to September 1, 1927

	Cases	Operations	Deaths.	cent

In advising ligation and permitting the patient to pass from direct observation, one should keep in mind the fact that always during the course of the disease there may be a certain favorable time for performing partial thyroidectomy, and if this time is allowed to pass, operation may prove to be more hazardous. There are also prove to be more hazardous cases in which two-stage thyroidectomy is a conservative and sound procedure, but the indications are limited, and its employment should not exceed 2 per cent of all thyroidectomies two-stage operation should be resorted to if the case is considered an extremely poor risk, (2) If the case is a poor or questionably poor risk, if a large firm goiter is compressing the trachea, and if resection of both lobes might result in tracheal collapse, and (3) if the case is a poor or questionably poor risk and the resection of one lobe is attended by certain technical complications, such as injury to the inferior laryngeal nerve, loss of much blood, or the excessive prolongation of the operation the two-stage procedure seems warranted, I believe that sufficient time, six weeks or more, should elapse between operations, so that the

patient can gain strength before being subjected to the second stage, otherwise it may prove disastrous. When the second operation can be done safely within a few days, it is probable that the complete operation could have been performed with less risk in one stage. The operative risk in children is relatively greater than in adults and I have often found it advisable to prolong preparatory treatment to two or three months.

OPERATIVE PROCEDURE

I shall not discuss in detail the technic of operation for exophthalmic goiter but shall mention briefly three points that I consider important for the success of surgical treatment of goiter in The first consideration is to establish the patient's confidence To cloak in mystery any part of the proposed procedure would only instill fear and doubt in the patient's mind In my experience his confidence is best gained by frankly outlining the plan, and by permitting him to mingle with other patients who have already been operated on and are enthusiastic over the result The second consideration is the anesthetic A local anesthetic is to be preferred if the cooperation of the patient can be secured If a general anesthetic is necessary it should be a supplement to the local, and the type used (nitrous oxide, ethylene, or ether) is of little consequence The experience of the anesthetist is of far greater The aim in all instances should be 1mportance the avoidance of prolonged deep anesthesia The third consideration is technical complications The most common technical complications in the surgical treatment of goiter are injury to the recurrent laryngeal nerve and postoperative hem The occurrence of either may result orrhage in the patient's death To avoid these complications requires meticulous care in technical details In the literature of recent years there have been a number of articles relating to tetany as a possible sequela of the operation of partial thy-The incidence, recognition and treatroidectomy ment of the condition have been discussed, also the frequency with which one or more of the parathyroid bodies are removed with a segment of the thyroid gland, and the operative technic for the transplantation of the parathyroid bodies as a prophylactic measure By implication these discussions would lead one to believe that tetany is a frequent and serious complication of partial thyroidectomy In my experience, however, serious tetany has not resulted postoperatively that is, symptoms have not been severe or caused any untoward effect on the patient Mild transient tetany is not present in half of 1 per cent of op-I am convinced that the severe type of tetany occurs only after radical operation in which too much of the thyroid gland is removed If an effort is made to conserve sufficient gland tissue along the posteromesial surfaces of the lobe, this complication will be avoided

Postoperative Treatment

The early postoperative care of the patient should, for the most part, be symptomatic Iodine is given as a routine. If the patient is a bad risk, it is administered in large doses, 40 to 60 minims, in the belief that it may influence the postoperative reaction. Dependence should not be placed on the heavy postoperative administration alone, as the patient may die as a result. Postoperative administration of the iodine is necessary in addition to the preoperative administration, it is not a substitute. It is given in doses of 10 minims a day for from two to three months following the operation (Table 2)

SUMMARY

The potential factors in the surgical mortality of exophthalmic goiter can be conveniently divided into three groups (1) accidents, often the result of technical error, (2) acute postoperative crises of exophthalmic goiter, and (3) the debility of the patient, most frequently the result

of long-continued hyperthyroidism By the perfection and standardization of the operative technic, surgical accidents have been reduced to a nominal figure

Formerly postoperative explosive reactions were reduced in frequency and in intensity by the employment of the multiple-stage operation. Since the introduction of iodine in the preoperative preparation of patients, both the reactions and the stage-operations have been practically eliminated.

The time element is now the most influential factor in the mortality rate in the surgery of exophthalmic goiter (0.56 per cent), as the casualties are practically confined to the group of patients who have had the disease for a year or longer. Data are conclusive that there is a definite trend for the patient with Grave's disease to come to operation earlier, this is a most hopeful sign, for obviously further improvement in the results of the surgical management is dependent on early diagnosis and treatment

THE NERVOUS CHILD

By FRANK HOWARD RICHARDSON, M D, BROOKLYN, N Y

ITTLE as the physician likes the term, and loath as he may be to permit it to be used in the hearing of his little patient, there is no doubt that he is frequently called upon to deal with what may fairly be diagnosed as "the nervous child" When used as a snap diagnosis, or with the conviction that making such a diagnosis is the end of his duty in the premises, this is unfortunate, but when taken as a challenge to the performance of one of the most difficult, as well as one of the most valuable tasks in the whole realm of medical practice, it sounds the keynote to the treatment of a clinical condition that is becoming widely prevalent today

For the purposes of this discussion, it is unnecessary to go into the old battle of heredity versus environment in the causation of the protean manifestations that grow out of what we are here calling "nervousness" Undoubtedly, some children come into the world endowed,—shall we say cursed?-with a lower "flash-point" than Equally sure is it that many perfectly well-balanced, even placid babies, become (as a result of the hectic surroundings in which Fate has placed them) highly neurotic long before they have passed beyond the confines of child-Whichever class a child belongs to, it is important to realize that heredity cannot be altered, whereas environment is always susceptible of improvement So that for the practical purpose of helping his patient, the doctor who is

called upon to treat these patients is justified in disregarding their heredity, and concentrating upon their environment

This is not to be understood as saying that heredity is unimportant, nor yet as asking the physician to blind himself to the enormous potentialities, for good or for ill, of a faulty ances-It is most valuable, especially in arriving at his diagnosis in the first place, to know all that can possibly be learned as to the family history on both sides Many a diagnosis of "nervousness" as explaining this manifestation or that, will have to be thrown out of court entirely, in view of the findings brought to light by a painstaking search of a child's family history Not only will such physical findings as lues, alcoholism, and tuberculosis alter the status of his little patient in the appraising eye of the physician Mental retardations, incipient or slight epilepsies, constitutional inferiorities, actual psychoses in their early and doubtful forms, may be suspected by a careful study of the lives of a child's forebears All of these, and many other conditions that will readily arise in the mind of the examining physician, must be sedulously ruled out, before he is justified in using the term "nervousness" What is vital to his successful coping with the problem, however, is the realization that heredity has done its worst by the time he is called in, whereas environment is always susceptible to change through his efforts

Having made sure then of what the nervous child is not,—mentally retarded, psychotic, con-

^{*}Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls, N Y, May 10 1927

stitutionally inferior, physically diseased, or simply undernourished to the degree of simulating an actual mental affection,-the doctor may well turn his attention to the consideration of the surroundings in which the child under his care finds himself placed He will find some difficulty in doing this, for the reason that the thing that vitally interests the parent or other adult who brings the youngster for treatment, is the immediate cure of some condition that has become intolerable to the elders who make up the group in which he is living What particular condition this happens to be, important as this seems to an exasperated father or an overburdened mother or a harassed teacher, is not the most important thing for discussion. It must not be allowed to lead to the commonly committed mistake of attempting to cure a result, when the underlying cause remains unaffected So surely as this is done, some other nervous manifestation is almost certain to supervene, and the last state of the unfortunate child, as well as of his long-suffering elders, is quite apt to be seven times worse than the first Just what are some of the conditions for which help is commonly sought at the hands of the doctor?

Oddly enough, though parents are prone to preface their remarks with the proud statement that "so-and-so has always been a nervous child," it is rarely or never that the nervousness per se is the cause that prompts the visit to the doctor On the contrary, it is almost invariably some manifestation of this underlying nervousness that has brought the mother to a state in which she feels she must have medical aid Frequently it is bedwetting, masturbation, thumb-sucking, nail-biting, are among the common complaints, most frequent of all, perhaps, is the familiar wail, "My child won't eat!" By no means rare is it that the condition that worries the mother is not a physical one at all She may apologize for coming to the doctor with a problem of disobedience, ungovernable anger, jealousy, tantrums, quarrelsomeness, unreasonable and unreasoning fears, palpably foolish lying, etc; confessing that she would not come to him at all, if she knew where else to turn! Tics, actual convulsions, apparent mental retardation,—these and a hundred other causes are among those for which parents seek aid he very fact that some of these may result from physical causes, and that the medical man is by his training habituated to consider first the removal of physical defects, frequently combines with the importunities of the parent to lead the doctor away from a consideration of the fundamental causative factors, without whose amenoration a true cure is quite impossible.

It would be a waste of time to enumerate here the long category of conditions in this hectic modern life of ours, that militate against the maintenance of that calm, untroubled milieu that is the birthright of every child,—a birthright so

frequently denied that we have come to recognize it as being the exception rather than the rule. The city child is of course far worse off, in this res pect, than is the country child But with the in creasing standardization of American life, the country child now has nearly as good a chance to be debauched by the printed filth of the daily press and the tabloids, and by the pictured filth of the silver screen, as has his city cousin, and the hazard of the automobile, whether that hazard be the physical one of the child in the road or the emotional one of the youngster inside the rapidly driven car, knows no geographical limitations In one respect of course the city child is hopelessly at a disadvantage,—namely, in the restricted play that so far has seemed an unavoidable concomit tant of our increasingly urban life. A child has a certain amount of physical and emotional energy stored up in his cosmos, that will find outlet If the acceptable outlet of normal play, with its use of the larger muscles and its competitive give and take, is denied, then we doctors shall not be surprised when we see this energy, transmuted into less acceptable forms, (according to the law that energy can be changed but cannot be destroyed), cropping out as nervous manifestations, or as un wholesome conduct of some other nature.

Even more potent for evil, perhaps, is the family environment of the so-called "nervous child" The old family life has not entirely gone, by any manner of means, it exists today in countless of It has gone, however, in our better homes countless other homes, and when it has once disappeared, it seems almost impossible ever to recreate it A worried, pre-occupied father, a nervous, scolding, fussy mother, critical grandparents (who in these days of congested housing conditions so frequently constitute part of the family, where in other days they would have lived under a separate rooftree), older brothers and sisters with the hectic preoccupations of so many of the growing boys and girls of today, or a younger brother or sister who may be monopolizing the signs of parental affection that should be more evenly distributed all these and countless other factors are at work in the causation of the condition of nervousness in children Some of them can be corrected, some of them are susceptible of improvement to a limited extent, some of them we must recognize as being beyond human power of betterment But recognize their existence we must, if we are to see our problem clearly, and see it whole

What then is the duty of the doctor, when he is called in to treat some or any of the manifestations listed in a previous paragraph, by elders who have presumably wrestled with their problem for some time, at first unaided, later perhaps with volunteer lay assistance? Let us remember, first of all, that the very appeal for advice puts the physician in a very strong strategic position, for whereas unsought advice is practically never

acted upon, the chances are that a parent who comes to the physician for paid services, is going at least to make some sort of attempt at following his counsel

Our first duty is, here as elsewhere, to make a diagnosis But in order to be an acceptable diagnosis, it must be somewhat different from the purely physical diagnoses to which our whole training in the medical school has predisposed us True, it must be purely physical in the negative sense of ruling out any purely physical factors and defects that might otherwise call for treat-But after this has been done, we must recognize that we are to deal not so much with physical defects as with the intangibles and imponderables of human life and social adjustments, and must convince ourselves of the fact that unless we are willing to do just this, our treatment of the overt acts which have brought the child to us, will be hopelessly inadequate and meffectual for cure Perhaps this is the most difficult part of the whole task,—the abstaining from treating the patent and obvious, and the willingness to probe for the occult and the hidden, whose correction alone will bring about a lasting cure of the whole vicious faulty condition The fact that the parent wants just such direct action, coupled with our own tendencies, is frequently sufficient to make us follow the line of least resistance. If such is the case, then we begin to prescribe restraint for thumb-sucking, nail-biting, and masturbation, limiting of fluids for enuresis, arsenic and iodide for habit spasms, and bromides or cathartics for convulsions, the correspondence course or the home tutor for speech disturbances, tonics for anorexia, and the big stick of "good old fashioned discipline" for disobedience, quarrelsomeness, tantrums, and other annoying manifestations, whose correction (?) by means of the traditionally honored method of assault and battery of the little fellow by the big fellow constitutes such a genuine relief of outraged parental feelings,-though just what it constitutes to the feelings of the one at the other end of the instrument, is perhaps not so salutory! Many of us are doing just this thing, and deluding ourselves with a pleasing belief in the efficacy of our methods, because for sooth the parents do not come back for further treatment! We are prone to overlook two important facts, in this as well as in many other phases of the practice of medicine. One is that there are other doctors and clinics in the community to which our patients may drift, when we fail to give them the relief for which they come to us The other is that, when medical aid

has been found ineffective, other agencies will almost invariably be called in

The latter constitutes a phase in the problem of the treatment of the constantly increasing volume of nervousness in children, that may well give us physicians pause. The reading public is being plentifully supplied with books, magazine articles, and lectures-in-print, on the various topics that we have been considering. They are almost always willing to give the doctor the first chance, and to stay with the old gods to the further extent of going from the general practitioner to the specialist, if the former chooses to refer them to the latter If, or when, however, they find that, little as they know about their problem, the doctors to whom they have gone in good faith seem to know less, or at least fail to impress them with the fact that they know more by devoting their whole attention to the physical side of the problem and neglecting the emotional or psychic factors then we may rest assured that they will turn elsewhere for the help that we have failed to give them And to the old quacks and cultists with whom we have learned more or less how to deal, will be added a new phalanx with whom we shall have to learn to contend with different weapons At present, the problem of the nervous child is one for us to cope with, by all the means within our power,correcting faulty family life, evil or unfortunate behavior models, and faulty habit formation, lightening the load of educational burdens, both intramural and extramural, and counseling in season and out of season a lessening of society's appalling sacrifice of child life and child health and child happiness, on the altar of industrial efficiency and adult shortsightedness let us fail in a grasp of this phase of a constantly increasing group of cases,-and we shall find set up a very powerful opposition in the form of lay psychoanalysts, consulting lay psychologists, and amateur advisers of every stripe. It is neither necessary nor desirable that we become psychiatrists, it is not only desirable but absolutely necessary that we fit ourselves to deal with conditions as they come to us, with the necessary means, whether those means are particularly to our liking, or not When the time comes that every doctor who is called upon to treat a case of nervousness in a child, will consider himself negligent of his duty until he has probed to the very bottom of the possible causes of the condition, and then done his very best to remedy the causative factors that he has found,-then and only then shall we as a profession be doing our whole duty to the nervous child

A SIMPLIFIED METHOD OF ORAL CHOLECYSTOGRAPHY—PRELIMI-NARY REPORT

By LESTER LEVYN, MD and A H ARON, MD, BUFFALO, N Y

THE first workers to introduce and advocate the oral administration of tetraiodophenolphthalein in cholecystography were Menees and Robinson in 1925. Since that time, much has been accomplished by various investigators in endeavoring to perfect this procedure.

At present a majority of Roentgenologists are utilizing the oral method and every effort therefore should be made towards standardizing the technique in order to enhance the reliability and accuracy of the method. While the results up to the present have been most encouraging, the numerous types of capsules and pills favored by different workers leave much to be desired in the way of standardization.

The administration of capsules entails many objections such as failure to break down resulting in improper absorption, gastric upsets due to irritation of the concentrated dye which often comes in contact with the stomach, and the discomfort incidental to the swallowing of a number of capsules at frequent intervals. If the dye could be given effectively in some other manner eliminating these objections, the oral method would be much simplified

Experiments with this object in view were conducted and a method devised that has given most excellent results. The following theory was elaborated, namely that the free acid of tetraiodo in a finely divided state is transformed by the duodenal contents into a soluble salt which is absorbable and will produce cholecys-

tograms

The first step, therefore, was to convert the disodium salt of tetraiodo into a freshly precipitated free acid in order that it might pass into

the duodenum in a finely divided state

By a series of experiments it was discovered that adding fruit juice to the dye precipitates the free acid and renders it available for absorption Grape juice was selected as the most suitable because its color completely disguises that of the dye, the mixture being scarcely altered in appearance from the original color The tartaric acid in the of the grape juice grape juice is more than sufficient to change the disodium salt to the free acid grams of the dye are dissolved in one ounce The resulting solution is emptied into an ordinary drinking glass which is then filled to the top with grape juice The mixture is stirred and ready for use.

In order to eliminate the time consuming factor in preparing the dye in the above manner and to obviate any difficulties patients might encounter when given the dye to prepare themselves, our next problem was to stabilize the suspension so that it could be put up in individual doses, kept indefinitely and yet form when administered a freshly precipitated free acid. The latter is absolutely essential

This was done by making an aqueons solution of the disodium salt of tetraiodo to which is added enough malic acid to exactly combine with one-half of the sodium present. It is presumed that this treatment breaks up the unstable disodium salt into the stable monoso dium salt and sodium malate thereby preventing decomposition.

Each dose of the suspension contains three grams of the dye which uniform dosage we use in all cases regardless of weight of patients. The suspension, put up in one ounce bottles, is merely added to a tumbler full of grape juice and ready for ingestion

The advantages of the tetraiodophenolphthalein suspension for oral use may be summarized as follows

- 1 The entire dose is taken at one time in a pleasant, palatable form
- 2 Best given very cold, it is well tolerated by the stomach and nausea rarely occurs
- 3 Diarrhoea is less marked than by the capsule or pill method
- 4 The tetraiodo is in suspension in a finely divided state and will not deteriorate so long as it is kept in sealed bottles
- 5 By adding fruit juice, preferable grape, a freshly precipitated free acid is formed
- 6 The free acid in this state is easily converted into the soluble salt by the alkaline duodenal contents
- 7 The free acid when given in the form of a liquid passes quickly into the duodenum because liquids following the so-called "waterway" (lesser curvature) have a tendency to leave the stomach rapidly
 - 8 Splendid cholecystograms obtained

We are indebted to the pharmaceutical laboratories of the National Aniline & Chemical Company whose close co-operation has made this work possible

ENFORCING THE MEDICAL PRACTICE ACT

Physicians are asking for concrete evidence of the enforcement of the Medical Practice Act. One item of evidence is the growing refusal of chiropractors to treat a case in the presence of a third party Another item is the great mass of detective information gathered by the State Department of Education

When the physicians of one rural section

made complaint against an illegal practitioner, they were surprised to find that the Department had taken action against a prescribing druggist and was well informed regarding a chiropractor against whom the local physicians could not get corroborative evidence. The machinery against illegal practitioners is functioning quietly and effectively

EXPERT MEDICAL TESTIMONY

The question of expert medical testimony has become acute since the operation of the Workmen's Compensation Laws and the great increase in the number of accident cases

The problem is a control of experts in giving testimony before the courts The House of Delegates of the American Medical Association at its meeting in Dallas in 1926, endorsed the principle that the courts be authorized to appoint expert witnesses, payable out of public funds, who would furnish a written report of medical conditions to the court This plan of remedying the situation seems to be the principal one that has been proposed, and in fact is almost the only legal solution that has been offered The essence of the remedy is that the court shall control the expert witness, both in his appointment and in the method in which he shall give testimony

In accordance with this resolution, Dr W Woodward, the Secretary of the Bureau of Legal Medicine and Legislation of the American Medical Association conferred with a committee of the American Bar Association, who authorized Paul Howland, Esq, of Cleveland, to cooperate with Dr Woodward in framing legislation that should conform to the principle stated in the resolution bill was accordingly drafted and published, and it immediately met with serious opposi-While the bill is excellent in theory, yet it presents certain details of method to be followed in carrying out those principles One of the chief criticisms against the proposed bill is that the judges already have power to appoint experts, and to control the method in which they shall give their tes-The object of the appointment of an expert by the court was that a qualified expert should be chosen and that his testimony should have the weight of the court's appointment behind him But a rather unexpected situation arose in that the courts of Michigan, where this provision was adopted, declared the law unconstitutional in that it violated the vested rights of a citizen, that justice shall be absolutely impartial, and that the operation of the law would not be impartial in that the testimony of the expert appointed by the judges would have greater weight than that of an expert hired by either one of the litigants The very provision of law which was expected to remedy the conditions became its main stumbling block and the cause of its rejection

This matter of expert testimony was considered by the Tri State Conference composed of representatives of the medical societies of New York, New Jersey and Pennsylvania, at its regular meeting on February 4th Mr Lloyd Paul Stryker, Counsel of the Medical

Society of the State of New York, read a paper at that conference describing the abuses of medical expert testimony and discussing the various remedies which had been proposed, practically all of which centered around the employment of an expert by the court at public expense Mr Stryker pointed out the grave defects of such a law His presentation of the case was clear and complete, and is published on page 243 of this Journal Anyone who wishes to know the principles of expert medical testimony should read that article with care.

Physicians are prone to look upon a problem from their own point of view The great mass of physicians are honest and honorable, and are actuated with a sincere desire to express scientific truth while on the witness stand But human nature is subject to faults and frailties, and the best intentioned expert may have a biased mind which unconsciously influences Moreover few physihim in his judgment cians can express themselves clearly and concisely on the written page when they have time for reflection, still less can they be clear and explicit on the witness stand in the presence of an august court and a crowd of hangers-on who are ready to give the laugh to the professional witness

Under the best of circumstances, an expert witness is at a disadvantage on the witness stand, and if he has an irritable temper, he is likely to cut a sorry figure under the cross-examinations of an opposing lawyer

On the other hand, a professional expert witness with self-assurance and a protestation of knowledge can impress one with an importance which he does not possess. A few of these so-called expert witnesses and ambulance chasers bring the whole matter of expert testimony into disrepute, and it is a question whether any amount of legislation can remedy the situation.

It was the opinion of the members of the Tri State Conference, and of Mr Stryker himself, that the problem was one of morals and ethics, and that its solution lay in inspiring medical students and physicians with a high standard of ethical conduct. This does not mean that no new laws on the subject are required, but rather that a few legal requirements are desirable, setting forth the broad principles on which a judge may act. The effect of too many details will be that a judge upholding the Egis of the law will hide behind its letter and refuse to take the responsibility for enforcing its support

The proceedings of the Tri-State Conference which are published on page 277 of this JOURNAL

form an illuminating comment on the general principles which are outlined by Mr Stryker in his article on page 243 The opinions expressed by those attending the conference may be considered to be a cross-section of the best medical thought of the three States Those wishing to inform themselves on these principles will do well to read the proceedings of the Conference as well as Mr Stryker's paper

ERGOT

The quality of ergot should be above sus-- picion, for it is one of the few drugs that is used for a specific purpose Obstetricians complain that the present fluid extract of ergot is not reliable and is not dependable in producing contractions of the muscles of the uterus and stopping hemorrhage following child-birth The reason of the mertness is suggested by Dr H H Rusby, Dean of the College of Pharmacy of Columbia University, in an article printed on page 255 of this JOURNAL

The words Russian and Spanish refer to the country in which ergot is produced Ergot comes in hard brown kernels shaped like grains of rye, an inch or more in length Each kernel is an overgrown rye seed whose tissue has been replaced by the ergot mold or fungus The kernels are obtained by sifting them from the rye after the grain has been threshed The kernels of ergot from Spain are two or three times larger than those from Russia, and are of a better quality

Dr Rusby has been an ardent advocate of the importation of only the best ergot, and in this he has the support of the medical pro-

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Proprietary Remedies - The question of proprietary remedies a quarter century ago was as acute as at present, when advertisers seek to use medical journals to advertise articles The Journal of March with trade names 1903, has this to say about prescribing readymade remedies

"Undoubtedly much of the popularity which proprietary remedies have received among some members of the profession has been entirely due to the ignorance of those physicians on the subject of pharmacology This deplorable condition of affairs may be righted in the future by the colleges giving more careful and thorough instructions in materia medica and in the compounding of drugs, but that does not offer a means of doing away at once with these undignified and unscientific means of prescribing medicine Prating of their compounds being ethical, of their frankly publishing the formulae, of their catering only to the profession, the next breath may assure you that the druggist will dispense in such a way that the patient will not know that he is not receiving a combination of drugs and which is especially compounded for his own personal The insult is increased a thousandfold when those manufacturers assume to tell us the correct doses, and the diseases in which the remedies will work wonderful cures

"The space devoted in our journals to therapeutics could well be studied by those who feel themselves so incompetent as to be forced to use proprietary medicines Would it not be well for our postgraduate schools to offer greater facilities for learning the art and science of medication and of proper prescrip-

tion writing?"

MEDICAL PROGRESS

The Origin of Chronic Pulmonary Tuberculosis -- Professor A Bacmeister refers to Ranke's three stages of tuberculosis, of which the first two are gone through in childhood, culminating in the third or chronic stage of later life, which he calls tertiary lung tuber-The first stage is that of the primary infection and the second consists of the period of sensitization and generalization These stages are not sharply marked off and Bacmeister holds that there is not such difference between child and adult tuberculosis as Ranke implies. The allergic secondary stage is characterized by exudative lesions which are sharply distinguished from the productive le-The former may sions of the third period clear up after they have been recognized clinically and by the rontgen rays, although the outcome in general is diverse and almost any of the pathological phenomena may be noted One of the most unfavorable is early cavitary formation, for, according to the author, it is an error to look upon the apex cavity as necessarily a late development The origin of the early apex infiltration is almost certainly hematogenous but the possibility of superinfection from without must not be left out of consideration, after the individual has become sensitized by the first infection. The author believes that an early apex infection which is relatively benign is nearly always the cause of chronic tuberculosis in later life This early infection is usually, as stated, free from symptoms of any kind although exceptionally there may be râles and fever Even the later adult type may run a latent course, although here the rontgenogram and sputum examination usually suffice for diagnosis To sum up the alleged advances in our knowledge the author stresses the distinction between exudative and productive lesions, the relation of early benign to later "tertiary" lesions, the fact that "early" apex infection in the adult is usually a late development and the need of sanatorium treatment in the early period to ward off later developments - Deutsche medismische Wochenschrift, December 16, 1927

A Four Day Radical Cure of Severe Morphine Addiction.—Dr H Ripke, chief of an Evangelical Hospital in Schreiberhau, writes that he had become a morphine addict as a result of sciatica in 1924, and in 1927 was using every 24 hours over four grams of muriate of morphine by intramuscular injection, in combination with large doses of hypnotics All attempts to break off ended in failure He

then tested the treatment of Dr Hubert Kahle, of Cologne, who has been at work since 1921 on a rapid and instantaneous withdrawal cure which should leave no latent desire to resume the habit Thus far the treatment has not been published and has been administered solely by its discoverer, so that there has been no corroboration from disinterested sources not, however, appear that any attempt has been made to exploit the method commercially and to some extent it is justifiable to maintain secrecy until the method has received a thor-The author mentions the Ameriough test can new remedy known as narcosan as successful in certain groups of interned prisoners, but not much is known of it by outsiders, for example we are told nothing about relapses Kahle administers the remedy himself and by It induces a twilight sleep the mouth only which keeps the patients unconscious for four or five days with the exception of a few moments daily for attention to the evacua-The patients emerge without the slightest desire for the needle although Kahle hands them a loaded syringe with permission to use The author has since his cure been engaged in active practice and is without any tendency to relapse The theory of Kahle is that withdrawal manifests itself chiefly on the sympathetic which is in a state of excitability and requires to have its tonus depressed the parasympathetic is also correspondingly disorganized and the treatment must be di-

Does Vitamin B Augment the Capacity of the Worker?-L Csik and J Bencsik of the University of Debrecen have conducted a research in reply to this question on two medical The source of the vitamin was bran with the wheat germ and dried spinach duration of the test was four and seven months Other subjects were used as conrespectively trols, while all care was taken to eliminate sug-The worker was measured with the ergograph and dynamometer, with lifting weights, The elaborate course of training to which the subjects were submitted might have been responsible for the gain in work capacity but the controls were submitted to the same regimen and evidently there was no knowledge as to the diets on the part of the subjects The authors realize

rected toward both of these systems Since

it requires at least four days to eliminate all

the morphine from the body the twilight sleep

must be maintained for that length of time.

—Deutsche medizinische Wochenschrift, Decem-

ber 9, 1927

that two subjects represent a much too small number for a final judgment. The improvement in working capacity is estimated as somewhere between 10 and 20 per cent. No theory is offered to explain how vitamin B can improve the individual in this respect, but the idea seems to have been derived from animal experiments carried out to determine the value of various fodders. The technique, however, is admittedly taken from that of Zoth and Pregl in their research on the value of testicular extract in augmenting working capacity—Khnische Wochenschrift, November, 26, 1927

Interferometric Examination of the Blood in Gestation and in Cancer—M Eiger, F Grosmann, and E Klemczynski sum up their article on this subject as follows By means of this diagnostic resource gestation can be recognized in 91 per cent of all cases and in 75 per cent of Ectopic gestation in differential early cases diagnosis has been recognized in 75 per cent of The interferometer reveals the modifications of the blood which are due to gestation from the fourth day to the fourth month post partum, for the defensive ferments form at an early period and tend to persist in the blood for a long time after delivery In tuberculous women gestation has been recognized in 91 per cent of all cases and if a tuberculous placenta was used in almost 100 per cent. The humoral diagnosis of cancer has been made in 100 per cent of all cases tested In cases of fibroma and of ovarian cyst the diagnosis leaves more to be desired The blood serum of gravid women gives positive Abderhalden reactions with a substratum of mammary gland, this reaction is not specific from the qualitative standpoint, in an absolute fashion, but may be specific from the quantitative standpoint If the women examined have annexus the serum may show cytolytic properties roward placenta and hence cause some confusion -Le Bulletin Médical, November 16-19, 1927

The Exciter of Measles —R. Decgwitz, professor of pediatrics in Greifswald University, writes a paper on this subject. He has made no attempt to isolate the particular microorganism of the disease, his studies having been made solely with infected blood of measles patients as based on the pioneer work of Hektoen in 1905 He mentions an alleged microorganism accepted by some as the true cause of the disease—the green-growing strep-tococcus of Tunnicliff and Ferry—but decides against its validity, for sterile filtrates of blood may transmit the disease The unknown organism, or other living cause, can be maintained outside the human body in dilute physiological saline solution for several weeks Inoculation succeeds, as stated, with bacteriologically sterile material and one may either sterilize the blood of the patient, dilute it, or pass is through the Berkefeld filter and still it will communicate the disease. The mucus of the nasopharynx of the measles patient in the prodromal stage may also be made to transmit the disease under the same artificial One may cultivate the virus on conditions certain special media but there must be living cells of some sort in the culture or certain indifferent bacteria The virus may be passed from culture to culture and used to inoculate susceptible subjects Certain of the lesser apes may be made to take the disease although the latter is not like typical human measles, but the fact that injection of convalescent serum will prevent the laboratory disease appears to prove that the latter is really measles -Khinische Wochenschrift, December 10, 1927

Myasthenia Gravis - Johannes M Nielsen reports three cases of myasthenia gravis, the first of which presented poorly developed musculature in general, with evidence of involvement of the bowels, history of sexual excesses, and severe psychic trauma. The second case had a history of pregnancy just completed, a very low basal metabolic rate (-36), evidence of myxedema and of vegetative inbalance with The third case involvement of the bowel presented poor musculature and evidence that practically constituted a diagnosis of syphilis of the central nervous system. All three cases had the typical onset and the typical development of myasthenia gravis and all three presented the myasthenic reaction of Jolly author makes the following observations Although sexual excesses occurred in two. myxedema in one, syphilis in one, and marked psychic trauma in one, these facts do not demonstrate causation. Myasthenia seems to occur in persons with small or flabby musculature in general When the disease develops the bowels are weakened just as is the general musculature The myasthenic reaction of Jolly is not necessarily present in all muscles at any time. It was absent during remissions in two of these cases, in the third it was not It was present only in the weakest muscles in one case Strychnine seems to have little influence on the course of the disease The basal metabolic rate is, in general, normal in myasthenia gravis. The origin of the exhaustion is probably neuromuscular -Journal of Nervous and Mental Disease, January, 1928, lxvii, 1.

Relations Between Hormones and Vitamins—E Vogt of the Gynecological Clinic, University of Tübingen, sums up an article with the above title as follows. The demonstration of a relationship between these two classes of substances is based on the following (1) Insulin and its congeners, the female sexual

hormone (folliculin), another female sexual hormone (feminin or ovoinsulin), may be prepared from sources other than the natural ones in both the plant and animal kingdoms, which substances are rich in vitamins In other words representatives of the two substances occur in nature side by side (2) The action of hormones is complex and by no means limited to certain organs Thus folliculin in addition to its hormonal activity can replace insulin in reducing the amount of blood sugar, conversely insulin can sometimes replace ovarian extract in experiment (3) The new vitamin E, known as the antisterilizing vitamin, is closely related to the ovarian hormone and the two are reciprocally dependent on each other for their activity (4) Vitaminiferous substances may be activated by rontgen rays and this is equally true of insulin (5) Both hormones and vitamins exert their proper action in very minute amounts (6) Diabetes stands close to the avitaminoses in that insulin behaves like a vitamin in a deficiency disease, and also has possible value in the other diseases which make up this group spectrum of insulin closely resembles that of irradiated ergosterin. Vitamin E and the ovarian hormone have the same boiling point and similar chemical behavior Upon this foundation it should now be possible to develop further similarities or identities between vitamins and hormones -Munchener medizinische Wochenschrift, December 16, 1927

Iodoform Treatment of Exudative Pleurisy -R Kirschenblatt and B Nasarjan of the Railway Hospital at Tiflis refer to a method originally advocated by Cohn in which iodoform was used intrapleurally with success This was in 1924 and since that period the authors have tested the treatment in 30 patients All forms of the disease were included -mfluenzal, tuberculous, neoplastic, etc but one had the disease gone on to empyema and the treatment is not designed for this condition Twenty of the cases which can be completely documented are given in tabular form, some of which were in the early stages while others had not been seen until relapse after absorption of the effusion The iodoform was prepared as a suspension or emulsion with glycerin, olive oil, and ether, one or two co being injected once or at most twice The report lacks detail and it is not clear whether the authors injected the emulsion through the intact wall or a puncture or drainage wound, although complete silence on this subject should imply that the injection was made by needle passed through the intact skin authors conclude that the Cohn treatment is superior to any in use and almost specific in its therapeutic activity The mechanism of

the good results may be due in some way to the marked febrile reaction set up by the infection which persists from 2 to 4 days, absorption of the exudate promptly following injection. In no case treated did the serous fluid become purulent, on the contrary a turbid exudate was seen to clear up. If the treatment is applied early, during the serous stage, the authors feel certain that empyema will never develop nor will resection ever be required—Munchener medizinische Wochenschrift, December 30, 1927

The Treatment of Tennis Elbow -G Percival Mills, writing in the British Medical Journal, January 7, 1928, 1, 3496, states that in making a study of combined movements in patients with tennis elbow, he frequently found that with full pronation combined with complete wrist and finger flexion the elbow would not come perfectly straight, or if it did come straight there was a distinct feeling of resistance and the process was painful This fact, together with the known frequency of cure by forcible manipulation, strongly suggested that forcing the restricted movement might bring about the desired result He found that with the wrist and fingers flexed and the forearm fully pronated, by forcing the elbow into hyperextension, and at the same time making firm pressure with the left thumb over the tender spot, which is usually just above or below the external epicondyle, a distinct click or snap could be detected. In some cases there is little more than the feeling of something giv-After this manipulation patients were relieved of their disability The procedure can be carried out without an anesthetic, but a short nitrous oxide anesthesia is prefer-A few days' rest from tennis may be indicated if the elbow is sore from the manipu-Mills points out that the whole condilation tion presents many similarities to that of a semilunar cartilage in the knee, and suggests that as the radius is necessarily very loosely attached to the orbicular ligament, it is possible that a part of this ligament may occasionally slip between the head of the radius and the capitellum

Fundus Changes in Arteriosclerosis and Nephritis and Their Significance—Writing in the Boston Medical and Surgical Journal, January 19, 1928, Walter B Lancaster describes the fundus changes seen in arteriosclerosis and nephritis under the headings "visible walls," "indentation of the veins," "rectangular crossing," "irregularity of the lumen," "copper-wire artery," "tortuosity," "silver-wire arteries," and "hemorrhages" These retinal changes he classifies into three groups (1) Those where vascular disease dominates the picture, this in-

cludes (a) arteriosclerosis (sclerosis of the retinal vessels, hemorrhages) and (b) arteriosclerotic retinitis (the same as (a) plus white (2) Those where to emia is the dominant factor, these show edema of the retina and optic nerve, hemorrhages, especially the small, round, deep-seated ones, but also the striated, superficial ones, exudates in cottonwool patches and in small spots, often arranged in star or fan-shape around the macula (3) Those in which both (1) and (2) are much in evidence Arteriosclerosis can often be detected in the retina before there is evidence of it in other parts of the body, not because it attacks the retina first but because the vessels in this region can be more readily investigated The ophthalmic findings will disclose whether vascular disease is an important factor in a given case If cotton-wool patches are present with edema and perhaps hemorrhages, a toxic factor is at work, but it cannot be said what the toxin is or that a definite type of nephritis is present, as, for example, chronic glumerular nephritis The early detection of arteriosclerosis may be made of great benefit to the patient provided it results in such modification of his habits and mode of life as will tend to arrest the progress of the disease. In referring cases with retinal changes to an internist, the ophthalmologist should make clear to him whether the retina shows vascular lesions-arteriosclerosis, with nephritis possible but not probable, or toxic lesions, with nephritis probable but not certain

The Cathode Rays in Medicine —The cathode rays, despite their role in the genesis of röntgen rays, have never themselves been used in medicine although they have been tested in various biological associations W Baensch and R. Finsterbusch, who are associated with the surgical clinic of Professor Payr of Leipzig, believe themselves the first to make a report on the therapeutic activity of these rays They have naturally begun with superficial affections and especially those in cases which are resistant to ordinary irradiation paratus for the purpose has been made possible by the labors of Pauli and of Coolidge and consists of a tube which resembles externally a simple Coolidge tube. The cathode rays are shot out of the tube through a window which consists of aluminum leaf or other metal They are never pure, being mingled to some extent with röntgen rays. The cathode rays have been known longer than the rontgen rays and have been tested over many years for bactericidal, trophic, and other powers, and only the lack of suitable apparatus has prevented their application to therapeutics. The authors first tested them in man on obstinate skin affections. It is too soon to speak of radical

cures but the authors believe they have added considerably to our resources for the treatment of certain cases of lupus, cancroid, and other obstinate skin affections. Although no untoward bad collateral results are mentioned, great care is urged, for the amount of energy involved is great and the possibility of harm is probably equal to that of the röntgen rays. Doses must be small and application tentative, for the method is in its experimental stage.—

Münchener medisinische Wochenschrift, December 23, 1927

Lymphogranuloma Inguinale With Acute Rheumatic Manifestations — Dr Alice Koppel, a dermatologist of Breslau, refers to the large number of cases of inguinal lymphogranulomatosis which have been reported since the autonomy of the new disease has been estab-In her own clinic at the All Saints Hospital 49 cases have been reported since 1925. One might speak of epidemic incidence but it is of interest to note that chancroidal buboes have become correspondingly rare Confusion with the latter is increased by the fact that some cases of lymphogranulomatosis follow small sores on the penis which in turn succeed to coitus In such cases research for the Ducrey bacillus is negative while the Frei cutaneous reaction discovered by him for lymphogranuloma is positive. This is carried out by intracutaneous injection of sterile pus and is negative for all buboes of other origin far a negative result has been obtained in 106 control patients of miscellaneous types together with 16 cases of buboes. An important subject to take up is that of a constitutional reaction Thus far such manifestations have been looked on as casual, without any constancy or special type-a little fever or headache or prostration, slight enlargement of the liver or spleen and a change in the blood formula All such records antedate the discovery of the Frei reaction and should therefore be disregarded The author has personal records in 3 patients with positive Frei test of the development of erythema nodosum, while 2 of these also showed episcleritis and 1 a condition suggesting acute rheumatic polyarthri-However, there seems to have been no response in any of these cases to antirheumatic remedies with one exception in which the immune reaction may have sensibilized the patient, or in fact may itself have been the curative factor Of the three patients two who were males presented ulcers of the frenum following coitus while the third, a female, did not present any primary lesion. The parallelism with Ducrey infection may be striking, as in a case of multiple ulcers of the vulva and anus --Klinische Wochenschrift, December 24, 1927

LEGAL

By LLOYD PAUL STRYKER, Esq Counsel, Medical Society of the State of New York

PSEUDO PREGNANCY-ETHER ANAESTHESIA-DEATH

A patient, about 28 years of age, 5 feet in height and weighing about 220 pounds, exceedingly corpulant and fatty over her entire body, on March 10th called a physician to attend her, she at that time being pregnant Upon examination he found her heart normal, her temperature 1001/2°, pulse 85 He also found a slight infection of the tonsils, for which condition medication was prescribed This physician was not to call again upon the patient unless he was sent At about 5 o'clock in the afternoon of the same day he received a call to come to the patient's home, at which time he found her in bed and she said that she was in labor. The heart was examined with a stethoscope and found normal, her pulse and temperature were normal and the tonsil infection had greatly cleared. In response to the physician's questioning, the patient stated that her menstrual period had ceased about ten months previous and that she believed herself pregnant She also stated that she had felt life during the fifth month and on different The patient was married for about occasions three and a half years and had given birth to a The patient further told seven months' stillborn the physician that she expected the birth of her child about three weeks prior to March 10th, the day when he was called to attend her, and that when the birth did not come on she had consulted another physician who, she stated, had advised her that everything would be all right, for her to return to her home and to expect the birth of her child soon It was subsequently ascertained that the patient had never consulted the physician who she stated had examined and advised her

On his visit in the afternoon of March 10th, the physician endeavored to make a digital vaginal examination to determine the presence or absence of pregnancy, but was unable to do so because of the patient's size, as the fingers would not reach the cervix He palpated the abdomen and endeavored to determine the presence of the fetal heart beat by means of the stethoscope He also tested the breasts of the patient for the From all of these tests presence of colostrum the physician was unable to determine the existence of pregnancy At this time the patient told the physician that she was having labor pains and that the pains that she was then having were similar to those that she had had at the time of the delivery of her previous child The patient was also shouting and yelling and from outward

appearances was in labor. At this time, upon completion of his examination, the physician ad vised the patient to remain in bed and that he would call on the following morning

On March 11th, at about IA M the physician was summoned to the patient's home. On ar rival he found the patient in bed, again complain ing of severe labor pains and pulling upon the sheet which had been tied to the bed She was shouting and yelling and stating that the baby The physician by palpation was kicking her examined the abdomen, but could not feel any fetal movement nor determine the presence of a He remained with the patient for about an hour and a half, during which time he made several examinations by palpating the abdomen, but was unable to determine the presence of a He left the patient, stating that he would return at about 10 o'clock of the same morning When he returned at this latter hour the patient's condition was about the same She was still complaining of labor pains, pulling on the sheet and yelling and shouting By palpation and auscultation the physician endeavored to determine the existence of pregnancy, but again was unable to do so After about a half hour he left the patient and returned again at 5 o'clock in At this time a the afternoon of March 11th vaginal examination was made by means of a From the appearance of the cervix speculum it did not appear a gravid womb, the cervix being white and hard and not red and soft and covered with mucous During the various visits to this patient her pulse and temperature were normal Upon completion of his examination on the latter visit the physician advised calling in a consultant, which advice the patient's husband acquiesced in, and another physician was called who arrived at the patient's home about 6 30 P M of March 11th

The consultant made a digital vaginal examination, also palpated the abdomen and endeavored to obtain the fetal heart sound. He was unable to reach any conclusions upon completion of his examination. This physician also examined the heart, pulse and temperature of the patient, all of which he found normal. Upon completion of the examination by the consultant the consent of the husband was obtained to the administration of an anaesthesia for the purpose of making a more extensive examination of the patient. The patient was then removed from her bed to the

dining room table The husband, at the physician's request, had procured a can of ether The attending physician acted as anaesthetist and the consultant proceeded to examine the patient after she had been anaesthetized The ether was administered by the open drop method and the attending physician taking the patient's pulse at her temple and watching her pupillary reflexes The consultant commenced his examination of the patient first by means of the speculum and then digitally and while thus engaged the patient suddenly collapsed time about an ounce and half of ether had been administered, and the attending physician did not observe any change in the pulse at this time, but the patient suddenly began to breathe heavily and her face became cyanotic The administration of the anaesthetic was immediately suspended, also any further examination of the Both physicians resorted to artificial The efforts of both physicians at respiration resuscitation was kept up for some time, but with no avail and the patient died. Only about five minutes had elapsed between the commencement of the administration of the anaesthesia and the patient's collapse

After the death of the patient and believing there may be a living fetus within the womb, the consent of the husband was procured to the performance of a Cæsarean section, which operation was performed by the consultant assisted by the attending physician Upon opening the abdomen the uterus was found to be normal and there was no evidence of pregnancy The abdominal incision was then closed by the consultant and both physicians left the patient's home. attending physician made the death certificate with ether poisoning as the cause of death death of the patient was reported to the medical examiner who performed an autopsy on the He stated in his opinion the cause of death was ether poisoning administered by attending physician to force delivery The medical examiner had been advised by the husband of the deceased that a physician had been attending his wife and a consultation was held with another physician, that both physicians stated that the deceased was pregnant and decided to deliver her, and that soon after an anaesthetic was given the deceased she died The pathological findings of the medical examiner were congestion and edema of the brain and lungs, dilated right heart and fatty change of myocardium His examination of the uterus and adnexa showed the uterus small and atrophic with no gross evidence of pregnancy and the adnexa appearing about normal After the completion of his autopsy the medical examiner questioned the cause of death as ether The brain was sent to the chemical poisoning laboratory for examination to determine the presence of ether The toxicologist reported that ether was not detectable. He further states that there is no delicate test for this substance only way of identifying it is by its physical prop-The brain may easily contain less than is possible for detection

The husband as administrator of his deceased wife, instituted a malpractice action against both of the physicians who had attended this patient, charging that they negligently failed to discover the true condition of the patient and failed to discover that she was suffering from an undue accumulation of fat and from a disease of the heart and undertook to treat the patient for pregnancy and childbirth That they negligently attempted to perform an operation upon the decedent for the supposed condition of pregnancy and administered an anaesthesia, which anaesthesia was unfit for the condition of the patient, who was subject to heart trouble and could not receive the ether anaesthesia without great danger to her life, and that by reason of the administration of the ether anaesthesia the patient's death was caused.

For several years this action was vigorously prosecuted in behalf of the plaintiff. During the pendency of the action the consulting physician died so that the action abated against him. Subsequently the plaintiff not bringing the action on for trial, a motion was made to dismiss the same for lack of prosecution, which motion was granted, thus terminating the action in favor of the surviving defendant.

NEWS NOTES

LEGISLATIVE CONFERENCE

A meeting of the Chairmen of the Legislative Committees of the County Medical Societies was held on Tuesday, February 14, in the DeWitt Clinton Hotel, Albany, N Y, beginning at 12 o'clock Harry Aranow, of Bronx County, member of the Committee on Legislation of the Medical Society of the State of New York, presided on account of the acute illness of the Chairman, Dr Henry L K Shaw A message of greeting and a bouquet of flowers was sent to Dr Shaw Luncheon was served at one o'clock, and the Conference continued in the dining room until three o'clock, when it adjourned

Several hearings on bills were scheduled for the day, among them being the Assembly Int 33, introduced by Assemblyman Vaughan, prohibiting experiments on living dogs. Drs. Simon Flexner and Frederick Sondern attended the luncheon, and afterward were present at the hearing and protested against the bill. One of the grounds of their protest was that dogs themselves would receive great benefit from discoveries made by experiments on a few individual dogs.

A list of over fifty medical bills that have been introduced in the Legislature was given to the members of the Conference, and special consideration was given to the more important ones While most of the bills dealt with minor details, one was of constructive importance,-that establishing a Medical Advisory Committee to act in association with the State Industrial Council in matters relating to the compensation of injured This proposed law has been drafted after many conferences between the Committee on Medical Economics of the Medical Society of the State of New York and representatives of the Department of Labor, and of the labor unions and other organizations interested in the care of injured workmen. The bill as planned for introduction in the Legislature is as follows

"The People of the State of New York, represented in Senate and Assembly, do enact as follows

"S 10-a of chapter fifty of the laws of nineteen hundred and twenty-one, entitled, 'An act in relation to labor, constituting chapter thirtyone of the Consolidated Laws' is hereby amended by adding a new sub-division, to be sub-division 7 to read as follows

"7 (a) As an adjunct to the Council, there shall be a State Medical Advisory Committee, consisting of five members, four of whom shall be chosen from a list of fifteen names recommended by the Medical Society of the State of

New York, and one of whom shall be chosen from a list of five names recommended by the New York Osteopathic Society. The members of such Committee shall be licensed physicians in good professional standing and they shall be appointed by the Governor, and one of them shall be designated by the Governor as Chairman The term of office of a member of such Committee shall be five years, except that the terms of the members first appointed shall expire, one on December 31, 1929, one on December 31, 1930, and one on December 31, 1931, one on December 31, 1932, and one on December 31, 1933

"(b) The members of the Committee shall be entitled to the same compensation as members of the Council They will also be paid their reasonable and necessary traveling and other expenses while engaged in the performance of their duties

"(c) The Committee shall (1) consider all matters connected with the practice of medicine submitted to it by the Commissioner, the Industrial Board or the Industrial Council, and advise them with respect thereto, (2) on its own initiative recommend to the Industrial Council such changes of administration or procedure as, after consideration, may be deemed important and necessary from the medical viewpoint, (3) consider the qualifications of applicants for, or persons being considered for, positions in the Department of Labor involving the practice of medicine, and advise the Commissioner regarding their fitness for appointment

The Medical Advisory Committee shall meet with the Council upon call of the Chairman, but the members thereof shall have no vote on matters pending before the Council Medical Advisory Committee may meet separately upon the call of its own chairman Commissioner shall designate an employee of the Department to act as Secretary to the Committee when it shall meet as a separate body Committee shall have the power to call before it and to confer with any physician or surgeon employed in the Department of Labor or any other employee with respect to medical questions It may adopt rules and regulations to cover its own proceedings and shall keep a complete record of all its proceedings. All records and other documents of the Department shall be subject to inspection by the members of the Committee

"S 2 of this bill, subdivision 6 of Section 10-a of such chapter is hereby amended to read as follows

"6 The duties and powers of the Council and of the State Medical Advisory Committee shall not extend to any matters affecting the administration of the State Insurance Fund

"S 3 This Act shall take effect July 1, 1928"

Dr W W Britt, Chairman of the Committee on Economics, explained the history of the proposed bill, and said that it was the result of many conferences extending over two years The bill was short, and was general in its provisions Its main purpose was to provide the means by which medical matters could be determined by an official body of physicians, provided the managers of the compensation work were desirous of having the assistance of the physicians attitude of the labor unions, the employing corporations, and the insurance companies was becoming increasingly favorable toward the doctors, and all the parties were glad to have means provided by which the evils of medical commercialism in settling claims could be eliminated

Senator James S Truman, of Owego, Chairman of the Senate Committee on Labor and Industry, addressed the Conference on the need that physicians should uphold the standards of their profession and help the Labor Department to cope with the few commercial doctors whose fraudulent practices have brought the great mass of physicians into disrepute with those who deal with compensation cases Senator Truman assured the physicians that the legislators wished to have the advice of the representatives of the Medical Society of the State of New York, and that the law makers were favorably impressed with the proposed bill since it was the result of conferences between representatives of all the parties concerned in the operation of the Workmen's Compensation Law

Two chiropractice bills introduced by Senator Esmond were explained by Dr Lawrence who said that since the attitude of the State Department of Education was to demand a high educational requirement from chiropractors, the cultists had not been active in pushing their interest. Moreover, when the legislators had established a legal definition of an act, such as the practice of medicine, they were extremely conservative about changing it or making exceptions for the selfish benefit of any class

The Conferees discussed Assembly man Gedney's bill, Int 102, amending section 170 of the Town Law so that a physician may collect a reasonable fee from the town when he is called by an officer to determine intoxication in an auto-driver after an accident Several doctors said that their bills for such services had been declined because of lack of authority to pay them The meeting voted to approve the bill

The Jenks bill, assembly 156, was severely criticized in that it would permit osteopaths to

perform major surgery on passing an examination in surgery given by State Board of Examiners. The intent of the bill was wrong, and its wording was so obscure that no one could tell what its scope would be

Assemblyman Caughlin's bill 426, permitting an injured workman to choose his own doctor, was approved

The Conference disapproved Assemblyman Story's bill, 480, fixing a minimum penalty of five years imprisonment for the illegal possession of narcotics. While its intent was to prevent dope peddling, yet physicians might be involved inadvertently. It was further brought out that this bill really deals with a police matter, as Dr. Carleton Simon has pointed out, and that the medical laws on the subject were already sufficient.

Assemblyman Ambro's bill, 565, was disapproved, in that it sets up the machinery for the giving of expert testimony in cases involving the criminal insane. It was felt that the courts already have sufficient power to deal with prisoners suspected of insanity (see pages 243 and 266).

The Conference opposed Assemblyman Lidzy's bill, 664, extending the time when a malpractice action may be begun, from two years, as at present, to three years. The present law groups malpractice cases with many others, and there is no reason that the time should be extended, even if the State of Maine sets a limit of twenty years within which an action for malpractice may be started.

Assemblyman Berg's bill, 684, is his former bill allowing an optometrist to use the title of doctor with the words "of optometry" following it Some optometrists can now use the title Doctor of Optometry, and others cannot The bill was opposed

The Conference opposed Assemblyman Olsen's bill, 977, permitting the use of contraceptive instruments on a married woman on her request. This bill was formally opposed by Kings County at a recent meeting

The Conference took specific action of approval or disapproval on the more important bills because the legislators are placing an increasing value on the opinions of representative physicians from every county in the State

The people are realizing that physicians are generally actuated by altruistic motives, and that they deplore commercialism and the exploitation of those afflicted with sickness. However, there is still need of eternal vigilance in opposing legislation that is detrimental to public health. The Committee on Legislation in Albany will watch the proceedings of the Legislature, but the legislative committees of the County Medical Societies are charged with the responsibility of informing their legislators regarding the bills in which physicians are interested

THE COMPENSATION CONFERENCE

Those who read the discussions on Workmen's Compensation often see references to the Industrial Survey Commission and to the Compensation Conference These two official bodies are described in a report by Dr W W Britt, Chairman of the Committee on Medical Economics of the Medical Society of the State of New York, as follows

The Industrial Survey Commission — The Industrial Survey Commission was created by the Legislature in 1926 to investigate — mercantile business—— the working people, and the extent that remedial legislation necessary may be enacted—The membership consists of Senator James S—Truman, Chairman, Assemblyman Edmund F—Cooke, Vice-Chairman, Senator John W—Gates, Senator William T—Byrne, Assemblyman William Bewley, Assemblyman Theodore L—Rogers, Assemblyman Jasper W—Cornaire, Assemblyman Frank A—Carlin, Honorable James W—Gerard, representing the general public, Merwin K—Hart, representing employers, Emanuel Koveleski, representing labor, Honorable Henry D—Sayer, Executive Secretary

The Compensation Conference—In January, 1927, the Industrial Survey Commission held a hearing to which it invited representatives of various insurance companies, self-insurers, employers, labor, New York State Society of Industrial Medicine, and the Medical Society of the State of New York—The problems of each group represented were discussed. As a result of this hearing it was unanimously decided that it would be advisable to have a committee appointed representing all factors interested, where these prob-

lems could be studied and the results transmitted

to the Industrial Survey Commission The Compensation Conference was therefore created with the following personnel

Honorable Henry D Sayer, Chairman, Executive Secretary of Industrial Survey Commission, Thomas J Curtis, First Vice-President of New York State Federation of Labor, Mark A Daly, Secretary of Associated Industries, representing industries, Att Charles Deckelman, Travelers Insurance Co, representing stock companies, Att Oliver G Browne, New York Central Lines, representing self-insurers, Att John J Train, Utica Mutual, representing mutual companies, P H Hourigan, M D, Larkin Company, representing New York State Society of Industrial Medicine, W Warren Britt, M D, Chairman Committee on Medical Economics, representing the Medical Society of the State of New York, Charles G Smith, Secretary, Manager of the State Fund

Notwithstanding that the Compensation Conference had no power conferred upon it except in an advisory capacity, it has been appealed to by the most powerful factors engaged in and affected by the Workmen's Compensation Activities These appeals have been for relief from present abuses

This has necessitated many meetings and serious consideration of these appeals. As one remedy for some of these abuses, their prevention in the future and a refinement affecting medical questions of workmen's compensation, the bill that was reported to the Legislative Conference was written by the Compensation Conference and unanimously recommended to the Industrial Survey Commission

ANNUAL GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

The New York Academy of Medicine is making arrangements for a series of lectures at the Academy, coordinated clinics, clinical demonstrations and courses in hospitals and teaching institutions of New York, on the subject of "The Problem of Aging and of Old Age"

This is to be the first "Annual Graduate Fortnight" which the Academy is arranging for the benefit of general practitioners and specialists, which will take place the first two weeks of October, beginning October 1, 1928

It is planned to have each year a subject chosen for the Annual Fortnight which is of outstanding importance in the practice of medicine and surgery and which will be approached from every available angle with the least loss of time and the greatest possible opportunity to be offered to physicians from out of town

A number of outstanding authorities will be invited to take part in the Annual Fortnight, and particular emphasis will be placed upon lectures and courses on the early recognition and preven-

tion of disturbances commonly ascribed to aging, but very often not the result of aging but its cause. Courses on functional tests of organs and systems of function such as circulation, digestion, metabolism, endocrine functions, immunity, etc., are to be offered and the relation of unrecognized forms of intoxication, chemical as well as bacteriological, to the dangers of middle age are to be specially emphasized.

The course will be open to all physicians and no fees will be charged. It is not expected that every physician will feel disposed to attend all of what will be a program of long duration each day. Special courses to be arranged in conjunction with the sessions by medical schools and teaching hospitals may, however, carry a nominal charge for those who attend them.

Sessions are scheduled for morning, afternoon, and evening, with suitable arrangements for physicians from out of the city to have supper served at the Academy between the afternoon and evening sessions

TRI-STATE CONFERENCE

The Tri-State Conference meeting of the officers of the medical societies of New York, New Jersey and Pennsylvania, was held on Saturday, February 4, 1928, in the Hotel Biltmore, New York City Dr James E Sadlier, President of the Medical Society of the State of New York presided, and the following other persons were present

From New York, Drs Trick, Booth, Fisher, Dougherty and Overton, and Mr Lloyd P Stryker, Counsel of the Society

From New Jersey, Drs Conaway, Morrison, Lathrope and Green

From Pennsylvania, Drs Albertson, Morgan and Hammond

Those present were guests of the Medical Society of the State of New York at luncheon

The topic for discussion was "Expert Medical Testimony," and was presented by Mr Llovd P Stryker His address covered every phase of the subject, and is printed on page 243 of his Journal Mr Stryker gave special consideration to the proposed law which was written in accordance with the vote of the House of Delegates of the American Medical Association in 1926, that a bill for the legal control of expert testimony should be prepared The conclusion was that the courts already had power to deal with the abuse or neglect of expert testimony, and that the remedies for unsatisfactory conditions are to be found in better morals rather than more laws While the bill proposed by the American Medical Association committee dealt with the abuses of expert testimony, so far as any law can do so, yet no law can prevent either physicians or lawyers from going the limit in evading its intent while complying with its letter

The paper was discussed by nearly every person present, and various phases of the concrete application of the principles relating to expert testimony were brought out Dr Frank Hammond Editor of Atlantic Monthly, the organ of the Medical Societies of Pennsylvania and Delaware, spoke on expert testimony in regard to physical injuries, especially that given by "Professional Experts" or those physicians who are associated with ambulancechasing lawyers The testimony of a doctor is required in every case of injury Dr Hammond said that in Philadelphia ninety per cent of lawsuits for injuries were fraudulent, and yet a few doctors appeared again and again in most of the cases Both the lawyers and the doctors were well aware of the fraudulent character of most of the claims and yet the laws were so drawn that nothing can be done to punish anyone Dr Hammond suggested a law that would allow a recovery of damage from a lawyer who pressed a fraudulent claim

One of the larger hospitals of Philadelphia had stopped the custom of permitting professional testifiers to look over the hospital records of physicians who had treated cases of injury Dr Hammond said in closing "The value of expert testimony depends on the honesty of the witness"

Dr George H Lathrope of Morristown, Chairman of the committee on Expert Testimony of the Medical Society of New Jersey, spoke first of the hypothetical question of its abuse, and said it was usually lengthy, tends to confuse the witness, encourages chicanery, is unscientific, and has no place in a court Dr Lathwhich is seeking to ascertain facts rope thought that, if possible, a better way would be that opinion testimony be given by an expert out of court, to be submitted to the jury later The feeling that every witness should be subject to cross examination would probably prevent this suggestion from being adopted

Regarding Mr Stryker's suggestion that expert testimony be mentioned in the code of ethics, Dr Lathrope said that if a man was not a gentleman, no code will make him so He also commended the action of the medical society of Leeds, England, whose members agreed not to go on the witness stand unless they could confer with the physicians on the opposing side

Dr Booth said that he had been deeply impressed with the Leeds system, and had frequently applied it in cases in which he was an expert witness. He had used the plan that each side choose a doctor and the two doctors choose a third, and that the three should investigate all the facts and go into court in agreement rather than dispute. A modification of this plan is the basis of the suggestion that the court appoint experts who should have the final say in the case, but voluntary action of the litigants was much more effective.

Dr Lathrope, also discussed the pay of experts and suggested that it be fixed by the court, but he did not expect that such a law would be enforced

The suggestion had been made that the court appoint an expert in addition to those called by the litigants, but this plan had been judged unconstitutional in Michigan where such a law had been passed. The basis of the decision was that a jury would give undue weight to the witness appointed by the court. The argument for the court's expert is just this point—that the judge would choose an expert of unquestioned ability and honesty.

The Bar Association of New Jersey and the State Medical Society had agreed on a medical

expert testimony bill two years ago, but the bill was defeated. The two organizations now propose a law permitting a court to appoint its own expert.

Dr E C Morgan, President of the Medical Society of Pennsylvania, discussed the methods judging the qualifications of an expert, and said that the judges now have the power to make such a judgment if they cared to exercise it, but there was no compulsion that judges do so

Dr Morgan also referred to the medical ethics in relation to expert testimony and suggested that ethics be emphasized in the teachings in the medical school. When the surgeon, for example, is teaching fractures, he should emphasize the ethical questions that are likely to arise. He said that Dr Hammond mentions ethical points in his surgical lectures. Speaking of the moral aspects of expert testimony, Dr Morgan said. "We have enough law now The crux of the situation is conscience."

Dr J B Morrison, Secretary of the Medical Society of New Jersey, quoted the late Judge Bartlett of the New York Court of Appeals, as saying that the way to control expert testimony was to raise the moral and ethical standards of physicians. It is unfortunate that some doctors were controlled by the desire of immediate money gain.

Dr Morrison also condemned the present method of browbeating and insulting experts on cross examination, but said that that phase of the problem is within the control of the witness. A doctor will not be annoyed by a lawyer if he keeps his head and his tongue under control

Dr Harry W Albertson, Past President of the Medical Society of Pennsylvania, suggested that a list of recognized experts be prepared by the medical societies for reference to the courts Dr Dougherty, Secretary of the Medical Society of New York, objected to this plan as impractical and leading to confusion and ill feeling

Dr Walt P Conaway, President of the Medical Society of New Jersey, said that last year the Cleveland Bar Association had conferred with the Academy of Medicine regarding the preparation of a law to give the judge power to

appoint experts He suggested a committee from the Tri-State Conference to confer with the Bar Associations of the States in drafting a law on expert testimony

Dr George M Fisher, Past President of the Medical Society of New York, called attention to the fact that most professional experts were not members of county medical societies, and so were beyond the influence of their medical brethren

Dr Harry Trick, President elect of the Medical Society of New York, spoke of the moral aspect of the question and the increasing high moral standard of students who were admitted to medical schools. This elevation of moral standards was having its effect on expert testimony and all other questions in which medical morals are involved.

Dr James E Sadlier amplified the remarks of Dr Trick and referred to the recent conference of Deans of the Medical Schools (see this Journal, February 15, pages 210 and 220)

Dr Sadlier also spoke of the excellent work of the Committee on Economics of the State Society in its meetings with representatives of the Department of Labor, and impressing the labor unions and insurance companies with the disinterested skill and unselfish moral purpose of the great majority of the medical profession. The work of this committee will go far to correct one of the great sources of abuse of expert testimony in New York State. If the professional giver of expert testimony in New York State can be controlled, expert testimony would be purged of one of its great abuses.

The conference adopted the suggestion of Dr Conaway that a representative of each State be appointed to form a committee of the Tri-State Conference to confer with representatives of the Bar Associations of the State regarding the preparation of a bill for the regulation of medical expert testimony. The committee named consists of Drs Martin B Tinker, of Ithaca, New York, H. A. Albertson, of Scranton, Pennsylvania, and Dr. J. B. Morrison of Newark, New Jersey

The next meeting of the Tri-State Conference will be held in Pennsylvania at a time and place to be set by the President of the Medical Society of Pennsylvania

INCOMPLETE DEATH CERTIFICATES

4 Communication from Toseph V De Porte Ph D Director Di ision of Vital Statistics State Department of Health Albany N 3

Year after year the State Department of Health has tried to reduce the amount of work in connection with death certificates that are not accurately filled out The results, however, are rather indifferent Each year about three thousand death certificates have to be referred back to physicians for necessary additional information If the physicians of the state would take the necessary trouble to enter the facts on the medical part of the death certificates completely, they would be spared the bother of making out supplementary blanks and the work would be reduced considerably, and also the tabulation of the Department statistical reports would be accelerated

A list of the most common reasons for supplementary inquiries is shown in the annexed table. If a doctor enters on a certificate the fact that a death was due to "accident" we are obliged to request more definite information regarding the type of accident. The word "accident" might cover any number of circumstances. The term "cancer" without a statement of the primary seat of the disease is clearly not an acceptable diagnosis. Similarly, "tuberculosis," "heart trouble," "kidney trouble," "lung trouble" are so indefinite as to be worthless for the purpose of medical statistics.

The other items in the medical part of the certificate of death, such as the date of death, the duration of the illness, the nature of the contributory cause (if any), and the place where the disease was contracted or the in-Jury sustained, should also be properly entered If the doctor has not the necessary information, then a statement to that effect would obviate the necessity of an additional inquiry, eg, if item 18b on the death certificate (where was disease contracted, etc) is left blank, we have no way of knowing whether the omission was an oversight or whether it signifies that the information was not available. If, in the latter case, the physician stated that the information was not available, the certificate would be entirely acceptable

Physicians are requested to make a special effort to fill out all the items of death certificates fully and correctly

TABLE OF UNDESIRABLE ENTRIES OF CAUSES OF DEATH

UNDESTRABLE TERMS

"Abscess," "abscess of brain," "abscess of lung" "cellulitis," "hemorrhage," etc.

"Abscess of breast," "acute nephritis," "albuminuria," "eclampsia," "embolism," "endometritis," hemorrhage," "pelvic abscess," "peritonitis," "phlebitis," "pyemia," "salpingitis," "septicemia," "thrombosis," "uremia"

"Accident," "suicide," "homicide."

"Adhesion," "obstruction," "rupture," "perforation" of intestine, stomach, gall bladder, etc

"Cancer," "cyst," "tumor," "tuberculosis"

"Complication of diseases," "dropsy," "heart failure," "natural causes," "trouble' (heart, kidney, lung), etc

"Convulsions," "edema of lungs"

"Meningitis," "cerebral meningitis," etc, "embolisni," "infection," "peritonitis," "septicemia," "thrombosis," "cerebrospinal meningitis"

"Operation"

"Pneumonia"

Suggestions for More Definite Statement of Cause of Death

Was it (1) tuberculous? (2) traumatic (if so state nature of injury)? (3) any contributory cause?

Puerperal case?

State (1) means of injury, and (2) whether accidental, suicidal, or homicidal (This information in regard to "fractures" is often omitted)

State whether automobile was involved in any kind of accident, e.g., railroad and automobile. If burns were means of injury, state if due to burning building or other cause.

State cause

State primary seat of cancer State primary seat of cyst, tumor, etc., and if malignant State organ or part affected by tuberculosis

Indefinite terms State disease

State disease causing

State disease to which term stated was contributory

Was cerebrospinal meningitis contributory to other disease or was it meningococcus meningitis? (epidemic cerebrospinal meningitis?)

State disease and organ or part affected Qualify as broncho, pieuro or lobar

Any contributory cause?

ALLEGANY COUNTY

A meeting of the Allegany County Medical Society was held at Wellsville, N Y, February 2, 1928, with president N H Fuller in the chair

Dr L C Lewis was appointed by the president, acting Secretary, during the illness of Dr C R Bowen

A report was given by Dr Leon M Kysor, Hornell, N Y, on the illness and condition of the Society's Secretary, Dr C R. Bowen, Almond, N Y

It was voted that the acting Secretary be instructed to extend to Dr Bowen the sympathy of the Society in his present illness

Dr Lloyd E Tefft, Wellsville, N Y, Dr W W Priddle, Almond, N Y and Dr Raymond O Hitchcock, Alfred, N Y, were elected members of the Society

The following scientific program was carried out

Bronchiectasis—W W Priddle, M D , Almond, N Y

Operation of the Public Relations Committee—J P Garen, M D, Olean, N Y

These papers were discussed by most of the

members present

It was voted that on account of the increased efficiency of the Allegany County Laboratory throughout the past year, the Board of Directors of the Laboratory be requested to retain Dr J P Garen, as Director of the Laboratory

It was voted that Dr A C Dean, Jamestown, N Y, be notified that if it is considered necessary to increase the membership of the Allegany County Public Health Nursing Service Committee, it is the opinion of this Society that the new members should be physicians and not laymen

A meeting of the Allegany County Medical Society was held at "The Hosleys" Belmont, N Y, October 27, 1927, with President Dr F W M Holcomb, in the chair

The election of officers resulted as follows

President—Dr N H Fuller, Friendship, N Y

Vice-President—Dr L C Lewis, Belmont,

N Y

Secretary and Treasurer—Dr C R Bowen, Almond, N Y

Censors—Drs G W Roos, H G Chamberlin, F H VanOrsdale, H R Taylor, F E Comstock and H L Hulett

The President appointed the following committees for the ensuing year

Public Health and Public Relations—Drs L. C Lewis, F E Comstock and G W Roos. Legislation—Dr H E Cooley, Wellsville, N Y

Membership—Drs L S Benedict, H G Chamberlin, C W O'Donnell and B J Wakely

The following papers were given in the scientific program

Neuro-Surgery—Winfield Ney, MD, New York City

Activities of the State Public Health and Public Relations—C J Longstreet, MD, Binghamton, N Y

Sciatica—Virgil C Kinney, MD, Wellsville, NY

These papers were discussed by most of the members present

LYMAN C LEWIS, M.D,

Acting Secretary

JEFFERSON COUNTY

The meeting of The Medical Society of Jefferson County was held February 9th, 1928, at the Black River Valley Club, Watertown, N Y, with 44 members present

Dinner was served at 6 30 after which Dr Edward C Reifenstein, Professor of Medicine at Syracuse University addressed the meeting on "Periodic Health Examinations" He discussed at length the advantages and disadvantages pointing out the importance of personal contact, and expressed himself as opposed to commercialized periodic health examinations, and advised against going ahead too rapidly with a general program of public health examinations. He then examined a patient, demonstrating a periodic health examination.

The committee in charge of the arrangements for a new county contagious hospital

reported that favorable progress was being made, and that the hospital was practically assured

Five members who had been dropped for non-payment of dues by the State Society fulfilled the requirements and were duly reinstated Dr H G Dawson of Cape Vincent was also elected a member of the Society

A resolution was passed to the effect that the Jefferson County Medical Society is well satisfied with the present boundary of the fifth district branch

Dr Albert L Morgan of Dexter, who is no longer able to attend meetings of the Society on account of poor health, and who asked to be dropped from the Society, was unanimously elected an honorary member of the Society

WALTER S ATKINSON, MD, Secretary

ULSTER COUNTY

The Ulster County Medical Society held its regular meeting at the Governor Clinton Hotel with twenty-two per cent of its membership present, although the night was exceedingly stormy and slippery

The Ulster County Medical Society indorsed the efforts of the Junior Aid League to reduce infant mortality of our city (Kingston), and also to extend their work to include prenatal

instruction and care

A delegate is to be sent to the meeting of the National Tuberculosis Association in New York City and this Society will give its full cooperation in the National Drive in March against tuberculosis A motion was made, seconded and carried indorsing the action of the Cattaraugus County Medical Society in opposing the Milbank-State Charities Aid drive in that county

A motion was made, seconded and carried indorsing the action of Kings County Medical Society in opposing bills legalizing Sterilization and Birth Control

After the business session the scientific program consisted of a short paper on 'Diagnosis and Treatment of Osteomyelitis in Children" by Dr Wm T Doran of Bellevue Hospital Following the meeting refreshments were served

F H Voss, M D. Secretary

COUNTY SOCIETY BREVITIES

During January, fifty-three new members were reported by fifteen County Societies and seven were reinstated, making a total of sixty additions to the membership of the State Society During the same month four resignations were reported by physicians moving to other locations

More than one hundred members of the Parent-Teacher organizations of Broome County are engaged in a toxin-antitoxin survey of Binghamton this week, under the direction and auspices of the Broome County Medical Society, to ascertain whether the scope of diphtheria prevention work already done is a basis upon which to build a program for the continuation of the work Dr C J Longstreet, chairman of the Public Health Committee of the Medical Society, is directing the work.

In response to the request of the Parent-Teacher Association of Batavia and the recommendation of the board of health, the common council has appropriated \$500 for the payment of physicians' fees in connection with the anti-diphtheria campaign which is being waged in

that city

In Orange County, the Parent-Teacher Association, in conjunction with the public health nurse, assisted with an anti-diphtheria clinic conducted by the health officer at a school house in Vails Gate, on January 27th

The Albany County Medical Society proposes to hold a series of monthly meetings at the hospitals of the city. The program was initiated at a meeting on February 8th at the Homeopathic Hospital. The scientific program was furnished by members of the staff. Following the scientific meeting, the hospital entertained the physicians with a light supper

The Herkimer County Medical Society has appointed a committee to consist of one physician from each hospital staff of the three gen-

eral hospitals in the county, together with the President of County Society, to consider matters of "management, ethics and care of pa-tients" The function of the committee is to make a careful study of the activities of the several hospitals and the conditions under which they are conducted, and do what it can to promote harmonious cooperation among them, as well as among the physicians of their staffs and the physicians of the county committee will meet in turn with the executive committees of the boards of managers of the several hospitals The first meeting will be held in February with the board of managers of the Herkimer Memorial Hospital In March the committee will meet with the board of managers of the Ilion Hospital, and in April with the board of managers of the Little Falls Hospital.

The Queens County Medical Society recently made an inquiry among its members as to what subjects were favored for post-graduate lectures during the coming year "58% showed a preference for topics on medical subjects, obstetrics came next, with 14%, while pediatrics was third, with 12% The rest were as follows Surgery, 11%, genecology, 8%, cardiac diseases, 7%, therapeutics, 6%, diagnosis, 4%, neuralgia, 4% (From Bulletin of Medical Society of the County of Queens) That lectures on medical subjects should be five times as much in demand as lectures on surgical subjects, is very interesting

The Cortland County Society, at a special meeting on Friday, January 20th, authorized its president to appoint a committee to go before the board of supervisors with the proposition that a county health unit be organized. The committee named by Dr. Wattenberg includes Dr. D. R. Reilly, as chairman, Dr. A. A. Bailey and Dr. C. E. Chapin.

MEDICAL WARES

DIATHERMIA MACHINES

Diathermia is the application of heat to the tissues of a limited part of the body, usually those lying deep in the body

The effects of diatheria are produced by a current of electricity passing between two electrodes, yet it is not an electrical treatment, for its object is the heat that is generated by the current that passes through the tissues when all the other effects of the current are eliminated so far as possible

When an ordinary current of only a few milliamperes of electricity passes through the body, it causes pain and muscular contractions, and burns the skin, and causes other undesirable effects But one or two thousand milliamperes of the high frequency current used in diathermia can pass through the tissues without causing discomfort or producing other ill effects, for the nerves, and muscles, and other living tissues of the body, do not respond to electrical oscillations or alternations which occur one hundred thousand or more times per Diathermia, as practically applied to the body, requires an alternating current which oscillates from five hundred thousand to one million times per second, hence the name, high frequency, is given to the current. Its voltage is from five thousand to twenty-five thousand, which is only about one-tenth of that used in X-ray machines

The basic facts regarding high frequency currents were discovered by Arsene d'Arsonval, French physicist, in 1888, and those currents are commonly known by his name. A special form of the current having an especially high frequency and voltage and requiring only one wire, is called the Oudin current So far as is known, the first practical diathermia machine made in America was produced by Wappler about 1903

The broad principles of the production of a high frequency current are not difficult to understand, although their full explanation would require volumes of description and the application of higher mathematics The high frequency of the current used in diathermia is obtained by the use of primary and secondary coils, and condensers such as Leyden jars The discharge from a condenser is not a single spark, but is an extremely rapid oscillation to and fro like the vibrations of a tuning fork, which persist after the original impulse Each of the 60 cycles, or 120 alternations, of the ordinary primary current sets up thousands of oscillations of the condenser discharge

oscillating current is that which is passed through the tissues during a diathermia treatment. The operator can vary its intensity and volume by a control of the primary current and the spacing of the spark gaps.

The oscillations of electricity across a spark gap may be illustrated by supposing two deep jars to be connected at the bases by a large tube. If one jar is full of water and the other is empty, and the connecting tube is suddenly opened, the water will surge back and forth between the two jars in waves of diminishing heights until it comes to rest with each jar half full. In the same manner, electricity will oscillate across a spark-gap in a wire connecting the two poles of a coil

One test of a diathermia machine is its power to light incandescent lamps introduced in the oscillating circuit. A therapeutic current will light from one to four 50 Watt lamps such as are ordinarily used in lighting houses. This amount of current would be deadly if its alternations did not occur several hundred thousand times per second.

Diathermia is used both medically and surgically. The medical effects are those of diffused heat generated between large flat electrodes applied to the skin. The maximum current that the skin will endure without harm is 100 milliamperes for each square inch of the smaller of the two electrode surfaces. Disthermia applied for twenty minutes will heat the tissues between the electrodes three or four degrees.

The surgical effects of diathermia currents consist of coagulation, and disintegration or cutting of the tissues. They occur when the current is concentrated in a needle which is used in place of one of the broad electrodes used in medical treatments. The effect of the disintegrating or cutting current is not due to a burning or cauterization, although a slight amount of scorching occurs owing to an arcing of the current in contact with the flesh. The effects are those of molecular disintegration and occur at a critical point at which the alternations are about 600,000 per second.

Almost the only use of the Oudin, or monopolar current is its application to warts and similar growths which it destroys by a process of desiccation

A modern diathermia machine is an instrument of precision, and in the hands of a skillful operator its current may be exactly controlled in its dosage and effects

THE DAILY PRESS

PHYSICAL MATTER

Disputations and theories in theology are not so very different from those in the physical world. Both are concerned with the origin and nature of matter, and famous authorities among both theologians and scientists assert that the matter is something impalpable, such, as thought or vibration. The subject was discussed by Dr. Clyde Snook in a meeting of the New York Electrical Society on January 27, and repoted in the New York Times of January 28, as follows

"The 1928 atom is not a planetary system, consisting of a central nucleus like the sun and a system of whirling satellites like the earth, Mars, Jupiter and the others, but is a group of whirling waves consisting of nobody

knows what

"The 1927 model of the atom, which was the Bohr atom with modifications, consisted of a positive particle of electricity with a series of negative particles circling around it. All matter was built up last year of these minute electrical storms. But this year this is all passe The 1928 atom, according to Dr. Snook, is a sort of cyclone of ether waves or something equally effective.

Dr Snook also demonstrated molecular and

atomic sounds which he described as follows, according to the newspaper account of the New York Times

"Minute movements of molecules under electromagnetic changes were multiplied 14,000,000 times and roared at the audience by the Westinghouse loud speaker

"First, there was an enormously exaggerated frying sound This was the Schrot effect, it was explained The Schrot effect is the sound of electrons escaping from heated filaments. They come out sporadically and the sound is reproduced as a sputtering

"Next the loud speaker gave the Johnson effect, which was the sound of electrons in collision with atoms as they moved through a heated conductor. This effect is named after the discoverer, J. B. Johnson of the Bell Laboratories."

"The loud speaker then roared with the Barkhaused effect. This was the 14,000,000-times-magnified sound of atoms turning over in a bar of iron as a magnet was passed close to it."

This sounds very much like the music of the spheres described by poets and the Psalmist

DIAGNOSTIC EARTHQUAKES

The seismographs in observatories throughout the world recorded violent rumblings and tremors of the foundations of the earth, leading students of terrestrial pathology to expect reports of dire disaster in Alaska where the disturbing rales were located, but the visible damage seems to have been confined to the telegraphic cables. The New York Herald-Tribune of October 26th commenting editorially on the interpretation of seismographic records savs

"Earthquakes are among the greatest helps of the geologist. They form almost the only instrument with which he can examine the interior of our terrestrial ball. An experienced greengrocer can tap his finger on a cantaloupe and tell something—although, alas! not everything—about the melon's interior. An experienced physician performs similarly with one's ailing liver. To diagnosticians of the earth's insides an earthquake brings similar opportunity, for the passage of the earthquake shock usually tells much of what that substance is like. The earth shocks which originate at

great depths, as Monday's Alaskan quake seems to have done, are likely to be exceptionally instructive about what lies close to the earth's heart. The world-wide records of that quiver will be scanned with interest, once they have been collected, by the experts in terrestrial diagnosis."

The popular notion of an earthquake is that a titan shakes the earth as if it were a sieve in the center of which a yawning crack appears engulfing man and houses. This idea was made vivid to school children a generation ago by a picture of the classic Lisbon earthquake of 1755 showing people and houses tumbling into a long chasm. The same idea was expressed by the poem, "The Wonderful One Hoss Shay" in which Dr. Holmes says

"That was the day when Lisbon town Saw the earth open and gulp her down"

But seismographs show that the earth is almost as full of tremors as a normal chest is of rales, and that nearly all the disturbances are within the limits of terrestrial health and safety

Almost the only use of the Oudin, or monopolar current is its application to warts and similar growths which it destroys by a process of desiccation

A modern diatherinia machine is an instrument of precision, and in the hands of a skillful operator its current may be exactly controlled in its dosage and effects

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review as dictated by their merits, or in the interests of our readers.

- Special Dental Pathology A Treatise for Students and for Practitioners of Dentistry and Medicine. By Julio Endelman, M.S., D.D.S. 2nd Edition Octavo of 444 pages, with 371 illustrations. St. Louis, The C. V. Mosby Company, 1927. Cloth \$7.00
- DISEASES OF THE MOUTH By STERLING V MEAD, DDS Octavo of 578 pages, with 274 illustrations St. Louis, The C V Mosby Company, 1927 Cloth, \$1000
- AN INTRODUCTION TO CLINICAL PERIMETRY By H M TRAQUAIR, M D Quarto of 264 pages, with 164 illustrations St. Louis, C V Mosby Company, 1927 Cloth, \$13 50
- SURGICAL CLINICS OF NORTH AMERICA. Vol vii, No 5 October, 1927 (Pacific Coast Surgical Association Number, Dedicated to the memory of Lord Lister on the Centennial of His Birth) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.
- PRACTICAL GUIDE TO DISEASES OF THE I HROAT, Nose AND EAR. For Senior Students and Junior Practitioners By WILLIAM LAMB, M.D. Revised by Frederick W. Sydenham, M.D. Fifth Edition 12mo of 450 pages, illustrated. New York, William Wood and Company, 1927 Cloth, \$450
- A Synopsis of Physiology By A. Rendle Short, M D and C. I Ham, M B, Ch B 12mo of 258 pages, illustrated with diagrams New York, William Wood and Company, 1927 Cloth, \$3.50
- HANDBOOK FOR THE MEDICAL SOLDIER OF THE REGULAR ARMY, NATIONAL GUARD, ORGANIZED RESERVES, AND ENLISTED RESERVE CORPS OF THE ARMY OF THE UNITED STATES BY ARNOLD DWIGHT TUTTLE. Approved by the Surgeon General of the Army 12mo of 691 pages, illustrated New York, William Wood and Company, 1927 Flexible leather, \$500
- Pyelography Its History, Technique, Uses and Dangers By Alex E Roche, M.A., M.D. Octavo of 118 pages, illustrated. New York, William Wood and Company, 1927 Cloth, \$3.50
- Exposures of Long Bones and Other Surgical Methods By Arnold K. Henry, M.C., B.Ch. Octavo of 80 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$3 50
- Pulmonary Tuberculosis Its Etiology and Treatment. A Record of Twenty-seven Years' Observation and Work in Open-Air Sanatoria. By David C. Muthu, M.D. Second Edition, enlarged. Octavo of 381 pages, illustrated. New York, William Wood and Company, 1927. Cloth, \$5.00
- A HANDBOOK OF OPHTHALMOLOGY BY HUMPHREY NEAME, FR.C.S and F. A. WILLIAMSON-NOBLE, FR.C.S. Octavo of 312 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$400
- MAX 100 PETTENKOFER His Theory of the Etiology of Cholera, Typhoid Fever and other Intestinal Diseases A Review of his Arguments and Evidence. By Edgar Erski's Hume, MD 12mo of 142 pages, with photographs New York, Paul B Hoeber, Inc., 1927 Cloth, \$1 50

- X-RAIS AND RADIUM IN THE TREATMENT OF DISEASES OF THE SKIN BY GEORGE M MACKEE, MD Second Edition, revised. Octavo of 788 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$1000
- A TEXT-BOOK OF PRACTICAL THERAPEUTICS with Especial Reference to the Application of Remedial Measures to Disease and their Employment upon a Rational Basis By Hobart Amory Hare, B Sc., M.D. Twentieth Edition, revised Octavo of 1094 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$750
- The Entra-Oct Lar Muscles A Clinical Study of Normal and Abnormal Ocular Mothly By Luther C Peter, AM, MD Octavo of 294 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$400
- Polionyelitis with Especial Reference to the Treatment By W RUSSELL MACAUSLAND M.D. Octavo of 402 pages, illustrated Philadelphia, Lea and Febiger, 1927 Cloth, \$550
- INTERNATIONAL CLINICS Edited by HENRY W CATTELL, A.V., M.D. Thirty-seventh Series, Volume IV Octavo of 309 pages, with illustrations Philadelphia and London, J. B. Lippincott Company 1927
- RADIUM IN GYNECOLOGY By JOHN G CLARK, M D, and CHARLES C NORRIS, M D With a chapter on Physics by Gioacchino Failla E.E., M.A., D Sc Octavo of 315 pages, illustrated Philadelphia and London, J B Lippincott Company, 1927 Cloth, \$800
- Nerve Tracts of the Brain and Cord Anatomy—Physiology—Applied Neurology By William Keiller, F.R.C.S., Ed Large octavo of 456 pages, illustrated New York, The Macmillan Company, 1927 Cloth, \$800
- PLASTIC SURGERY OF THE ORBIT By J EASTMAN SHEE-HAN, M D Large octavo of 348 pages, with illustrations New York, The Macmillan Company, 1927 Cloth, \$1200
- LE METABOLISME BASAL. Ses Applications en Clinique. By CLAUDE GAUTIER and RENÉ WOLFF 16mo of 172 pages Paris, Gaston Doin & Cie, 1928 Paper, 15 francs
- THE CURRENT SIGNIFICANCE OF THE WORD ALUM BY WILLIAM D RICHARDSON 12mo of 93 pages Chrcago, The Commonwealth Press, 1927 Cloth, \$1 00
- THE PREVENTION OF PREVENTABLE ORTHOPEDIC DEFECTS, WITH SPECIAL REFERENCE TO THE SPINE AND THE FEET BY S C WOLDENBERG, B Sc., M D Octavo of 120 pages, illustrated St. Paul, Minneapolis, Bruce Publishing Company, 1927 Cloth, \$200
- Annual Report of the Surgeon General of the Public Health Service of the United States For the Fiscal Year 1927 Octavo of 355 pages Washington, United States Government Printing Office, 1927
- NOUVEAU TRAITE DE MEDECINE. By G H ROGER FERNAND WIDAL and P J TEISSTER, Fasc XXI Pathologie du Système Nerveux Octavo of 900 pages, illustrated Paris, Masson et Cie, 1927 Cloth, 85 francs

POETIC FACTS

The temptation is strong to philosophize on the following verses by James J Montague reprinted from the New York Herald Tribune

of January 18, but the Journal will leave that gratification to the individual readers of this Department

DRAGONS

I do not hold with cheery rhymes
Which chant the praise of modern times,
Our buildings are more spacious than
The caves of prehistoric man,
Our Western plains can grow more wheat
Than palæolithic man could eat
I own that we've progressed a lot,
But have we dragons? We have not!
No elephant, no gun, no whale,
No snake, however long of tail,
No lion, tiger, ostrich, bear,
With this vast creature can compare
A dragon at a single chew

Could devastate our greatest zoo,
He could, with one prodigious blow,
Knock ten skyscrapers for a row,
And stroll around and scorch to death
A city with his fiery breath
One glance at his forbidding face
Would terrify a populace
The world is still a fairish home
For us who o'er its surface roam,
But while perhaps we don't regret
That dragons aren't around here yet,
It must have been far more sublime
Way back in bold St George's time.

Inspiration is a coy goddess and no one can foretell where she will lead. After the poet had drawn on his imagination, he turned to

prosaic facts and wrote the following scientific poem which appeared in the New York Herold Tribune of February 4th

THE SNAKE

The snake has neither legs nor arms, He's wholly destitute of charms
Which in so many beasts suffice
To make us fancy they are nice
When he proceeds from spot to spot
He cannot walk or fly or trot,
But crawls through vale and over hummock
Upon his long and scaly stomach,
Which is a method of progressing
That you and I would find distressing
He has to forage everywhere
To find a daily bill of fare

And search about with hungry eyes For gophers, mice, and rats and flies A dietary which, I'll state, One can't regard as delicate And so, if every now and then The snake grows envious of men And bites 'em when they interfere With his apodical career, We ought to think what we would do If we were humble serpents, too Were we both legless, scaled and slim I'm sure we should behave like him

BIRTH CONTROL

Dr S Parkes Cadman was asked the following question in the New York Herald Tribune of January 28

"Is it not true that the birth rate of nations is affected by their death rate and rises or falls with the latter? If so, what need is there for artificial methods of birth control?"

His answer was as follows

"Vital statistics show that a decline in fertility follows a course decided by the same combination of causes which creates a decline in the death rate. Since the last quarter of the nineteenth century sweeping reforms in personal and public hygiene have produced a decrease in both births and deaths in non-Christian as well as Christian lands. "Moreover, this fall in the birth rate is intiated by the fall in the death rate among unsophisticated peoples who know nothing of birth control propaganda or the use of confraceptives. The birth rate in Bengal, India, a province innocent of these devices, has declined 25 per cent in the past two decades.

"It is contended that under the same natural process the United States could have excluded all foreign immigration for fifty years past and her population would probably have attained its present proportions. Social and economic necessities enlarge as well as reduce the size of families. These fluctuations sustain your statement that nature exercises an inherent control over the general situation which does not seem to require artificial measures."

CLINICAL DIAGNOSIS BY LABORATORY METHODS A WORKing Manual of Clinical Pathology By James Campbell Todd, Ph B, M D and Arthur Hawley Sanford, A M., M D, 6th Edition, revised Octavo of 748 pages, with 346 illustrations Philadelphia and London don, W B Saunders Company, 1927 Cloth, \$600

Among the numerous volumes, large and small, purporting to describe laboratory methods completely, in a concise, accurate and modern manner, Todd and Sandford's Clinical Diagnosis by Laboratory Methods, in our opinion is by far the best. The theoretical aspect of the subject is relegated to a position of minor importance, actual descriptions, to the minutest details being clearly depicted. Numerous illustrations, reinforced by adequate legends are placed in advantageous relation to the text. All in all, as a handy reference book to the clinical pathologist and his technicians it has no peer

MAY LEDERER.

RECENT ADVANCES IN BIOCHEMISTRY By JOHN PRYDE, B Sc., M Sc. Octavo of 348 pages, with 38 illustra-tions Philadelphia, P Blakiston's Son & Company, Cloth, \$3.50

This book was written for those who wish to bring their knowledge of biochemistry up to date. Among the subjects treated are Protein catabolism, urea, the physical chemistry of proteins, the structure of nucleoproteins, carbohydrates, fats, phosphorus and sulphur compounds, vitamines, hemoglobin, the chemistry of immunity, and chemotherapy. Only the important recent work is described, as the reader is assumed to have a knowledge of the fundamentals. The author's discussion is at once interesting clear, and adequate. The free use of structural formulas and charts adds greatly to the value of the text. Each chapter is followed by a hibliography A. H EGGERTH

By W H C THE SCIENCE AND PRACTICE OF SURGERY ROMANIS, M.A., M.D., and PHILIP H MITCHINER, M.D. Two Volumes Vol 1—General Surgery Octavo of 795 pages, with 666 illustrations Vol. 2—Regional Surgery Octavo of 955 pages, with 666 illustrations New York, William Wood and Company 1077 Clark \$12.00 pany, 1927 Cloth, \$12 00

The aim of this work, as stated by the authors, is primarily to place before the student a book that is sufficiently comprehensive to provide him with all that he will require in passing his ordinary surgical examina-tions, or any higher examinations to which he may aspire, and secondly to present a book that may be of value as a work of reference to the medical practitioner

In the fourteen-hundred pages of reading one notes the essentials of anatomy, clinical and physical findings and the treatment of surgical diseases, as well as sufficient illustrations to clarify obscure points or methods

described.

One notes some variance from the more commonly accepted methods of many American surgeons, a fact that should not be unexpected in a work from surgeons of another country even though in the main surgical methods have become so simplified and so generally known that one could almost say they were standardized, were it not for the fact that the latter term is held in disrepute because of its benumbing effect upon individual

thought and original ideas
But "Shades" of McBurney! How that illustrious
surgeon of hallowed fame would protest, could he but make his voice reach this mundane land, at the statement that "the McBurney incision is now quite out of date, and its use marks a total lack of surgical balance." A broad inquiry would easily show a not limited use of this method of entrance to the right abdomen in selected cases by many surgeons of no mean balance and repute

For quick and ready reference these two volumes will fill a valuable place, and will be found to contain the fundamentals and essentials of the knowledge of surgery, and prove a valued addition to the library of the general practitioner as well as the surgeon.

ROGER DURHAM

TREATMENT OF VENERAL DISEASE IN GENERAL PRACTICE. By E T BURKE, DSO, MB 12mo of 162 pages, illustrated New York, Oxford University Press, 1927 Cloth, \$1.75

This little book contains much of value to the general practitioner and should meet with a ready demand.

The author laments the fact that, in many books on this subject, there is a lack of detail and a vagueness when it comes to the treatment. It is this fact that has stimulated the writing of the book. Many old-fashioned ideas are criticised and replaced by those which are strictly up-to-date.

He takes occasion to censure the English physicians for so frequently using other European pharmaceuticals

when equally good ones are obtainable at home.

He considers bismuth far more effective as an antiluetic than mercury, in fact, he has not used any of the latter for the past two years. Valid reasons for this are given Burke expresses the relative value of the Arsenic, 10, Bismuth, antisyphilitic triad as follows 8, Mercury, 3 Mercury is never employed excepting when bismuth is either not tolerated or unobtainable. Bismuth is given in separate courses from salvarsan for the expressed reason that, when both are given together, the spirocheta may become more resistant.

In gonorrhea, vaccines are used in all stages Many readers will not agree with the author's method of injecting the urethra and bladder per catheter for the treatment of acute posterior urethritis

Much praise is given to the treatment of arthritis with

intravenous injections of electrargol

In cerebro-spinal lues, the author has obtained best results with intravenous therapy plus spinal drainage,

A sound knowledge of venereal disease is displayed by a practical clinician of wide experience,

Augustus Harris

HEALTHY GROWTH A Study of the Relation between the Mental and Physical Development of Adolescent Boys in a Public Day School. By ALFRED A MUNIFORD, M.D. Octavo of 348 pages, illustrated London and New York, Oxford University Press, 1927 Cloth,

\$500 (Oxford Medical Publications.)
This book is based upon the observations made on boys in the Manchester Grammar School in England. Some of the best work in this country on nutrition has been done in private schools, the advantage in such cases being the close and constant supervision of the children Dr Mumford's book is one of the most scientific in

character that has appeared on this subject

Not only are there records of all of the ordinary tests and measurements, but there are also recorded the results of several unusual indices. These tests are the Buovancy or the Specific Gravity. Tests, Loss of Moisture By Hand as an Index of Heat Elimination, and The Measurement of Fatigue in School Life. In addi-tion to the work done at the Manchester Grammar School, there are recorded the results of observations made at the Greengate Hospital and Open Air School for Physically Defective Children, which show the beneficial effects of the open air schools for the undernourished child WM HENRY DONNELLY

LINICAL CASE-TAKING Supplement to Methods in Medicine By George R. Herrmann, M.D. Octavo of 90 pages The C. V. Mosby Company, 1927 Cloth, \$1.50 CLINICAL CASE-TAKING

This volume of ninety pages is a valuable addition to the author's publication, "Methods in Medicine," as it embodies the constructive criticisms made in reviews of the "Methods in Medicine." These suggestions have been noted and more detailed facts of history-taking have been presented. No laboratory methods are given as these are well presented in the original volume, but many details of diseased conditions are presented and, by following the data given, our histories will be much more complete and useful. These two volumes by the author should be used by every physician who would be up to date HENRY M MOSES

BOOK REVIEWS

PRACTICE OF UROLOGY AND SYPHILOLOGY A Surgical Treatise on Genito-Urinary Diseases and Syphilis By CHARLES H CHETWOOD, M D 4th Edition. Octavo of 879 pages, illustrated. New York, William Wood and Cloth, \$9 00 Company, 1927

In the present 4th edition of this well known and deservedly popular book for students and practitioners, the author has brought the subjects of Genito-Urinary diseases and Syphilis completely up to date.

His chapter on Gonorrhea is practical and after considering the older methods of treatment of the disease,

he also takes up the use of acriflavine

The treatment of the whole subject of Stricture is excellent as might be expected from a pupil and former assistant of the elder Dr Keyes, who with Van Buren and Otis helped to make urology in this country

The correct methods of the preliminary and after treatment of prostatectomy may be read with profit by the general surgeon who occasionally takes a chance with some poor old man's prostate and life.

The chapter on the kidney and its operations is particularly well written and contains the more recent facts in regard to its acute infections and their cures

Syphilis is adequately considered with illustrations showing typical lesions, and the modern views as to its treatment with mercury and iodine and the salvarsans, both old and new, and silver with bismuth, and even the very new and important discovery of malaria as a therapeutic agent.

The treatment of Nervous Syphilis by spinal injections

are all fully considered

All the illustrations in the book are well selected and well executed and demonstrate fully conditions described.

A useful feature and one which is novel is the list of instruments appended to every description of opera-HENRY H MORTON

INTERNATIONAL CLINICS Edited by HENRY W CATTELL, A M, M D Thirty-seventh Series, Volume II Octavo of 308 pages illustrated Philadelphia and London, J B Lippincott Company, 1927

This is an issue which all types of practitioners will find interesting L. F. Bishop's article, "A Heart-Block Clinic," will especially intrigue the diagnosticians and therapists Christopher's surgical contribution is note-worthy Two articles on public health are concerned with preparatory schools There is a considerable representation of foreign medicine, surgery and obstetrics as practised in the European clinics. This volume maintains the high standard set by its predecessors

FEEDING AND THE NUTRITIONAL DISORDERS IN INPANCY AND CHILDHOOD By JULIUS H HESS, M D 5th Edition, revised Octavo of 566 pages, illustrated Philadelphia, F A Davis Company, 1927 Cloth, \$4 50

In this book the author has given the generally accepted ideas of feeding. At the present time, with the large number of types of formula in vogue, a complete short review of the different feeding methods has its value. This part is a source of information to those who have not been able to follow the varieties in infant

The discussion of nutritional disorders is especially practical and is well worth while

An appendix includes diet lists, food preparation, ordinary methods of nursing technique and a list of the common proprietory foods with their analyses

The book while it contains nothing new is up to date HENRY A NAUMER. and complete

HOSPITAL LAW By JOHN A LAPP and DOROTHY KET-CHAM Octavo of 557 pages Milwaukee, Wisconsm, The Bruce Publishing Company, 1926 Cloth, \$8.00.

This comprehensive work covering all phases of hos pital law is a reference book which has long been needed by those interested in the organization and management of hospitals Members of the professional staffs of hos pitals will find many important legal cases cited which should interest them

The table of contents is worth noting Table of Cases cited

Introduction-Sources of Hospital Law Chapter II—The Liability of Private Hospitals.

A Manual of BRONCHOSCOPY AND ESOPHAGOSCOPY Peroral Endoscopy and Laryngeal Surgery By CHEVALIER JACKSON, M.D. 2nd Edition, reset Octavo of 457 pages, with 179 illustrations Philadelphia and London, W. B. Saunders Company, 1927 Cloth, 880.00

The second edition of this very valuable book is larger than the first and contains in some of its traditional pages, evidence of the progress that has been made in the field of bronchoscopy and esophagoscopy in the past five years

The book is the result of the extensive experience, both as a teacher and a bronchoscopist, of the acknowledged master in this field. For this reason it is regret table that there should be features of the book which may be open to question

Although the author states in his preface that "a working manual cannot be historic without a degree of bulk that would impair its usefulness," one cannot help but feel that sufficient history to give due credit to Killian, the originator of bronchoscopy, and to some of his contemporaries, should have been mentioned

The tendency to be dogmatic is justified when a master such as the author gives his written word. But where will you find bronchoscopists of acknowledged ability who will admit that they can always expose the larynx in less than one minute and pass the bronchoscope through in another minute. At the beginning of Chapter IX the author states "No one should do bronchoscop) until he is able to expose the glottis by left handed direct laryingoscopy in less than one minute. When he has mastered this one minute more should be sufficient to introduce the bronchoscope into the trachea'

The chapters on foreign bodies are particularly im There are many illustrations of a very instruc-The colored plates of laryngeal, bronchial and tive type esophageal conditions drawn by the author are a feature.

Bronchoscopists should find this book especially valu-Those in other branches of medicine who may be interested in bronchoscopy and its possibilities will be benefited by this manual

CLINICAL DIAGNOSIS BY LABORATORY METHODS A WORKing Manual of Clinical Pathology By JAMES CAMP-BELL TODD, Ph B, M D, and ARTHUR HAWLEY SANrord, AM, MD, 6th Edition, revised Octavo of 748 pages, with 346 illustrations Philadelphia and London, WB Saunders Company, 1927 Cloth, \$600 Among the numerous volumes, large and small, pur-

porting to describe laboratory methods completely, in a concise, accurate and modern manner, Todd and Sandford's Clinical Diagnosis by Laboratory Methods, in our opinion is by far the best. The theoretical aspect of the subject is relegated to a position of minor importance, actual descriptions, to the minutest details being clearly depicted Numerous illustrations, reinforced by adequate legends are placed in advantageous relation to the text. All in all, as a handy reference book to the clinical pathologist and his technicians it has no peer

MAX LEDERER.

RECENT ADVANCES IN BIOCHEMISTRY By JOHN PRYDE, B Sc., M Sc. Octavo of 348 pages, with 38 illustra-tions Philadelphia, P Blakiston's Son & Company,

Cloth, \$3.50

This book was written for those who wish to bring their knowledge of biochemistry up to date. Among the subjects treated are Protein catabolism, urea, the physical chemistry of proteins, the structure of nucleoproteins, carbohydrates, fats, phosphorus and sulphur compounds, vitamines, hemoglobin, the chemistry of immunity, and chemotherapy. Only the important recent work is described, as the reader is assumed to have a knowledge of the fundamentals. The author's discussions of the sulphur compounds. sion is at once interesting, clear, and adequate. The free use of structural formulas and charts adds greatly to the value of the text. Each chapter is followed by a A H EGGERTH Inbliography

THE SCIENCE AND PRACTICE OF SURGERY BY W H C. ROMANIS, M A., M D, and PHILIP H MITCHINER, M D Two Volumes Vol 1—General Surgery Oc-ROMANIS, M.A., M.D., and T. T. M. M.D. Two Volumes Vol 1—General Surgery Octavo of 795 pages, with 666 illustrations Vol 2—Regional Surgery Octavo of 955 pages, with 666 illustrations New York, William Wood and Company, 1927 Cloth, \$12.00

The aim of this work, as stated by the authors, is primarily to place before the student a book that is sufficiently comprehensive to provide him with all that he will require in passing his ordinary surgical examinations, or any higher examinations to which he may aspire, and secondly to present a book that may be of value

as a work of reference to the medical practitioner. In the fourteen-hundred pages of reading one notes the essentials of anatomy, clinical and physical findings and the treatment of surgical diseases, as well as sufficient illustrations to clarify obscure points or methods

described

One notes some variance from the more commonly accepted methods of many American surgeons, a fact that should not be unexpected in a work from surgeons of another country even though in the main surgical methods have become so simplified and so generally known that one could almost say they were standardized, were it not for the fact that the latter term is held in disrepute because of its benumbing effect upon individual

thought and original ideas
But "Shades" of McBurney! How that illustrious surgeon of hallowed fame would protest, could he but make his voice reach this mundane land, at the statement that "the McBurney moision is now quite out of date, and its use marks a total lack of surgical balance. A broad inquiry would easily show a not limited use of this method of entrance to the right abdomen in selected

cases by many surgeons of no mean balance and repute For quick and ready reference these two volumes will fill a valuable place, and will be found to contain the fundamentals and essentials of the knowledge of surgery, and prove a valued addition to the library of the general practitioner as well as the surgeon

ROGER DURHAM

TREATMENT OF VENERAL DISEASE IN GENERAL PRACTICE By E T BURKE, DSO, MB 12mo of 162 pages, illustrated New York, Oxford University Press, 1927 Cloth, \$1 75

This little book contains much of value to the general practitioner and should meet with a ready demand

The author laments the fact that, in many books on this subject, there is a lack of detail and a vagueness when it comes to the treatment. It is this fact that has stimulated the writing of the book. Many old-fashioned ideas are criticised and replaced by those which are strictly up-to-date

He takes occasion to censure the English physicians for so frequently using other European pharmaceuticals

when equally good ones are obtainable at home

He considers bismuth far more effective as an antiluctic than mercury, in fact, he has not used any of the latter for the past two years. Valid reasons for this are given. Burke expresses the relative value of the antisyphilitic triad as follows Arsenic, 10, Bismuth, 8, Mercury, 3 Mercury is never employed excepting when bismuth is either not tolerated or unobtainable Bismuth is given in separate courses from salvarsan for the expressed reason that, when both are given together, the spirocheta may become more resistant.

In gonorrhea, vaccines are used in all stages

Many readers will not agree with the author's method of injecting the urethra and bladder per catheter for the treatment of acute posterior urethritis

Much praise is given to the treatment of arthritis with

intravenous injections of electrargol

In cerebro-spinal lues, the author has obtained best results with intravenous therapy plus spinal drainage, A sound knowledge of venereal disease is displayed by a practical clinician of wide experience.

CLINICAL CASE-TAKING. Supplement to Methods in Medicine By George R Heremann, M D Octavo of 90 pages The C V Mosby Company, 1927 Cloth,

This volume of ninety pages is a valuable addition to the author's publication, "Methods in Medicine," as it embodies the constructive criticisms made in reviews of the "Methods in Medicine." These suggestions have been noted and more detailed facts of history-taking have been presented No laboratory methods are given as these are well presented in the original volume, but many details of diseased conditions are presented and, by following the data given, our histories will be much more complete and useful. These two volumes by the author should be used by every physician who would be up to date HENRY M. MOSES

OUR NEIGHBORS

THE NATIONAL GRANGE AND RURAL PHYSICIANS

The Ohio State Medical Journal of February contains a report of the action of the National Grange in its recent annual session in Cleveland in adopting a memorial to the American Medical Association asking that body to solve the problem of medical service in rural communities. The following abstracts are taken from that memorial

"The type of graduates now being produced by our medical schools will not settle and practice in the country districts This is conclusively proved by the experience of recent years The family doctor is rapidly becoming extinct He is being replaced by the specialist to a degree that is not warranted under practical conditions The need is for more general practitioners, whose outlay in time and money in securing their medical education will be such that their services will be within the reach of the rank and file of the people who constitute the overwhelming majority of our population, whether urban or rural We are not advocating one class of doctors for the country, and another for the town Neither are we advocating any lowering of medical standards is required is more practical instruction, which may be acquired in less time and with the expenditure of less money than under prevailing conditions We find that it is the opinion of many physicians of the highest standing that present medical education is not giving the most resourceful practitioners for ordinary services, it is producing practitioners who are dependent upon hospitals and laboratories, while these facilities, according to authoritative medical opinions are necessary in hardly more than 10 per cent of illnesses and accidents

"It is in the care of this 90 per cent of illnesses for which independent, resourceful physicians are necessary, that the rural communities are mostly in need. For the 10 per cent of emergencies, requiring specialists and hospital service, rural people can, perhaps, in most cases by an effort utilize urban facilities.

"However, the cost of these distant facilities make them impracticable for rural people except in cases of emergency. Because of their cost they are not practical for 90 per cent of the ordinary illnesses and accidents which, in the aggregate, produce the greatest sum of suffering, and whose early neglect leads to the serious emergencies. This 90 per cent of illnesses cannot be handled through distant doctors and urban hospitals. If the people are

to have adequate medical service, they must have physicians in their own communities

"It is for the people to determine whether it would not be good policy, as necessity demands, for the states to build and maintain medical schools solely under public control and

responsive to the needs of humanity

"We note that there are many distinguished physicians in the United States who believe that a proper madical education can be given upon the basis of a high school education and four years of subsequent training, provided this includes at least one year of practical experience in a hospital, that unanswerable evidence to confirm this opinion is furnished by the fact that many of the physicians of the highest standing in the country at the present time and an equally great number of your most useful servants of society, but of less distinction, scattered throughout the country have If such a had a training not exceeding this training will produce competent physicians, we think that the argument is unanswerable that such physicians will be less expensive and their services more widely available to the people

"We feel that we should call the attention of the profession to the fact that we are compelled by force of circumstances to be concerned with the usefulness of the medical graduates that are turned out and their apparent falture under present conditions to meet the needs of rural communities. In our opinion, the only adequate remedy will be found in the adoption of a more rational system of

medical education"

Commenting on the Memorial of the Grange, the January issue of the Journal of the Iowa

State Medical Society says editorially

"It appears to be a definite fact that men in the medical profession are governed by the same business principles that govern other The medical practitioner has business men made certain investments with a view of preparing himself for a gainful practice and if in a country community the rewards of a practice are not adequate to secure a comfortable living and make provision for the future, it becomes necessary for him to make certain changes, which may be the giving up of an unremunerative country practice for a practice in a large town, or the abandoning altogether a general practice and taking up a specialty In certain states and communities special provi-

(Continued from page 288)

sions are being made to supplement the fees naturally coming to him in due line of practice, so as to give him a comfortable living and something more These efforts-have been more or less successful according to the generosity of the community, and the acceptance by the doctor himself

"These provisions have been too limited to meet the general demand that is being made to secure a competent medical practitioner There has been much discussion among the medical profession as to a change in the plan It has been held that of medical education shorter terms of medical training will qualify a group of practitioners who are willing to set themselves up as second rate doctors. It has been held, that it would be quite impossible to secure a sufficient supply of medical practi tioners willing to place themselves in such a professional light. It has been held also, that the general public would seriously object to being dependent upon medical practitioners who have only an inferior training, and therefore be quite unwilling to employ doctors classed as second rate, however good they may be, hence the doctor would fail in the plan of adequate compensation

"It may be worth while for committees on medical education to formulate and recommend a course up to a minimum standard for general

practice"

The January issue of the Texas State Jour nal of Medicine also comments on the memorial

of the Grange and says

"Dr Crowe, Secretary of the Texas State Board of Medical Examiners, recently informed us that he had sent a number of young physicians to rural communities, upon the earnest request of leading citizens, and that most of them have returned after having been virtually starved out, to seek connections elsewhere, from which they might make a living Speaking further on the question, Dr Crone had the following to say

"'Whether you are aware of it or not, it is true that when the "stork" is expected at the home of farmer Jones, who owns a thousand acres of rich, well-cultivated land, substantial, commodious barns, full of first-class equipment, a fine residence and two or three expensive automobiles, he sends his wife to the hospital, when his son or daughter has an attack of appendicitis or has been injured in an automobile accident, he bundles him or her into his limousine and rushes to the hospital, when a member of his family is a victim of typhoid fever, tuberculosis, cancer or any other serious condition, he does not call in the country doctor, but hastens with his wife or child

(Continued on page 291-adv run)

(Continued from page 290)

to the hospital, where he expects to get the most expert service. This is true of Farmer Brown's family, Farmer Smith's family and of the families of other prosperous farmers in the community. What, then, is left for the little, country practitioner besides serving the families of those who are unable and perhaps unwilling to pay for attention, prescribing for minor conditions and opening an occasional boil, extracting an ingrown toe-nail or pulling a tooth?

"The country doctor must live, and if there is not a living for him in the rural community, he is forced to find something else to do or go to the city, which he most frequently does—only to learn that the urban profession is over-crowded and that his service is seldom wanted'

"There are many good people who are devoting their lives to missionary work in foreign countries, without remuneration beyond the point of a livelihood, and a large proportion of these are doctors. It is this self-sacrificing, pioneer spirit and regard for humanity that has distinguished the Anglo-Saxon race and the combination in this country that we call American Perhaps it is upon this psychology that we depend for a large proportion of our practicing physicians It is doubtful whether the supply will suffice for modern de-The public must appreciate the need of making medicine attractive if it wants an ample supply of good doctors, and communities must arrange for their doctors, not by hiring them on a salary basis, but by assuring them of financial and moral support

"It is not possible to secure satisfactory medical service for a salary The conditions surrounding the practice of medicine are so exacting, so complicated and so impossible of control, that the service can be rendered upon a basis of personal contact, and that alone Wide experience in State Medicine in some of the European countries have amply demonstrated that fact, and a moment's thought will lead to the same conclusion The very nature of the practice of medicine would require that it remain personal, and intimate personal relationships can never be made a matter of official or governmental concern, the Shepard-Towner Maternity Law to the contrary not-Withstanding "

Oklahoma, as well as New York, feels the need of more physicians in rural communities. The January issue of the Journal of the Oklahoma State Medical Association discusses the causes of the scarcity in the following editorial

"The growing scarcity of physicians in rural communities and a relative increase in urban

SEALED AMBER BOTTLES

Protect the Vitamin Potency of

PATCH'S FLAVORED COD LIVER OIL

It is now generally agreed that cod liver oil is the richest known source of vitamin A and anti rachitic vitamin. In the administration of cod liver oil however, much depends upon the vitamin potency of the oil which is prescribed.

Patch's Flavored Cod Liver Oil is recognized by the profession as a dependable highly potent product which gives definite results. This product is made in the Patch Company plants along the North Atlantic Coast from strictly fresh livers. In addition to the land plants the Patch Company operates cookers on trawlers which sail out of the New Eng land ports. On these trawlers the oil is made within a very short time after the fish are hauled in over the side of the boat. A sample of every lot of oil produced is biologically assayed. The vitamin potency is guaranteed. In order to preserve the high vitamin potency Patch's Flavored Cod Liver Oil is bottled at once in amber glass bottles to keep out the light. It is also promptly sealed to keep out the air. These processing the patient in its original potent condition.

Children really enjoy Patch s Flavored Cod Liver Oil because it tastes good. If you can give a small dose of highly potent and pleasantly flavored cod liver oil the problem of administration is solved.

NEW YORK CITY 90 FIFTH AVENUE

(Continued from page 291-adv xvii)

centers has been noted as a matter of grave Various medical concern for several years organizations have attempted to investigate the underlying causes and to adopt possible remedial measures As conditions, as a rule, are very similar throughout the country, it is worth while for Oklahomans to begin to ponder the matter

"It is well known that there has been a simi lar trend in Oklahoma, especially in the last fifteen years The reasons for this are similar to those believed to exist elsewhere These

"A decrease in the number of medical schools, with a consequent decrease in students. In 1904 there were 28,000 students in 166 medical schools of the country, and 5,700 men were graduated In 1919 there were a few less than 13,000, in 1922 only 2,529 men were graduated, the number of schools having fallen to 81 In 1926 there were only 79 schools, 61 of these being grade A colleges In spite of this, stodents had increased to 18,840, graduates that

year numbered 3,962

"Rapid transportation, made possible by bet ter roads and the automobile, have undoubt edly been a great factor in the shifting of medi cal populations from small, unattractive towns to the larger centers Small Oklahoma towns, formerly having from one to three physicians, today have none, but except for urgent emergencies the needs of the community are fairly well met by the use of telephones and ease of access to the physician It is pointed out in many localities only the older physicians will remain in the smaller communities, that the) are rapidly disappearing, and their places are not being filled by younger men, who can see no great future or promise of much material

success in such locations

"The cost and length of time of medical edu cation has uniformly increased during the last decade and a half, and the younger men can hardly be criticized for refusing to locate in places maccessible to the urgently needed laboratories, hospitals and consultation facilities which their training has convinced them are necessary, if they are to successfully apply the technic and knowledge they have gained at much cost of time and money It has been suggested that medical education be somewhat curtailed to meet the conditions, that consider able of the research and technical phases now demanded of the student might be eliminated, and at the same time prepare him for most of the problems of a general practice. This has not met favor with educators or students, and probably will not It is inconceivable that am bitious young men will accept any less than the best obtainable

(Continued from page 292-adz xxiii)

"A few localities have tried and report success, in the plan to guarantee a minimum fixed sum, but that is in the experimental stage Apparently it must be considered sooner or later by communities finding themselves without proper medical service. The entire matter is surrounded by many complex problems, it is affected by many things, at first thought not One authority is of the connected with it opinion that over-standardization and overworking so-called 'efficiency' demands, is more than any other thing responsible. However, it is difficult to lay the blame upon any one condition, probably solution will be best met when it is understood that very diverse factors, educational, economic and sociologic, all have something to do with the growing scarcity of physicians in rural communities"

The January issue of the New Orleans Medical and Surgical Journal, in closing an editorial on the distribution of physicians in Louisiana,

"It will be seen from these statistics that in this section of the South there is not the possible acute need of doctors in the rural communities which may prevail in other regions. It has been said that development of good roads, automobiles and rapid transportation facilities has resulted in making one doctor take the place of three. This is probably the solution of the difficulty, a difficulty which is unduly magnified in the North, and which does not exist in the far South"

MEASURING THE BLOOD SUPPLY OF THE EXTREMITIES

The physician is often confronted with conditions in which the blood supply to the extremities, especially the feet, is diminished by arterial spasm, arteriosclerosis, pressure of a tumor, or other cause The February issue of the Ohio State Journal contains an article by Dr Walter G Stern of Cleveland, on tests of the sufficiency of the circulation The author describes the three older tests of the rise of temperature of water in which the feet are immersed There is an electrical temperature testing needle in which the needle is thrust into the limb, and a tourniquet applied until the limb falls in temperature The rapidity of the rise in temperature after the tourniquet is removed is taken as an indication of the efficiency of the circulation Another test is the injection of radiopaque substances into the arteries and the fluoroscopy observation of their progress through the blood vessels There is also an

oscillometer to record the amplitude of the pulsations of the main artery

The author then described observations on the disappearing time of wheals produced by the injection of normal salt solution into both normal and edematous legs, and found that the time depended on the sufficiency of the arterial supply. The article then describes the test as follows

"By means of a tuberculin syringe and a terfine needle, 02 cc of 085 per cent solution is The eye of the injected intracutaneously needle should be visible through the outer layer of the skin when the injection is made. The first injection is made at the base of the great toe, and similar ones are made at 4-inch intervals up to the leg and thigh The sense of touch is used to determine the disappear ance time, as the vasomotor changes produced by the injection often render visual judgment Normally, sixty minutes or unsatisfactory more is required for the complete disappear ance of the wheal produced by the injected fluid, though readings as low as thirty minutes at the base of the great toe have been con sidered normal (as we have one such reading in a patient without clinical evidence of vascular disease), but as a general rule sixty min utes or more may be considered as the normal disappearance time In cases of circulatory disturbance the disappearance time of the wheal is reduced to one-third or one-fourth, at times even to one-twentieth"

The author cites four typical cases, the first one being that of a man, aged 38, who had frozen his left foot twice, so that the foot became gangrenous The results of the intracutaneous test are shown by the following table

"Disappearing time (minutes) of wheals on left (gangrenous) leg

	(gangrenous) leg	٠
1	Just above area of gangrene	5 15
2	Ankle	10
3	Lower calf	18
-	Calf	16
-	Upper calf	20
	Knee	30
7	Thigh	30
8	Upper thigh	60 plus

The diagnosis was thrombo-angiltis, and the freezing of the foot was the result of the poor circulation. The disease has extended to the right foot which had not been injured.

The article ends with the following sum mary

"I In the absence of edema, the intracutaneous salt solution test is a simple, rapid and

(Continued on page 295-adv xvi)

(Continued from page 294—adv xx) accurate method of determining circulatory deficiencies in the extremities

"2 Sixty minutes or more is the normal dis-

appearance time of the salt solution

"3 In all instances in which clinical circulatory deficiency exists, the disappearance time is diminished, in the area just above the seat of a gangrene (existing or threatened), it is frequently as low as five minutes"

THE JOURNAL OF THE MICHIGAN STATE MEDICAL SOCIETY

The February issue of the Journal of the Michigan State Medical Society contains a report of the mid-winter meeting of the council, at which reports were given by the officers of the society. The Secretary-Editor, Dr. F. C. Warnshus, described the work of the Journal in an eläborate report. The Journal has a circulation of 3,350 copies. The cost of publication was \$15,971.41 and the receipts were \$16,653.90, thus showing a profit of \$682.49. However, a salary of \$4,000 was paid to the editor, and presumably office rent was paid.

Regarding the editorial policy the editor

writes

"Our Editorial ideals have been to impart scientific instruction, to afford a medium for our members for the publication of their personal and collective investigations and experiences, to keep them enlightened as to public health activities and tendencies, editorial discussion and comment upon our common professional economic and social problems, the recording of our state and county organizational activities and the imparting of items of news and progress Supplemental to all of which we have ever borne in mind that our Journal constitutes the Archives of our Society"

The Journal has not been copyrighted, but beginning with this year, each number will be copyrighted, the immediate reason being to prevent the exploitation of articles for self-

advertisements

The publication committee is planning a department of Post-graduate education for the purpose of "imparting through planned special articles a definite course of reading covering the main branches of medicine. That the Publication Committee, with the Editor, be authorized to select a staff of writers for this department from the members of the faculty of the Post-graduate Department of the University and the Detroit Post-graduate School, and to supervise the department

We do plead for more practical articles imparting personal experiences, more case reports, more articles dealing with our public

SALIPYRIN "Riedel

is a chemical com bination of anti pyrin and salicylic acid. The thera peutie effects of both these components are preserved. although modified by close chemical union and in a very great degree deprived of the of medangers chanical mixtures

Salipyrin is distinguished from other salicylates by the comparative

freedom from ill-effects (absence of free antipyrin) and prompt antipyretic and sedative action.

Influenza, Colds, Catarrh of the Nose INDICATIONS and Throat, Rheumatism, Neuralgia, Alcoholic Excess, Pleur isy, Dysmenorrhes, Metrorrhagis, Vaginitis, etc. If given early in the attack, Salipyrin generally succeeds in aborting

Salipyrin is supplied in powder form and as SALIPYRETS in tablets of 71/2 each.

Approved by the Council on Phar and Chem. of the Amer ican Medical Association for inclusion with N N R.

relationships and responsibilities Then, too, for educational and entertainment we are eager to receive articles imparting personal impres sions of visits made to our own and foreign clinical centers Our plea to our members is to send in for publication, articles dealing with

these topics" The Secretary recommended that the edi torial and administrative work of the society be separated as is done by the Medical Society of the State of New York The plan has been adopted and Dr John H Dempster, of De troit, has been appointed editor, while Dr Warnshuis will continue as business manager of the Journal Dr Warnshuis has been editor of the Journal for sixteen years He is also Speaker of the House of Delegates of the American Medical Association

THE PUBLICITY COMMITTEE

Several State Medical Societies have publicity committees That of Nebraska is the sub ject of the following editorial in the January Nebraska State Medical Journal

"The publicity committee created several years ago has done a tremendous amount of re search work as a basis for action and has found the problem of publicity a difficult one to han dle successfully and diplomatically Those of us who have chafed for immediate and aggressive action have had little conception of the difficulties in the way Paid newspaper pub licity, as all may readily see, can easily be countered by like publicity from the cultists whose professional commercialism is undoubt ed, and whose publicity is thoroughly commercialized Great diplomacy must be used in our Education of the public must be by appeal to reason—not by appeal to the publicity work

sensational "It is perhaps early to speak for the newly reorganized committee, but it may be stated that the committee has in mind organizing a speakers' bureau and soliciting a number of representative men throughout the state, who will be subject to call to appear before various lay groups and address them on medical sub jects of public interest, and to get in touch with prominent lay organizations interested in public welfare and attempt to induce them to permit medical men to appear on their pro-It is also planned to arrange for a series of health talks once a week over the All of which seems feasible, practical and without objection

"The writer has always had a feeling, that metaphorically speaking the organized profession has too much indulged in hiding its light

under a bushel"

SURVEYS OF SURVEYS

The value of surveys depends on who makes them and the use to which they are put. A survey is often a collection of secondhand information in distinction from the firsthand knowledge of an actual worker in the field that is under investigation. The editor of the Journal of the Michigan State Medical Society does not approve all medical surveys judging from the following editorial from the January issue of that Journal

"The Bureau of Public Health and Instruction of the AMA has conducted a partial study of the number and scope of surveys that deal with public health and which have or are being conducted. The study covers a period of some twenty years and uncovers some interesting facts. Practically every phase of public health has been touched and every state in the union has been a field of work. There have been some 982 separate in estigations, and the United States Public Health service is credited with 1,013 surveys.

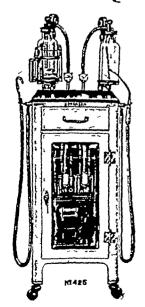

"In Michigan we have had 32 surveys classified as Cities 7, General 2, Maternity and Infant 2, Venereal 14, Tuberculosis 1, Sanitation 1, Health Education 3, and Miscellaneous 2

"As one surveys these surveys many questions arise What was accomplished? What were the conclusions? What was the need? Were the findings followed up and corrective measures instituted? Was there a subsequent check-up?

"Then, too, was there not destructive confusion and reduplications? Could not these facts be obtained just as adequately with less cost and labor in the decennial census? We are of the opinion that the majority of these surveys serve but one main purpose and that is to give employment to a horde of so-styled directors, supervisors field agents canvassers and secretaries at given salaries and expenses

"The preliminary facts seem to warrant the conclusion that the utter uselessness of a majority of surveys should be widely disseminated for the public's information. Also, that the money expended for these surveys might well be appropriated to more worth-while objects. There are far too many incompetent social economists preying upon the public in their useless endeavors and far too insufficient worth-while, constructive work."

IGIOUS INFLUENCE IN MEDICINE

The January issue of the Atantic Medical Journal contains a rief report of a mental case with a religious element by Dr Theotore Diller of Pittsburgh The case was described as follows

"A young man aged 22, prought to me by his mother, and been raised in the Catholic aith, and his mother was in great distress because he had ibandoned that faith and become in unbeliever in any form of Christianity

"I was convinced that the roung man was entirely normal, and that the mental change was lue to a slackening of interest nathings religious owing to entironment and to adolescent hanges quite normal. The nother was cautioned to let him alone for the present

"The case illustrates the fact that, in one phase or another, the question of religion must concern the physician It is one that he cannot and ought not to wish to escape, for it is a very large problem In this connecron, a quotation from that sound philosopher, Dr Samuel Johnson, is interesting On one occasion Boswell said to him 'Dr Brown has changed his religion and has left the Church of England and become a Baptist What do you think of it? Rephed Johnson 'Sir' I think very ill of it' Said Boswell You should not be prejudiced gim the matter because he has left the Church of England, for you have always supported the view that a man who is sincere and conscientious in his convictions, no matter where they lead him, is deserving of respect' Johnson replied 'Dr Brown is a man of forty, and if he is unsettled in his religious convictions at his age, he would be uncertain and wavering in a medical way, and I would have no confidence fin such a physician'"

is not merely a pure table or bottled water, but it is a valuable adjuvant in the treatment of many forms of kidney trouble on account of its bland diuretic properties.

POPULAR MEDICAL ARTICLES

The State Medical Society of Wisconsin has a regular press service to the newspapers of the state, which is described in the February Wisconsin Medical Journal as follows

"A service to the public that also brings results to the members in the way of increased use of medical facilities, better understanding of medical science and of the work of the family physician is the weekly press service of the State Society Now in its second year, this service reaches every daily paper of the state and approximately one hundred and sixty weeklies and the clippings from the press of only single stories make a newspaper column a hundred feet long

"The future success of the service will be more readily attained as individual members take it upon themselves to see that the stories are printed in their local papers. This service, endorsed by the State Board of Health as one of public merit, is furnished free to any editor of the state upon request.

"The reception which the press of Wisconsin has given to the weekly news stories of the State Medical Society has been due to a scrupulous following of these ideals The service was not founded to promote the interests of any physician or group of physicians No name of a physician ever appears in one of the news releases This rule has never been broken, and it is sincerely hoped that it will never be violated. Adherence to this principle is a notice to the news editor of every paper that this information is not furnished promote individuals, placed before the readers solely in the public interest

"Real accuracy of statement is sought That this may be made possible, leading physicians are invited to prepare 500 word statements on timely topics. The

mercial libitationes make use of these offino rate bred by the Wistar Institute for the scientific tudy of the sifamin content of Lyen the boy in the -treet not knews that foods vithout vitamin content worse than uscless and all the gno enti take their orange tuce is a most available form of manna-continuing food most regularl—cren though occa--1 nally diluted with bootleg gin in the form of a ricky. But even her the cognoscenti, will be so men hat surprised to learn that the vitainin content of these food stuffs are best determined by laboratory experiments on the bedigreed rats which are mostly inbred and all of whom are descendants through many generations of albino Norwegian rats It is interesting to note that the popular concept of the deterioration incident to inbreeding is an error for in an admirable monograph on inbreeding and outbreeding, East and Jones, American biologists, have demonstrated that inbreeding per se is not injurious, and deterioration shown when a stock is first inbred, being solely due to deleterious recessive Mendelian factors commg to life As a matter of fact, the inbreeding promotes homozigosity as opposed to heterozygosity, and, as all who are familiar with the Mendelian theory well know, a high degree of homozygosity is essential to produce standard offspring with uniform characteristics and resistance and such a standard is required, of course, in the examination of vitamin contents or in any other physiological standardization"

The word homozygosity means the quality of sameness and fixity of characteristics which are transmitted from parent to offspring

COSMETICS*

Composition — Dermatoses — Treatment

By LAWRENCE K McCAFFERTY, MD, and SERAFINO GENOVESE, MD. NEW YORK, N Y

THE use of cosmetics may be only temporary, but we believe it is here to stay If so, it is up to the dermatologists to aid in making them safe for the laity. We feel that the public would lend its support to the medical profession if it knew the dangers from the use of harmful cosmetic preparations. On the other hand, a word of encouragement should be given to American manufacturers of cosmetics who have avoided using the harmful substances

For centuries beauty was sought in strange and varied ways. If we consider this search for beauty in antiquity from a medical standpoint, there arises in our minds the picture of a large cauldron in which all manner of ingredients cook and bubble—salves, pastes, powders, oils, rouges and perfumes

The word cosmetics comes from the Greek Kosmos, ornament The use of cosmetics has come down to us from the Egyptians and Arabs The Egyptian girls used red and white clay for make-up They dyed their finger and toe nails with henna, their eyelashes and eyelids were dyed black and a perfume was sprinkled upon the hair Mummies found in Egypt show traces of henna and gold upon the nails

The Jews learned cosmetics from the Egyptians They adopted at first only salves and perfumes for religious purposes, but later they used them for self-adornment A quotation from the bible gives proof of this "Thou anointest my head with oil"

The Romans had creams for softening the skin, dyes and colored powders to lend fashionable color to the hair, and many perfumes Most of the cosmetics came from Gaul and perfumes were so lavishly used that Julius Cæsar and Lucinius Crissus prohibited the sale of foreign perfumes. It is said that Nero's

dining hall dripped perfume so abundantly that the eyes of his guests were often in danger. When the Roman women saw the blond Barbarians, they used alkaline soaps and Germanic wigs to affect the blond and red coloring. Even depilatories were used by the Romans as their dress called for the removal of all superfluous hair from chest, legs and arms. Both Greek and Roman men resorted to cosmetics, at least to some extent.

Rhazes and Avicenna, Arabian physicians, were the successors of the Roman doctors Diedor, Apollodor and Galen The cosmetic prescriptions of the Roman physicians appear in the writings of French doctors of the 9th century

The greatest French physicians in the Middle Ages were deeply interested in cosmetics Henri de Mondeville, who lived in the beginning of the 14th century and who was physician to Philip the Fair, wrote a treatise upon surgery In the latter part of his book, he says "I am now going to touch upon another chapter of cosmetics only superficially-it is a chapter on a subject which goes against the will of God and of Justice, and as a general thing it is not the treatment of a disease. Its object is to deceive and to conceal—besides, I take no pleasure in handling this side of the question However, should a physician live in a province or city where there live many wealthy ladies having the right to appear at court, and should he have the reputation of a man handling his art with dexterity, he might be able to turn this to his advantage and to obtain the favor of the ladies Without the protection of women, it is impossible to obtain anything or to be liked by the families one is treating-therefore, one seeks their favor even more than divine or papal good will"

De Mondeville mentions a few cosmetic treatments in his treatise which are as indiculous as the claims made by some of the present-day preparations. For example, De Mondeville states "To prevent wrinkles, applica-

REMARKS

REVIEW OF LITERATURE ON VALIOUS TOXIC INGREDIENTS

Mercury in various forms has been used as the principal ingredient in hair dyes and creams Its purpose in creams has been to bleach the skin or remove pigmentation Its principal combinations have been bichloride, ammoniated mercury in very high concentration and calomel It has occasionally been the cause of severe cases of mercurialism Goeckermann in 1922 described two peculiar discolorations of the skin, probably resulting from mercury compound (calomel) in proprietary face creams His first case presented a brownish-grey or slate-colored pigmentation of the nasolabial folds This pigmentation appeared in the stomata of the follicular mouths of the skin The face cream consisted of mercury and bismuth. His second patient presented similar symptoms, he found that the cream contained only mercury He thought that the alkaline perspiration resulted in causing these deposits

A hair die containing 106 grains to the ounce of arsenous acid has been known to cause a dermatitis with edema of the eyelids, as reported by Cole Bismuth, silver, cobalt, nickel and pyrogallic acid as used in hair dyes have been known to produce injurious results in patients Olson in 1917 reported a case of Argyria localis due to an organic silver prep-

The above metallic preparations have all been the cause of much trouble in the past However, the principal offender at the present time is paraphenylendiamin. It is a synthetic anilin compound used for dyeing hair, furs and We see more cases of dermatitis today from its use than from any other com-The symptoms resulting from its use as a hair and fur dye are too well known to require further remarks. We believe that many cases of so-called neurodermatitis have their origin from the fur dye dermatitis. Thibierge and Lacassagne have recently stressed this point

There are various ingredients used in cosmetics which occasionally produce a mild but troublesome dermatitis. It is difficult at times tions of the juice of the grape-vine root with an addition of honey"

Poets of the Middle Ages wrote of cosmetics in a satirical manner, as is exemplified by the poem "Parsifal" (12th century) The monk Montaudon (end of the 12th century) in a poem says to God "Women will not cease to paint themselves until you give them beauty lasting until death, or until you let all coloring-material disappear from the earth"

About 1760, the pendulum began to swing back to nature Hair no longer was powdered and very little powder was used upon the During the close of the 18th century. Parisian women had given up the use of cos-In 1779 English Parliament prohibited the use of any make-up. In 1788, an unknown German physician warned against the use of cosmetics, especially those made in France However, during Napoleon's reign, cosmetics attained again in France almost the same importance that they had during the reign of Louis XV From then to the present day, cosmetics have been used perhaps

more in France than any other country
The use of cosmetics has never been as great in England or Germany as in France, but during Elizabeth's reign, England made great use of perfumes and cosmetics continued until Parliament passed the law, to which we have referred above

In the United States, from the days of the Pilgrims to the early part of the 20th century, cosmetics have been frowned upon We all remember the days of our mothers and grandmothers, and yet, if we reflect for a moment, we dare say that none can remember the use of rouge on lip or cheek The use of cosmetics in those days was left generally to the courtesan What a change there has been in the last fifteen years! One might fix the date of the excessive use of cosmetics in our own day in the decade 1910-1920, with the beginning of the World War A woman of today is almost conspicuous if cosmetics are absent in her make-up Statistical figures, which follow, will bear us out in this statement STATISTICAL DATA

titis from the use of soap, if a cold cream were substituted for the soap, the disagreeable dryness disappeared and the dermatitis no longer made its appearance The cold cream acted as We were an efficient cleanser for the skin unable to detect any so-called "clogging of the pores" after the cream had been thoroughly massaged into the skin and carefully removed with a soft towel The cold cream was of no particular value to those patients whose skins were exceedingly oily, yet it apparently did no harm Vanishing cream has such a high content of water that when it is massaged into the skin, the water freely evaporates and the solid particles are rolled beneath the fingers into small balls and in this way are removed-hence the name "vanishing". There is only a very slight amount of oil left upon the skin - after the use of vanishing cream We do not feel that vanishing creams are of any value, but if it is necessary to use a cream, we suggest the use of a cold cream The only object of a vanishing cream is to act as a base for powder, but this same thing can be accomplished by cold cream

The soaps which we used, contained the minimum amount of alkalinity, that is, one-tenth of one per cent, when dissolved in water

Fig 4

Neurodermatitis which resulted from continuous scratching produced by irritation from a dyed fur (paraphenylendiamin)

When this soap was used for a few weeks by the patients whose skins were moderately dry, a very mild desquamation with slight reddening and the feeling of tautness developed When the soap was discontinued and a cold cream applied, this condition cleared up one patient whose skin was moderately dry, a dermatitis developed from the use of this soap after twenty-four hours After the dermatitis cleared up, we again had the patient use the soap and the same condition reappeared There are certain individuals whose skins are dry and who will occasionally develop a dermatitis when any soap is used, we suggest here that cold creams be substituted in those patients whose skins are dry When the soap was freely used by patients whose skins were excessively only, this disagreeable oiliness disappeared but recurred very promptly after the soap had been discontinued Popular American toilet soaps are pure and contain, as a rule, the minimum amount of alkalinity Their use is by no means contraindicated, unless the skin is extremely dry

Most reliable manufacturers of face powders today do not use lead or mercury, but substitute with harmless ingredients. We do not feel that powders are harmful if made, to some extent, according to the formulæ we have pre-

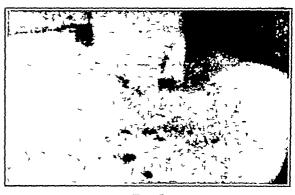

Fig 5

Keloids resulting from irritation produced by perfume. (Courtesy of Dr J Gardner Hopkins, Vanderbilt Clinic)

sented, the powder granules may clog up the follicles if the orifices are large or patent, but gentle massage with cold cream will frequently remove this foreign debris from the follicular orifices

Rouge and lip stick, when properly made, are harmless. The coloring material should be natural rather than anilin derivatives, if possible, however, irritating solvent amins—especially benzol—should be avoided

We can see nothing harmful in eyelash blackening, nail polish, nail polish remover or nail bleach. Of course, there may be an occasional case of dermatitis if these latter substances come in contact with the skin in susceptible individuals, as cited by Miller and Taussig, but in general these cases are few and far between.

All depilatories are irritating when improperly applied If the formula we have cited be used, we advise removing the depilatory by bathing with warm water and then applying a cold cream, if a dermatitis should appear, we recommend immediate discontinuance

We may summarize our remarks by citing the sanitary code from the Department of Health of New York City, and also to refer those of you who are interested, to the resolutions which have been drawn up by the Division of Legal Medicine, office of the Commissioner of the Department of Health of New York City These resolutions are intended for

to ascertain the real cause Miller and Taussig in 1925, reported some interesting observations. They discovered that the anilin dye used as a coloring material in the bizarre tints

Fig 1
Dermatitis resulting from paraphenylendiamin used as a dve for the patient's hair

for face powder, rouge and lip stick may cause They cautioned against the use a dermatitis of phenol in an attempt to remove wrinkles They cited a case of dermatitis on the neck resulting from finger nail polish Another of their patients developed a dermatitis from eau de cologne However, this applies to other perfumes as well One of us had a patient who developed a dermatitis on the nipple patient was in the habit of dabbing on a little Quelque fleurs daily Women are prone to apply perfume to eyebrows, temporal region and behind the ears, and occasionally a dermatitis will result About a year ago, one of us

Fig 2

Dermatitis which resulted from a fur dye (paraphenylendiamin)

(Coi riesy of Dr J Gardner Hopkins Vanderbilt Clinic)

saw a patient at the hospital, with a severe dermatitis of the face. This condition had been present more than two years at various times. While talking to the patient, she drew from the table a large bottle of perfume and smelled it for several seconds, this perfume was removed from her room and she cleared up in a few days with the aid of a soothing ointment.

Many of our perfumes in America and some in France are synthetic today. Just what ingredients in synthetic perfumes cause this condition, we are at a loss to say at present. There is a negligible amount of perfume in creams, rouge, lip stick and powders that can be usually disregarded, however, it must be borne in mind as a possible cause of dermatitis. We do not recall having seen in the literature or in our practice, any cases of dermatitis resulting from the minute quantity of synthetic perfume used in the above mentioned cosmetic preparations.

Orris root, which is an ingredient of some face powders, may in certain susceptible individuals, produce a mild dermatitis. Our colleague, A. H. Montgomery, has recently seen several such cases. Synthetic coal tar derivatives of which the principal ones are eosin, erythrosine and alizarin, may cause a dermatitis, as pointed out by Miller and Taussig. These should be substituted wherever possible with

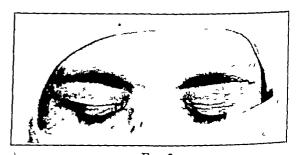

Fig 3

Dermatitis of the eyelids resulting from perfume (probably synthetic) being applied to the eyebrows

(Courtesy of Dr J Gardner Hopkins, Vanderbilt Clinic)

natural colors such as carmin, yellow ochre and burnt sienna, to produce the various One of us saw a very interesting shades dermatitis of the upper lip develop from the use of a lip rouge It is possible that the anilin dye here was responsible for this However, when the patient used another make of rouge with exactly the same shade of coloring, There is such an no dermatitis developed appreciably small amount of dye - whether natural or synthetic-in these various cosmetics, that in general, we feel that the anilin dves may be used, but one must bear in mind their possibility as a cause of dermatitis

One of us experimented clinically for several months with cold creams, vanishing creams and soaps. The observations may be of some interest, and for this reason, we will briefly summarize. Out of a group of twenty-five patients, there was not a single case of dermatitis produced from the use of either vanishing or cold creams of a special formula. It was found in those patients who had a dry skin and occasionally developed a mild derma-

does not include the dyes sold over the drug-

gists counters for self application

There are approximately 15,000,000 packages sold each year, one firm alone reports 4,500,000 applications in two years

HAIR TONICS

30 cases reported by 62 dermatologists At least 10,000,000 people use hair tonics

The small number of cases of dermatitis reported is misleading because only a few physicians took the trouble to make reports. The percentage is very much higher than indicated above, yet not alarming

BEAUTY SHOPS

According to Dr Dana Hubbard (14), in 1925 in the United States, sixty million men, women and children visited public beauty par-There are 170,000 persons employed in beauty shops at present who style themselves "cosmeticians" There are 135 training schools in the United States where instruction is given to future cosmeticians, the average fee for the course of instruction is \$250 Dr Hubbard states that these schools turned out 20,000 graduates in one year. It was estimated that in the regular shops, the sum of nearly \$400,-000,000 was taken in for the year 1925 Eleven of the forty-eight states have statutes regulating the activity of beauty shops and require operators to have a license

No doubt these figures will astonish you as much as they did us. We have no grievance against the amount of business transacted by beauty shops, but we do object to attendants in some beauty parlors prescribing, recommending or giving certain forms of treatment for pathological skin conditions. Most of the patrons who frequent beauty shops do so because of a dry or oily skin, patent follicles or conditions of a similar nature. However, occasionally a patron may have a superficial epithelioma, pigmented mole or even the manifestations of a secondary syphilis. It goes without saying, that such conditions require

the attention of a physician

One of us recently had a patient who consulted him regarding pigmented moles upon the face. This patient stated that she had been to one of the well-known beauty shops of New York City, where a cream was given her for the purpose of removing these pigmented moles. There was apparently a mercurial compound in this cream, as a decided dermatitis developed around the moles in question. Of course, if this patient had continued using this preparation, one of the pigmented moles might have been stimulated to malignancy. Another patient who consulted one of us recently, presented a superficial epithelioma on the tip of

the nose. About a year before, this woman had seen another physician who advised radium. She visited a beauty parlor in New York City for the purpose of purchasing some cream for her face. While there, she spoke to one of the attendants about the lesion on her nose, stating that a physician about a year previously had suggested radium. The attendant, who was dressed as a nurse, replied that radium was not the thing to use, and if it were, they would advise her as they always had a physician in attendance. She was given some cream and told to apply this to the lesion and it would disappear.

These two cases bring out the point that we wish to make, which is that in case any physician has a patient consulting him who states that treatment had previously been given her for any pathological skin condition in any beauty shop on the advice or suggestion of any of the attendants, these facts should be turned over to the Department of Health of New York City, who in turn will investigate, as it is a violation of the Medical Practice Act sicians in general, especially dermatologists, will co-operate with the Board of Health regarding these irregularities which occur in some beauty shops, we feel confident that such practices can be eradicated The Medical Practice Act of New York State was made a law to protect the public from being medically treated or advised by anyone excepting licensed physicians

Various preparations, such as "astringents to close the pores," wrinkle removers and so forth, which are so extensively sold to women seeking youth and beauty, need publicity by the profession to expose their inefficacies. Time will educate the public along these lines, but the duration may be shortened if the dermatologists will lend their support

presentation to the American Medical Association this year. Time and space will not permit us to cite the resolutions, but the sanitary code states "That hair dyes and other toilet preparations containing paraphenylendiamin, lead or mercury or any other poisonous ingredients are prohibited from sale or distribution, and so forth" If these resolutions, including the sanitary code, which have been drawn up by the Department of Health, City of New York, are incorporated in some way into the Pure Food and Drug law, we believe that the solution of the problem for the removal of dangerous ingredients used in cosmetics, will be solved

Fig 6

Enlarged follicular orifices resulting from comedone type of acne. These orifices are approximately one millimeter in diameter. Experimentation with astringents for several weeks did not reduce their size as far as could be observed.

TREATMENT

The treatment of cases of dermatitis from the use of cosmetics may be answered by a word-discontinuance of the offending ingredient and usually the dermatitis will clear up However, it is not always easy to promptly discover this harmful ingredient. It requires much time and patience on the part of both physician and patient. It may be necessary for the patient to stop the use of all cosmetic preparations, to lay aside furs and wear only clothing-including hats-that contain no dye At times it is difficult to get the patients to co-operate as they are prone to believe that their condition is the result of uric acid or an eczema from internal origin We see so many cases of dermatitis from external origin today,

that we agree with Walter Highman that true cases of eczema from internal origin are few and far between. We have found small doses of unfiltered X-rays as the first therapeutic meas ure. In all cases of dermatitis, if the symptoms comprise edema and serious exudation, we prefer wet dressings of boric acid along with radiotherapy. If it is the dried, dequantating type, we prefer a soothing ointment. Most of these cases will clear up within two or three weeks, but are sure to recur if the real cause is not found and removed.

COSMETICS (A M A)

Injuries reported by 52 dermatologists

One of us recently had a patient who consulted him regarding pigmented moles upon This patient stated that she had been to one of the well-known beauty shops of New York City, where a cream was given her for the purpose of removing these pigmented moles There was apparently a mercurial compound in this cream, as a decided dermatitis developed around the moles in question course, if this patient had continued using this preparation, one of the pigmented moles might have been stimulated to malignancy Another patient who consulted one of us recently, presented a superficial epithelioma on the tip of the nose About a year before, this woman had seen another physician who advised ra-She visited a beauty parlor in New York City for the purpose of purchasing some cream for her face. While there, she spoke to one of the attendants about the lesson on her nose, stating that a physician about a year previously had suggested radium The attendant, who was dressed as a nurse, replied that radium was not the thing to use, and if it were, they would advise her as they always had a physician in attendance She was given some cream and told to apply this to the lesion and it would disappear

These two cases bring out the point that we wish to make, which is that in case any physician has a patient consulting him who states that treatment had previously been given her for any pathological skin condition in any beauty shop on the advice or suggestion of any of the attendants, these facts should be turned over to the Department of Health of New York City, who in turn will investigate, as it is a violation of the Medical Practice Act If physicians in general, especially dermatologists, will co-operate with the Board of Health regarding these irregularities which occur in some beauty shops, we feel confident that such practices can be eradicated The Medical Practice Act of New York State was made a law to protect the public from being medically treated or advised by anyone excepting licensed physicians

Various preparations, such as "astringents to close the pores," wrinkle removers and so forth, which are so extensively sold to women seeking youth and beauty, need publicity by the profession to expose their inefficacies Time will educate the public along these lines, but the duration may be shortened if the dermatologists will lend their support

SMALLPOX AND CHICKENPOX—THE DIFFERENTIAL DIAGNOSIS* By FRANK W LAIDLAW, M D, MIDDLETOWN, N Y

URING our college days we all formed, from the textbook description, a mental picture of smallpox which was clean cut and distinctive, and most of us believed that we would have no difficulty in recognizing a case should the necessity arise. In actual practice some of us have found that it is a diagnosis to be approached with the most profound respect and the greatest caution "Smallpox has a power of deception which is as subtle as it is formidable"—(Wanklyn)

Many of us feel that smallpox is necessarily a more severe disease than chickenpox. This idea sometimes influences our judgment. It is truly surprising to realize in how mild a form smallpox can exist. The differential diagnosis between chickenpox and smallpox is extremely important, and we wish to call attention to a few features which we believe will be of considerable assistance.

It is unnecessary to give the classic description of the disease. This can be read in any text-book covering the subject. We wish particularly to call attention to important points, and to note some which are frequently looked upon as important, but which are really misleading.

The distribution of the lesions of the eruption is the first point to be considered. It is of decided advantage to examine the patient before taking the history, so as to avoid the bias which the history may produce. Smallpox may not present prodromes, and two or three days of illness may occur previous to the appearance of the eruption of chickenpox, particularly in adults

The patient should be stripped to the waist and placed in a good light An opinion should never

be formed without at least this amount of surface exposed for the purpose of comparing different areas. The face, when examined alone, some times presents a striking resemblance in the two diseases.

The distribution should then be studied carefully without at first paying any attention to the character of the lesions

The distribution of the eruption In smallpox there will be a greater proportionate number upon the face than any other part. The arms will come next with more below the elbow than above. The legs are next in order with a greater number be low the knee than above. The trunk will show the least, the abdomen having a smaller number than the chest. In short, the distribution is a "centrifugal" one.

In chickenpox the distribution is exactly the reverse of this—the trunk will show the greater number and the eruption diminishes upon the extremities the further from the trunk it is located. The face examined alone may show a considerable number of lesions, but in comparison to the chest the picture is altogether different.

It may be said that smallpox prefers exposed surfaces and that chickenpox prefers protected ones. Therefore smallpox lesions are comparatively few in the armpit, generally not present at all, while in chickenpox they are comparatively numerous in this locality. The same is true of the groin. With the foregoing description in mind, examine carefully the diagrams which are taken from Special Bulletin No. 36, issued by the California. Board of Health. The diagrams are credited by that Bulletin to Goodall and Washbourne's Manual of Infectious Diseases.

We earnestly request health officers to study these two sets of diagrams and to keep them in

^{*} From the February first issue of the Health Officers' Bulletin of the counties of Greene, Ulster, Orange, Rockland and Sullivan of which Dr Laidlaw is District State Health Officer

mind in making this differentiation. A diagnosis of either smallpox or chickenpox should never be made until it is determined that the distribution conforms to that of the disease upon which the conclusion finally rests. Ricketts stated many years ago, "However much the lesions may be altered in character, the scheme of their arrange-

Fig 1 Distribution of Smallpox Eruption Note that the distribution of the eruption is "centrifugal," more profuse upon the face, forearms and lower leg than upon the trunk, upper arm and thighs—armpit and grom comparatively free. Extensor surfaces more involved than flexors

ment will not be influenced either by the susceptibility of the patient or by the strain of the disease"

We here present two additional pairs of diagrams to illustrate this most important of all differentiating points between these two diseases,

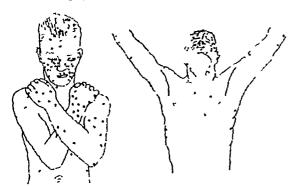

Fig. 3 Distribution of the eruption of smallpox in the 'folded up" and 'opened up" positions of the arms

namely, distribution These diagrams, also, have been reproduced from the California Board of Health Bulletin we have previously mentioned

It will be noted that in each pair of diagrams the patient is shown in two positions, which we will designate as "folded up" and "opened up". In the first or "folded up" position, the arms are crossed over the chest, the hands resting upon the shoulders, with the head bent forward. Note the

extent of eruption visible in the first or "folded up" position in both diagrams, and remember that the "protected" areas are covered, and that the face, extensor surfaces, and outer arm surfaces are exposed to view

Now, compare the second or "opened up' position in the two diagrams, in this position the

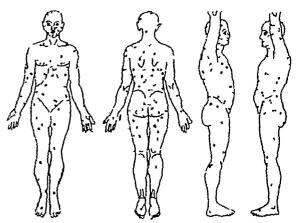

Fig 2 Distribution of Chickenpox Eruption. Note that the distribution in chickenpox is just the opposite of smallpox—more profuse upon the trunk, upper arms, and thighs, than upon the face, lower arm, and lower leg There is less of a tendency toward symmetry in chickenpox

arms are extended upward and the head thrown well back. The "protected" areas are exposed, while the outer and extensor arm surfaces are hidden from view and the face is less readily seen. It will be noted that in order to best expose the eruption of smallpox, the protected areas

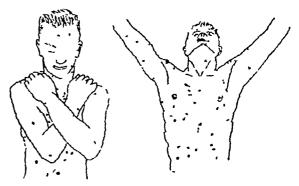

Fig. 4 Distribution of the eruption of chickenpox in the folded up" and 'opened up" positions of the arms

particularly the axillae and the inner surfaces of the arms, can be covered without much sacrifice, for smallpox shuns these areas as well as the chest to a great extent

But in chickenpox, it is necessary to use the "opened up" position to best exhibit the eruption, for this exposes the axillae, inner arm surfaces and the chest, areas preferred by chickenpox

All of the other differentiating features are sec-

ondary to the foregoing, and we will consider some of them in the order of their relative values This order is as follows

General appearance of the eruption, Area where eruption first begins, Growth of individual lesions, History of the case

General Appearance of the Eruption—In emallpox it will be noted that the lesions in any one area are practically similar in size, in shape (strong tendency to a circular outline), and in age

In chickenpox the lesions in any one area differ to a considerable extent in size, in shape (tendency to irregular outline, frequently oval), and in age (as shown by new lesions, fully developed ones, and crusts, frequently in close proximity)

Area Where Eruption First Appears—Small-pox usually appears first on the face Chicken-pox usually appears first on the trunk

The determination of this factor need not depend altogether upon statements of the patient,

Fig 5-Smallpox, Typical Distribution

but can be determined to a certain degree by comparing the apparent age, as shown by the stage of development of the lesions on the face and on other parts

Growth of the Individual Lessons—Smallpox lessons are slow in passing through the various stages of evolution,—requiring several days, in most instances

Chickenpox lesions, on the contrary, are rapid in their development

History of the Case —This should be the last feature of the evidence to be considered, and it should not be given the weight frequently as-

cribed to it It is true that smallpox very frequently has a prodromal period of about three days of illness before the appearance of the eruption, but the same history is sometimes present in

Fig 6—Chickenpox eruption, natural size, showing variability of lesions

chickenpox On the other hand such a history is sometimes absent in smallpox

In the last two or three weeks we have seen, in consultation with health officers and attending physicians, two clear cases of chickenpox in both of which, there was a history of prodromes

It is perhaps unnecessary to state, in view of what we have said in the foregoing, that every case of eruptive disease in which a diagnosis of chickenpox is considered, should be given the most careful scrutiny

In this connection, never ask a patient, "Have you had chickenpox?" but put the question, "Have you ever had chickenpox before?" This is in consideration of some of the frailties of human nature

Some Points of No Relative Value

Umbilication —This should not be considered at all, for it may occur in either disease, or it may be absent

"Shottmess"—Should be left out of consideration for the same reasons, and because of mistakes in determining its presence or absence

Secondary Fever — Not liable to occur in the present type of smallpox, and fever may be present during the eruptive period of chickenpox

THE OCCUPATIONAL DISORDERS OF THE NEW YORK PUBLIC SCHOOL CHILD*

By WILLIAM ROSENSON, MD, NEW YORK, N Y

REVENTIVE medicine is slowly, but definitely advancing over an ever widening sphere of activity The most fertile field for its development must be conceded to be the domain of childhood The New York public school system with an enrollment of more than a million pupils under supervision during a large part of the day, offers an unusual opportunity to put into practice on a large scale the mandates and methods and spirit of preventive medicine Already much has been accomplished Pre-school vaccination against small-pox, the general application of the Schick test, and toxin-anti-toxin for immunization against diphtheria, have taken firm root in the school regime Periodic physical examination for the detection and correction of remedial defects is becoming more intensively applied The formation, and extension of the special classes for the handicapped children, the cardiacs, anemics, markedly under-nourished, the mentally defective, poor visioned, and the physically crippled have done much to alleviate the afflictions of many children, and in some instances to prevent further progress of the pathological processes Complete restoration of health has been attained in some cases

There are, however, a number of conditions, methods, and mores still extant in the school system, and here I shall confine myself to the elementary grades, which have a tendency to produce definite physical and mental disorders, 'occupational disorders," if you please, among the children My attention was emphatically called to this subject about two years ago, when during the course of a single week, four cases of this type were seen. The first, a girl of eight was brought to me because of abdominal pain and vomiting These symptoms became manifest only after lunch, and on the way back to school for the afternoon session further questioning it was learned that her home was nine blocks from the school, and that the time alloted for the regular lunch period, fifty minutes, from twelve noon, to twelve-fifty, was entirely insufficient to allow more than a few minutes for eating the lunch As a consequence, she veritably raced home from school, gulped the food, hurriedly attended to her necessary wants, and continued on her marathon back to school to make the twelve-fifty gong Her journey was frequently interrupted by an attack of upper abdominal pain, and emesis The symptoms often continued during the afternoon They rarely occurred on Saturdays or holidays Physical examination was negative

The second case, a boy of seven years was seen at home He had a temperature of one hundred and four, with all the symptoms and signs of an upper respiratory infection When I first entered the sick room, the boy vociferously demanded that I permit him to return to school at once Not understanding the violent outburst, I turned to the mother, who informed me that there was an inviolable rule in his class that absence from school, no matter what the cause, would mean that the boy would be placed in the row with the pupils of poor scholastic standing, with the "dumbells" as he expressed it. He was an unusually bright and ambitious child, and the thought of this punishment produced a mental anguish which could not but retard the favorable progress of his condition Moreover, he had confessed that two days previously he had been chilly and achy, but cloaked his symptoms, and continued to attend school for fear of the degradation which would follow his absence

The third and fourth cases seen at the time were quite similar, and typify a large group of cases. These were children who suffered from marked fatigue. The symptoms were anorexia, pallor, irritability and restlessness. They were overtired, worn-out, over-burdened and unhappy. The rush of regular school work, two to three hours of assigned homework, carrying a load of heavy books to and from school, and up and down three or four flights of stairs several times a day, was evidently undermining their health

During the past two years since these cases were, so poignantly brought to my attention I have taken school histories of patients in an endeavor to learn the factors surrounding school life which have a bearing on the child's well being. A personal inspection of a number of schools, and talks with intelligent parents and teachers have assisted me materially in the formulation of the subject.

THE LUNCH PERIOD

The recess for lunch is fifty minutes. This includes the time required to leave the school building, to travel home and back to school, to eat lunch, to attend to necessary wants, and in walking to guard against street accidents by watching the traffic carefully, and traffic signals. As a consequence, the child either eats an inadequate lunch, or gulps a sufficient meal. The nervous strain attendant upon this rush frequently causes a lack of appetite, and fatigue. If the

Read before the Medical Society of the County of New York, at the New York Academy of Medicine December 23 1927

ondary to the foregoing, and we will consider some of them in the order of their relative values This order is as follows

General appearance of the eruption, Area where eruption first begins, Growth of individual lesions, History of the case

General Appearance of the Eruption—In mallpox it will be noted that the lesions in any one area are practically similar in size, in shape (strong tendency to a circular outline), and in age

In chickenpox the lesions in any one area differ to a considerable extent in size, in shape (tendency to irregular outline, frequently oval), and in age (as shown by new lesions, fully developed ones, and crusts, frequently in close proximity)

Area Where Eruption First Appears —Small-pox usually appears first on the face Chicken-pox usually appears first on the trunk

The determination of this factor need not depend altogether upon statements of the patient,

Fig 5-Smallpox, Typical Distribution

but can be determined to a certain degree by comparing the apparent age, as shown by the stage of development of the lesions on the face and on other parts

Growth of the Individual Lesions—Smallpolesions are slow in passing through the various stages of evolution,—requiring several days, in most instances

Chickenpox lesions, on the contrary, are rapid in their development

History of the Case —This should be the last feature of the evidence to be considered, and it should not be given the weight frequently as-

cribed to it It is true that smallpox very frequently has a prodromal period of about three days of illness before the appearance of the emption, but the same history is sometimes present in

Fig 6—Chickenpox eruption, natural size, showing variability of lesions

chickenpox On the other hand such a history is sometimes absent in smallpox

In the last two or three weeks we have seen, in consultation with health officers and attending physicians, two clear cases of chickenpo in both of which, there was a history of prodromes

It is perhaps unnecessary to state, in view of what we have said in the foregoing, that every case of eruptive disease in which a diagnosis of chickenpox is considered, should be given the most careful scrutiny

In this connection, never ask a patient, "Have you had chickenpox?" but put the question, "Have you ever had chickenpox before?" This is in consideration of some of the frailties of human nature

Some Points of No Relative Value

Umbilication —This should not be considered at all, for it may occur in either disease, or it may be absent

"Shottiness"—Should be left out of consideration for the same reasons, and because of mistakes in determining its presence or absence

Secondary Fever—Not liable to occur in the present type of smallpox, and fever may be present during the eruptive period of chickenpox

plained that she had two hours of homework to prepare for the following day These are hours that no adult would tolerate, except perhaps the

physician

There are no definite regulations governing the amount of homework a child may receive. In some classes and schools it may be one hour, in others for the same grade it may be three hours, depending on the discretion or indiscretion of the teacher or teachers. I have found that when a study period is scheduled for the following day, additional homework is frequently assigned, and occasionally that study period itself is employed by the teacher for other purposes. Homework should not invade the child's inherent right to its share of sunshine, fresh air, and play. It should be so regulated as not to occupy more than 1/2 to 11/2 hours at most depending on the age of the child.

SUPERVISION OF LAVATORIES

In the school regime the most unaesthetic subject is that of the childrens' lavatories. So unaesthetic, and uninteresting is the topic that it seems to be in many instances the most neglected part of the school system. The lavatories are often filthy, inadequately flushed, surcharged with an ammoniacal odor, and without toilet tissue. I know a number of children from homes of good standards who find it impossible to use the school lavatories, and frequently suffer unnecessary discomfort, and pains. Constipation sometimes ensues.

Furthermore, there is no protection from intruders. No matron is stationed in the girls' lavatories, no porter in the boys'. I know of one instance in which three little girls were attacked in the lavatories, another in which a strange man was found prowling around the girls' lavatory.

Accompanied by a social welfare worker I inspected the conditions closely in five schools, and

shall sumarize each briefly

School A Old building, lavatories are outhouses, approach to them is through open yard, no covering overhead, and when visited we saw children going through the indoor yard of the building which was heated into the outdoor yard without overclothing, and the day was snowy and damp. The boys' and girls' lavatories were adjacent to each other. No other lavatories for the children in the entire building. The lavatories themselves were scrupulously clean, but the seats were old-fashioned, and made of soft wood. There was no tissue paper, and no facilities for washing the hands.

School B This building fairly new The lavatories are in an outdoor yard, but the approach is covered Plumbing fairly modern There was one roll of tissue paper chained to the wall There was excreta on the floor No facilities for washing the hands. There was no supervision of any kind. We went into the lavatories

without permission, and came out without being observed by anyone, although the entrance to the school building is through the ground floor yard Malicious persons can easily enter. Only other lavatory on the top floor (5th). Girls' and boys' lavatories separated.

School C This is a very large building having five floors There is no girls' lavatory between the cellar and the top floor The approach is through a very large playground This is dark. The lavatory for the girls is at the extreme end of the yard There is a strong ammoniacal odor Inadequate flush, and no facilities for washing the This school is in a congested neighborhood, and has a large share of delinquents who may enter the building, and be attracted by the dark cellar lavatory The lavatory is never locked because there is an after school recreation center. and there are actual instances in which older boys have been found in the girls' lavatory after school The boys' lavatory is in the playground, and is more adequate. There is a small antercom leading from the lavatory. It is secluded, and under no supervision Boys playing crap were found in this antercom

School D This is a new building with adequate provision throughout for the boys and girls They are entirely separated, are clean, light and sunny No facilities for washing the hands

School E New building with most modern plumbing The boys' and girls' lavatories, however, are adjacent, and it was in this school that the case mentioned previously in which an older boy induced two younger ones to enter the girls' lavatory and attack three little girls, the oldest 9, and the youngest 7 The oldest boy was subsequently sent to a protectory

There is then in some instances a very serious lack of supervision of the childrens' lavatories While the children are being taught the elements of cleanliness, hygiene, and sanitation in the classrooms on the upper floors, no attempt is made to provide them with soap, water, and towelling in the lavatories on the lower floor, to carry out the first principles of their teachings dren of the ungraded classes use the same lavatories as the normal children, and yet it is well known that these children are apt to display habit traits which make it undesirable for them to associate so closely with normal children under no For the sanitary, physical, and supervision moral well being, and protection of our city's school children there should be stationed a porter and a matron in the boys' and girls' lavatories respectively

THE SCHOOL HOURS

Of equal importance is the question of school opening. Under the double session regime, it is a frequent occurence to have six and seven year old children in the early session which necessitates beginning school at 8 10 A. M. During the

child attains the high distinction of being appointed monitor, then his recess must needs be curtailed by at least five to ten minutes

I was interested in the attitude of other cities toward this problem. In 1925 I sent a questionnaire to the Boards of Education of the ten largest cities of the United States ranking next in population to New York, and received the following replies regarding the time alloted for the lunch hour

Chicago—1 to 1¼ hours
Boston—1¼ hours
Philadelphia—1½ hours
Pittsburgh—1 hour to 1¼ hours
St Louis—1 hour 10 minutes
Baltimore—1¼ hours
San Francisco—1 hour
Detroit—1¼ hours to 1½ hours
Cleveland—1½ hours
Los Angeles—1 hour

New York allows fifty minutes for its children's lunch, the shortest period of any large city. The time alloted for the recess should be at least one

and one quarter hours

A number of schools have a double session The early session is dismissed for lunch at 10 50 and the children must eat their mid-day meal at about 11 A M This is rather an early lunch hour. If, however, after an interval the habit of eating an adequate meal is developed at this time, this habit must soon be substituted for another, because the following term, the same child is likely to be placed in the later session. These frequent changes interfere with our attempts to inculcate proper feeding habits. An endeavor should be made to keep the same schedule for several terms.

Another question, that of the school lunch has been fully studied by the School Lunch Inquiry Committee, a body organized at the request, I believe, of the superintendent of schools, and including representatives of various civic associations, and the Public Health Relations Committee of the Academy of Medicine The committee, the School Lunch Inquiry Committee, found that "indiscriminate, and often unhealthy food" was being served to the city's school children by an "objectionable concessionaire system" and recommended that provision be made for the appointment of an "assistant director of homemaking to operate school lunches" Their fine effort should be enthusiastically supported

On one occasion, while visiting a school lunch room, when in full operation, I was surprised to see that a large proportion of the children on line were placing two cups of cocoa on their trays. Not understanding this general enthusiasm for cocoa, I investigated, and found that each cup was but one-half full, and on inquiry, I learned that though seemingly a cup of cocoa was sold to the children, they had to invest in two cups of cocoa in order to get one cupful. Such an arith-

metical problem could be demonstrated only in a school children's lunch room

THE PROBLEM OF ATTENDANCE

Regular attendance at school should be en couraged, but when that atendance is emphasized as the paramount goal to be attained by any and all possible means, it may become subversive to good health In some schools the attendance is made the object of keen competition between the classes, and a large placard marked 100% is dis played on the door of the classroom that has no child absent during a designated period. If a pupil of that group should be so inconsiderate as to develop a bronchitis or a gastro-intestinal dis turbance, the class loses its pre-eminence. On the child's return, he is sometimes disgraced by being seated in the last row The child with a keen sense of loyalty or of fear is apt to disregard or conceal early symptoms, which may later prove to be serious This has occurred in three of my cases.

There is a type of child that readily contracts an upper respiratory infection. In unusually in clement weather such a case is undoubtedly better at home, and should be unquestionably excused from school. In the course of the term if this precaution were observed, the child's total absences would be fewer. A child with a mild upper respiratory infection, with coryza and possibly cough should remain at home for a day or two, especially in wintry weather. The emphasis on the 100% attendance record often brings a child to school, only to intensify his own symptoms, and to spread the infection among his class-

mates

Regular attendance is important, but it should not be made educations' chief raison d'etre.

SCHOOL WORK AFTER SCHOOL HOURS

The child's work day does not end with the close of the school hours. At times he is "kept in" after school as a punishment for some misdemeanor, more or less grave. This leaves less time for his outdoor exercise. Moreover, the traffic officer is no longer on duty at the corner to guide the child safely across New York's memacing avenues. This hazardous form of punish ment should not be condoned.

Since 1916 there has been a state law, the Welsh Law, requiring 200 minutes a week of physical training and games, and hygiene education. Some schools, not finding it convenient to include this work within the regular hours, added two hours to one day of the week, thereby extending it until five in the afternoon. Recently I was called to see a girl of eleven who returned from school at 5.15 in the afternoon, complaining of headache, pains in the legs, and feeling "all in". There was no fever and the physical examination was negative. This was undoubtedly a case of exhaustion. I ordered her to bed, but she com-

view point. For the last year and a half at least I have sought to arouse public attention to deal intelligently with the problems that have been broached by Dr. Rosenson tonight

There are children who are of the rugged, hardy type, who, like pack-horses, can endure heavy burdens without showing any ill effects. On the other hand there is a vast army whose number cannot even be roughly estimated, who are hyper-sensitive physically and mentally, and who react in a very marked way to psychic or physical insults.

Dr Rosenson has spoken of cases of tic that he has observed in children having a sensitive nervous system. I make bold to state that uside from the dramatic instances in which a tic or chorea give evidence of mal-adjustment between certain school children and their teachers and the educational environment, there are multiplied instances in which effects that are far reaching are produced upon a child, but not in ways that declare themselves so dramatically

The current hustle and bustle that dominates the lives of adults is bad enough, and often without adequate basis or explanation, but it becomes infinitely worse when the psychology of hurry and rush affects the lives of chil-While I realize that many individuals tend from birth to belong to the high-strung nervous type, the school ought not to aggravate such tendencies, but, on the contrary, under the guidance of psychologists, neurologists and educators as well as public health officials, it should study to counter-balance these unfortunate tendencies As things stand today, not only the child's sensitiveness, but that of every one in the home practically, is aggravated by the compulsion to rush, the tenseness of the home atmosphere and general irritability which characterizes not only the school child of tender years, but the mother and the others who may in some way or other catch the contagion of this mischievous and subversive in-I am certain that hurry and rush at meals account for more mal-nutrition among the rich and poor, than is accounted for by ignorance as to the proper dietary, by lack of parental control, or by coddling and other personal factors A child simply cannot eat enough, even before the school hour starts, if it is distracted by a thousand and one things that may appeal to its curiosity, and cause the loss of just a few minutes of time, or if it must rush to make up for failure to awaken early, if schools are far distant and if other such factors exist Who knows but what the gastric disorders that plague an army of young persons and adults may not have been aggravated, or had their origin, in the rush that possesses so many during their school career . I am an admirer of the ways of the people in

foreign countries who enjoy living and who make an art of life, rather than hustle and bustle to serve the god of utilitarianism. Our young children of between six and ten years of age are "career people" and are the victims of a Procrastean curriculum.

From my conferences with Dr William J O'Shea, the Superintendent of Schools, I have learned that he as well as a number of leaders in the educational system of the city, see clearly and fully the disadvantages of the present system to children, teachers and parents in so far as hours and conditions of work are concerned, but we must have an enlightened and popular sentiment to support a radical departure in the methods that obtain at present In my various speeches I have ventured to make certain revolutionary suggestions knowing that I voiced the general feeling of Dr O'Shea and those who are associated with him in the direction of our educational system

For practically all children up to the age of thirteen years I would insist upon a single period of daily instruction lasting three to four hours, according to age Such a period of instruction should include an opportunity to do the home work that may be necessary to bring out the individual resourcefulness and initiative of the child and to make it more familiar with newly imparted instruction It would make it possible for children, who may have missed the point of an explanation, to make known their failure and to be assisted before they are confirmed in their errors with a clear recollection of my own difficulty so far as mathematics was concerned, I am sure I would not have been so poor a student in mathematics, making the grade only by the skin of my teeth, if I could have stopped to ask questions during a study period with respect to some point where the explanation was less clear to me than to other students, even though it might have offered me a career as a bookkeeper and diverted me from public health work But it would have been a wonderful exhibition of a system, not yet in vogue, which is based on tolerance, patience and resourcefulness of the teaching staff, and of the encouragement to question one's teacher, and to allow time for this personal relationship to I am firmly convinced that be developed single periods of instruction for children in public schools, even those in the higher grades, would not add to the number of morons, nor diminish from the sum total of achievement of those who are a product of the public school With a single session per day there would be time for outdoor recreation and some of it could be organized and directed by teachers who have specialized in this field of work, so as to carry over the educational influence in character-building through play and to premidwinter months it means for them arising in the dreary cold darkness of a yet unheated apartment, often partaking of a rapidly prepared and scanty breakfast, and journeying to school shivering through a frigid, semi-darkness. Such hours for the youngest element in the school are unquestionably subversive to good health. If double sessions are here to stay for a while as they seem to be, a serious effort should be made to keep the youngest children, of the first and second years, in the late session

MISCELLANEOUS FACTORS INFLUENCING CHILD HEALTH IN THE PUBLIC SCHOOL

In schools with a double session, children are frequently compelled to keep their clothing with them during overlapping periods. As a consequence, they either keep their clothing on in the heated classroom, which encourages catarrhal respiratory infections, or they sit on them which is unsanitary, uncomfortable, and unhealthy. Some provision should be instituted for the correction of this most unusual procedure

The subject of the overcrowded classroom and its deleterious effect upon both the children and the teachers has been frequently stressed irritable and nervous teacher, the product of the harassing problems presented by the large classes has a very potent influence on the nervous system of the child Its mental well being, its attitude, and outlook so often reflect the spirit of the teacher I have seen tics come and go with the change of the teacher With the advent of a new teacher I have seen ırrıtable, tıred, morose, and unhappy children become spirited, alert, uncomplaining, and happy Few teachers can maintain an even disposition and cheerful outlook with fifty youngsters of varying temperaments, often presenting fifty different problems Smaller classes would be desirable, a maximum of thirtyfive as the ultimate aim

The educational authorities are cognizant of the overcrowding and difficulties presented by "mass' education. They are endeavoring to build as many new schools as the public appropriations will permit. Newer and more efficient methods in education are being introduced to meet more adequately the needs of our modern youth. The high scholastic standards should be supplemented by equally high standards of living, of health, and

recreation To best attain these ends the con siderations of problems of child health in the public schools should be left entirely to medical men, and their decisions should be final. A commission including a public health worker, a pediatrist, a psychiatrist, and a general medical man with the Commissioner of Health as chairman, should be entrusted with this important task

The program outlined here for the prevention of "occupational disorders" in the public school child does not in its major part call for an elaborate reorganization, or a large outlay. It includes in brief the following suggestions

(1) Increase of noon recess from the present fifty minutes to one and one-quarter hours

(2) For school lunches the manguration of the program presented by the School Lunch Inquiry Committee

(3) The question of the attendance to be treated on a more rational basis

(4) The "keeping in" of school children after school hours to be eliminated

(5) Regulation of homework so that no more than one-half to one and one-half hours be required depending on the age of the child

(6) Proper supervision of school lavatories with a porter and matron stationed in the boys' and girls' lavatories respectively Facilities for washing the hands to be provided

(7) Reduction of the school hours for the

second to the first year schedule

(8) In the double session schools, children of the first and second year to be placed in the late session

(9) Provision to be made for the closeting of

childrens' clothing at all times

(10) Smaller classes, maximum register to be

thirty-five

(11) The establishment of a commission of physicians to pass on all matters concerning childrens' health in the public schools

In the industrial world during the past decade great strides have been evidenced in making the conditions and environment of the worker more sanitary, more healthful, more comfortable, and happier Certainly, this the greatest of cities should do no less for its future citizenry. The way for the extension of this field in preventive medicine should be paved by the organized medical profession.

DISCUSSION

By LOUIS I HARRIS, M.D., NEW YORK, N. Y Commissioner Department of Health City of New York

THE subject presented by Dr Rosenson has a greater medical importance than may appear at first sight. I have ventured to dictate the following comments because I am exceedingly anxious to lose no chance to give an

impetus to public consideration of this question that will take it out of the realm of mere academic discussion

It is well that this important subject should be discussed from a medical and public health

limit. The diastolic pressure is usually 40-60 mm Hg below the systolic, and the difference between the two is spoken of as the pulse pressure. It is pretty well agreed that every dia stolic pressure above 90 should be considered pathological, also high diastolic pressures are more serious than high systolic pressures from a prognostic point of view

Etiology—The exact etiology of this disease is unknown, but may be divided into primary Of the primary causes, and secondary factors heredity and infection are most important They have been discussed by Allen,8 also by Gibbs and Sprunt The individuals actually inherit not hypertension, but a vulnerability to the disease, and they have a more susceptible cardio-vascular system than the average The other necessary factor is infection or intoxication, either acute or in chronic foci such as the teeth, tonsils, sinuses, appendix, gallbladder, etc. Gibbs¹ found focal infection in 96% of his cases, and Post and Steiglitz2 name numerous possible origins showing the futility of attributing it to any one factor spite of Rosenow's work on the predilection of the organism, we cannot explain why one person responds to those infections with hypertension, another with nephritis or diabetes

The secondary factors may be discussed under diet, particularly protein and salt meta-There has been considerable work done on this phase of the etiology, both clinically and experimentally The German investigators, particularly Schmidtman, Antischkow,7 and Monckelburg,8 by their experimental studies have concluded that cholesterol is responsible for the arteriosclerosis in experimental animals, such as rabbits, guinea pigs and Newburgh in his experiments has shown high protein diets to be the cause Nuzum¹⁰ and his co-workers also concluded that an excessive protein diet over a long period of time caused a disturbance of the acid base balance, resulting in the excretion of very Strouse and Kellman's work has apparently disproved that of Newburgh and Nuzum

Major^{10 20 21} in his experience with guandine bases has shown the potent pressor action of these substances which are normally present in the blood, tissues and urine as end products of purin metabolism. He has demonstrated the mechanism of their action on the nervemuscle structure of the arterioles, and indicated their retention in clinical cases of hypertension and their increased elimination as the blood pressure falls under treatment

Pathology—The pathogenesis in the production of high blood pressure remains doubtful, because a patient never dies of early hyper-

tension and in more advanced cases the invariable occurrence of lesions in the small blood vessels is still disputed In advanced sclerosis of the large arteries the blood pressure may be normal There are three stages of high blood pressure according to Volhard the early or pre-sclerosis stage, histologically and pathologically unknown At this stage the process may be halted or controlled, as we have only transitory increases in blood-pressure and there is no organic pathology present (2) The next stage is that of permanent hypertension and cardiac hypertrophy, often associated with sclerosis and hemorrhages of the Here there may be practically retinal vessels no impairment of kidney function (3) One form of termination is in malignant sclerosis, the result of a progressive kidney impairment The patient often dies in uremia, and the autopsy shows a primary contracted kidney Fishberg¹² in 72 cases of essential hypertension coming to necropsy found lesions of the terminal arterioles, and in every instance the minute arterioles of the kidney were affected He suggests that essential hypertension may be due to a disorder of renal function the other hand Albutt 13 has presented evidence that the renal lessons follow rather than antedate the increase in the blood pressure is further supported by Anderson¹⁴ who found that removal of 70% of the kidney tissue in rabbits does not produce hypertension even when prolonged and accompanied by evidence of renal insufficiency. Reid 15 also infers that the atrophy of renal tissue in chronic glomerulonephritis is not the cause of the accompanying hypertension Kylin¹⁶ believes hypertension is due to a disease of the vasomotor part of the vegetative system and may affect any one of its components. There are strong reasons for accepting the Volhard-Fahr view that a persistent spasm in the small arterioles followed by anatomical changes of loss of elasticity can later cause a partial or complete obstruction of the small vessels. It is not uncommon to find a thickening of the intima due to a proliferation of endothelium, the latter is usually a secondary change due to the in-Allen 18 has shown creased blood pressure that a rise in blood pressure may be due to a change in the salt and water metabolism and he has been able to reduce the blood pressure by the use of a strictly salt free diet Hypothetically, he suggests that the sodium chloride may be responsible for edema in the endothelium or contractions in the small vessels

A search through the numerous articles on hypertension in the attempt to find a mode of treatment that will actually control the condition is in vain. There are only the temporary measures mentioned, such as nitroglycerine, potassium iodide and calcium. All are agreed

vent many of the accidents that occur daily The method I propose would eliminate the concessionaires whose existence at best is made necessary by an archaic industrial system of excessive hours, overtime work, and home labor in the educational realm

Aside from the influence of the present system upon the development of various nervous disorders and diseases or of unfavorable effects upon personality, as well as upon the gastric system, we must consider that these factors together with malnutrition that arises out of the same causes, create a lowered resistance to various diseases, and this is important not only for children of very tender age but quite as much so for the girls who are approaching puberty

If the sanitary standards for lavatories and toilets with respect to their accessibility, as well as their construction, equipment and the privacy they afford, were as well organized in the public schools as they are in industrial institutions that are progressive, children would have no cause for complaint or be endangered Of course toilets ought not to be placed in an out-house or a building separate from the main structure, but treated as they are in industrial establishments, so that there are separate divisions for both sexes on practically every floor of the building, which may be supervised and watched so as to protect the children from intruders

I am hoping for the day when there will be a home visiting teaching service that will take care of those forced to be absentees due to sickness so that children will not feel under constraint to go to school when they are below par or have symptoms of beginning disease It might also serve very greatly to help certain

children keep abreast of their fellows without compelling them to go to school at all for periods of several weeks at a time, depending on home visiting instructions, which can be made brief and to the point when applied to a single child, and which would permit children who are handicapped from a nervous or physical standpoint to slow up in the race and keep abreast of their fellows. I have no time to elaborate this thought

Just as I am unalterably opposed to home work for children in all elementary schools, so I am even more opposed to keeping school children in after hours

Only partial safety channels are maintained by the police in the morning, during the noon hour and after school. Either there ought to be an even greater body of police assigned to make safe channels for the passage of children through traffic during all hours of the day, in structing the children on how to profit by these guarded channels, or else teachers or older children with a sense of responsibility should guide them home

As to sanitary conditions with respect to wardrobe, the methods of sweeping and even the size of classes, much might be said that is obvious and necessary but that would take us far afield. I make bold to say that if all the County Medical Societies would maintain an active campaign that would manifest the interest of the medical profession in the important preventive problems that Dr Rosenson has suggested, there would be a change effected in public sentiment which would inure greatly to the benefit of teachers, especially to the benefit of pupils, and last but not least to the mothers

ARTERIAL HYPERTENSION AND ITS TREATMENT

(With Report of 212 Cases)

By SAMUEL A VOGEL, M D, BUFFALO, N Y

I T is justifiable to assert that there is no general agreement as to the cause of high blood pressure, and even greater confusion reigns concerning the treatment

We know that the normal blood pressure varies in individuals according to age, sex, occupation and individual peculiarities and also undergoes fluctuations during the day, somewhat like body temperautres. It is lowest while at rest, particularly during sleep, and temporarily higher during hard exercises or excitement. Also a heavy meal may cause a

considerable rise of pressure, therefore in hypertension cases there is sometimes a stroke following a heavy meal. The old saying that one's systolic pressure should be 100 plus the age cannot be true and only holds incidentally in some cases, for example, the new born in fant has a systolic pressure of 80-90 mm. Hg while the pressure of a person eighty years old should not be 180. The systolic pressure rises with increasing age and in the normal adult is between 110-140 mm. Hg. At later ages it may be slightly higher, but 140-150 mm. Hg. may perhaps be called the upper normal.

^{*} From the Psychiatric Institute Morristown N J

number 94 were reduced more than two kilograms Of those who were not reduced only 39 improved In the cases associated with nephritis there was an almost equal number of improved and unimproved cases and the influence of weight reduction was less evident The majority of obese persons do not have high blood pressure, and it cannot be said that a reduction in body fat will necessarily reduce blood pressure, though its influence is usually favorable to some degree But it is reasonable to expect that where there has been a salt and water retention associated with a certain amount of edema, particularly of the invisible type, the loss of several kilograms in weight, a great deal of which was probably water, will commonly be accompanied by an improved circulation with direct benefit to the hypertension and its associated symptoms

CHANGES IN PLASMA CHLORIDE CONCENTRATIONS

The statistics in this table are variable, prob-

that did not improve, there were almost twice as many men as women, and the greatest number of unimproved males were among the hypertensive cases with nephritis (19 of the 36). I have counted as improved only those cases that had a drop of at least 20 mm. Hg for several days before leaving the Institute, and were practically free of symptoms.

A number of these patients have been seen several times since leaving the Institute, and when the diet has been faithfully continued the blood pressure has either remained at the same level as on leaving the Institute, or in many it has fallen lower. In the small number whose pressure has risen to a higher level, departure from diet has been proved by urinalyses and confessions. Allen, in his large series of cases published in October, 1922, comprising hypertension cases followed for 1 to 5 years, has shown that when the pressure assumes a lower level, and the patient remains on a strict diet, the pressure in nearly all cases will remain at

TABLE D

ably on account of variations in the chloride equilibrium between blood and tissues. From a prognostic standpoint the cases with high chlorides are more favorable on the average than those with low chlorides. The exceptions, also the irregularities in the rise and fall of chlorides under treatment, must be attributed to known and unknown factors which space will not permit discussing here

TABLE E
RESULT OF TREATMENT AT INSTITUTE

		Improved		Uni	mprove	ď
	31	. 1	Total	М	·F	Total
Chl above 580	23	48	71	5	7	12
Chl below 580	29	26	55	12	8	20
With Neph	18	12	30	19	4	23
Grand Total	70	86	156	35	19	55

Results of Treatment—As mentioned above, only those cases were included in this series, which received treatment in the Institute for at least two weeks. A few patients remained for as long as six weeks, but the average length of stay was about three weeks. Of the total of 212 cases, 156 were demonstrably improved, viz., 70 men and 86 women. Among the 55

the lower level permanently. We have also seen a number of the so-called unimproved cases of the series improve at home after several months of careful diet. In all instances the relief of clinical symptoms has corresponded to the fall in pressure or has been even more marked.

Treatment—The treatment consists essentially in a salt-free diet, which means not merely the removal of salt from the table, but the most rigid elimination of salt from the diet by the use of food having a low chloride content and by special preparation of the food. The patient's fidelity to such a diet depends largely upon the knowledge and imagination of the dietitian or cook in substituting various seasonings to replace the salt. It is important for a patient to begin treatment in an institution with the requisite dietary and laboratory facilities, for obtaining the best initial results and for instruction in continuing the treatment at home

SUMMARY

This paper summarizes the results of 212 cases of hypertension treated in this Institute since the previous report by Allen The same classification was followed and the therapeutic

Male

Female

that rest will lower the blood pressure but admit that with the return of the patients to activity the blood pressure returns to its original high level. Venesection has been used since an early time and is still of value as an emergency measure for temporary reduction. Recently a considerable amount of both experimental and clinical work has been done with liver extract. In our hands the liver extract preparations that are on the market have proved worthless.

Although Mosenthal and Short²² say that there is no definite evidence in the literature that sodium chloride raises blood pressure, and that the level of the blood chlorides bear no relation to blood pressure, their actual clinical findings are unconvincing. It may be suggested, perhaps, that they did not keep their patients on the diet for a sufficient length of time, and in some instances the patients seemed to show a beginning response at the time when the experiment was discontinued Kylin²³ and a number of others advocate chloride restriction, and other literature has been reviewed by Allen

In the paper mentioned, Allen described the results of salt-free diet in 180 cases observed over periods of several years. In the present paper, we are enlarging this series with 211 cases subsequently treated in the Physiatric We have included only those pa-Institute tients who remained in the Institute for at least two weeks, and the average length of stay was about three weeks Only those cases are included that had shown persistent systolic blood pressures above 160 mm Hg and dias-The series would tolic pressure above 90 have been much larger, had all slight or transitory elevations of pressure been included The great majority of cases in the series were severe and unfavorable from a prognostic standpoint, for not only were the systolic pressures mostly above 200, but also the patients had generally been referred by physicians after various attempts at reduction of pressure

Following the empirical classification of cases employed by Allen, this series was divided into the following four groups

- A. Cases of pure or "essential" hypertension with initial plasma chloride concentration above 580 mg per 100 cc of blood
- B Cases of hypertension with initial plasma chloride concentration below 580 mg per 100 cc of blood
- C Cases of hypertension with nephritis
 The word "nephritis" is used here to
 indicate a renal lesion as shown by an
 impairment of nitrogen excretion

D Cases of hypertension with diabetes These cases because of their special peculiarity will be reported in a later paper

DISCUSSION OF TABLES A AND B

Set—The consensus of opinion, not only among the medical profession but also among the laity, is that by far the greater number of hypertension cases occur among males. This is probably traditional because of the more frequent examinations of men and has been attributed to the greater use of alcohol and the heavy work by men. This series of cases proves this prevalent opinion erroneous as far as our experience extends, there were about as many males as females (105 and 107 respectively), although the hypertension cases with nephritis were twice as numerous in males as in females

Decade of Life—This analysis based on the age at admission, not at the onset of the trouble, shows the well known higher includence in later life, the greatest number in the fifth decade and the next highest number in the fourth decade. Contrary to the supposition that hypertension in women is brought on by the menopause, there are more men than women with hypertension during the fourth and fifth decades. The cases occurring in the second and third decades fortunately were few, as they are more resistent to treatment, and the prognosis is worse.

TABLE C

Reduced more than 2 kg	46	2	35	14	19	14
2 Ng						

Body Weight —Of the patients that improved, 114 were reduced in weight, and of this

One of the outstanding points of interest is the time in hours that the disease had progressed before they were seen by the surgeon In 155 cases -more than half of the total number-more than 36 hours had passed before surgical aid was The fact that the mortality rate and the morbidity rate increases in direct proportion to the delay in operating acute appendices has been brought before the profession so many times that it seems almost superfluous to mention it again, and yet, the figures as shown in this group would indicate that either the public or the physicians, probably both, do not yet fully appreciate the importance of early operation. I know that in many of these cases the physicians are in no way responsible Often, they are not called in to see the s ck patient until very late and occasionally the patient or his family refuse to act upon the advice of early operation On the other hand, the doctor may be at fault in not presenting his advice in a sufficiently convincing manner This personal equation must enter into the situation for we have repeatedly noticed that there are some physicians who seldom have trouble in securing the cooperation of their patients while others have repeated examples of procrastination. The following table shows the time these cases were rererred

TABLE II

	Vo of Co	1565	Per Cent
Scen by Surgeon	Reco cred	Died (Per Cent Approximate)
Before 24 hrs	114	4	40
Between 24-36 hrs	21	1	<i>7</i> 5
Between 36-48 hrs	47	3	1 <i>7</i>
Between 48-60 hrs	8	0	27
After 60 hrs	68	14	278
No mention	15	0	5

It is certainly surprising to note that more than one-quarter of all of these cases, 27 8% were referred to the surgeon after 60 hours. Although I have not checked up the cases of adult appendictis occurring in Schenectady, I am under the impression that the proportion of late cases seen by the surgeon is somewhat smaller. If this is so, is it because the diagnosis is more difficult in the young due to the frequency of gastro-intestinal upsets, or is it due to a misconceived sense of pity and reluctance to operate on a child? I, personally, believe that both factors enter into the difficulty and that the answer to the problem is early consultation in all cases where there is any doubt

I have said that the time of operation bears a direct relation not only to the mortality rate but also to the morbidity rate. This is very well illustrated in a study of cases which did and did not require drainage and the length of time of hospitalization. The sequence of pathological changes in the appendix and the peritoneum is a very constant factor. Within 24 hours from the onset of the disease, these changes seldom require drainage and often not within 36 or 48

hours—but following this time the formation of localized abscesses, granulation tissue, or the development of generalized peritonitis necessitates the use of drains. The following table, omitting the 18 cases not operated, shows the number of clean cases and the number of drained cases.

TABLE III

Appendix excised, not drained	166	60%
Appendix excised, drained	66	23.8%
Appendix not excised, drained only	45	16.2%

The effect of drainage on the morbidity as shown by the length of hospitalization is clearly illustrated when we find that the average stay of the clean cases was 10½ days, while that of the drained cases was 19½ days

The abdominal pathology described at the time of operation is of some interest. I have separated it into two groups, the first showing the pathology of the appendix itself, and the second, the peritoneal pathology One point which is definitely brought out in these tables is the neglect on the part of the surgeons to adequately describe the pathology at the time of operation. In 30 cases, there was no mention made about the pathology of the appendix and in 54 cases, no mention about the peritoneal pathology This oversight makes these cases almost worthless in a critical analysis of hospital work and I feel that if we exercise a little more care in our pathological description, our histories will be of real value for future study

TABLE IV

Gross Appendix Pathology in Cases Operated

	Recovered	Died
Acute diffuse inflammation	125	1
Gangrenous	36	1

	Recovered	Died
Negative	78	0
Free fluid	54	2
Considerable peritonitis	18	ō
General peritonitis	4	6
Localized abscess	56	5
No mention made	52	2
	262	15

End results as regards later developments, such as post-operative hernia, are not known for the whole group. However among the 295 cases comprising this study 140 were taken care of by Dr. Stanton and me. There were eight deaths

results were similar Of these 212 cases, 156 improved during the initial treatment (usually ? or 3 weeks in duration) in the Institute, while . 55 are classed as unimproved because there was no appreciable reduction of pressure during this time Some cases in this latter group, however, showed subjective benefits or a fall of pressure after a considerable period of continued treatment at home This experience warrants the conclusion that salt-free diet furnishes the best and most specific means of treating hypertension cases, and that striking benefits are accomplished in the great majority of cases when the diet is properly carried out

A STUDY OF ACUTE APPENDICITIS IN CHILDREN UNDER 12 YEARS OF AGE*

With an Analysis of 295 Cases Occurring in the Ellis Hospital, Schenectady, N Y

By C W WOODALL, MD, FA.CS

88

HIS study of acute appendicits in children was prompted by a desire to determine in as far possible the factors responsible for death in those cases which have not survived and to survey any possible relationship in the morbidity and mortality to the methods used in handling these cases on the various days of the disease As a basis for this study I have reviewed all cases of acute appendicitis in children 12 years of age and under occurring in the Ellis Hospital, Schenectady, between July 1, 1923 and October 1, 1927, a period of 4 years and 3 months Hospital records prior to this time had not been kept in such form that they were readily available for study However, I have been able to add to these hospital records many additional cases operated by Dr Stanton or me prior to July, 1923 The total number of cases available for study are All cases treated in Ellis Hospital since July,

207 Cases operated by us prior to July, 1923 295

The age frequency is of interest and is shown

* Read at the Annual Meeting of the Schenectady County Medical Society December 6 1927

in the following table The earliest case occurred As the age increases, in a child two years old so does the frequency up to age 7 or 8, and it will be noticed that 85 per cent were found in children 6 years of age and older

TABLE I—AGE INCIDENCE

6		27	12	38

I have not referred to the question of symptoms and diagnoses in this study as this paper is not a review of appendicitis in general but rather an analysis of certain cases and the factors bearing upon the results obtained

In this series of 295 cases, there were 22 These fatalities will be disdeaths or 745% cussed in detail later on Eleven cases were carried along on the Ochsner treatment and recovered without operation 262 cases were operated upon and recovered

which should have been drained. The second one of these cases, admitted on the 4th day, was operated at once. A gangrenous appendix was round which ruptured while being freed from adhesions, spilling pus contents. The surgeon mentions on his report that there was granulation tissue about the appendix, yet in the face of this fact and the spilling of pus, he did not drain. The child died the following day. Is it not possible that this death may be charged to an error of judgment on the part of the surgeon?

The next one of these cases may also represent an error in judgment. A 6-yr-old child was seen on the 5th day with a peritonitis. Presumably he had had no nourishment to speak of during this time. He was placed on strict Ochsner treatment for 8 more days, after which a large abdominal abscess was drained. Following the operation he was again placed on strict Ochsner until he died 3 days later. That gave a total of 16 days' starvation which numerous hypodermic injections of heart stimulants administered in the last 24 hours failed to combat.

The 4th case, a boy age 5, was seen on the 6th day of the disease. After 2 days of Ochsner treatment a localized abscess was drained. He was discharged from the hospital 23 days later as recovered. Twenty-five days later he was readmitted because of pain in the upper right quadrant accompanied by septic temperature. Operation performed the same day showed multiple liver abscesses and portal pyemia. He died of toxemia 2 weeks later. This case represents one of the complications that is occasionally seen in acute appendicitis, not controllable by the surgeon and usually of fatal termination.

The 5th case, a girl age 11, seen on the 6th day, was operated immediately upon admission

She had a history of a ruptured appendiceal abscess 3 hours previously. At operation the abdomen was found full of purulent fluid and a simple drainage was done. The child died a few hours later from toxemia. This death illustrates one of the real dangers attendant upon late cases. The scattering about of a lot of virulent pus in the general abdominal cavity from the sudden ripture of an abscess permits the rapid absorption of toxins which usually has a fatal termination.

The last of these 6 late cases illustrates the same danger as the previous one, a 4-year-old girl, seen on the 12th day with a sudden rupture of an appendiceal abscess. An immediate drainage was done but she expired the following day from toxemia. Both of these cases were recognized as hopeless at the time of operation by the surgeon

In looking at these 22 deaths in retrospect it seems quite possible that some of them may have been saved. In 2 cases there is a definite history that the family physician did not seek surgical aid when it first should have been sought. In 1 case a technical error at operation may have been the determining fatal factor—while in 5 cases the surgical judgment of the operator may be open to criticism Taken as a whole, the mortality rate of 71/2% compares favorably with other groups of acute appendicitis treated by other groups of surgeons That, however, is no reason for congratulating ourselves. When a study of this kind shows that there is a possibility that the mortality rate might concervably have been reduced to below 5%, it is an indication that not only we, but others with similar mortality rates, are not getting the best results in the treatment of acute appendicatis

PELVIC TUMORS COMPLICATING PREGNANCY

(Report of Two Cases with Normal Delivery Following Extirpation of the Growth in the Sixth Month)

By ARTHUR STEIN, MD., FACS, NEW YORK, N Y

TERINE or adnexal tumors complicating pregnancy may give rise to serious trouble, either during pregnancy or labor. While there are many tumors, especially those which are located high up in the abdominal cavity, which give no disturbances whatsoever, there are others which either through sudden changes in their position (twisted pedicle of ovarian cyst), or through their location way down in the pelvis (incarcerated myoma) might give rise to serious acute abdominal conditions. In these cases immediate operative interference is imperative, irrespective of the pregnancy. To the latter category the following two cases belong

Within twenty-four hours I was called to see

two patients each of whom had a pelvic tumor with acute symptoms complicating a six months' pregnancy. Both recovered from operation without mishap and later had normal full-term deliveries. In the cases here reported the presence of acute abdominal symptoms arising from complications in the growths themselves made immediate operation necessary.

REPORT OF CASES

Care 1—F R, a married woman, aged 32, was admitted to the Lenox Hill Hospital, March 21, 1927, in the sixth month of her first pregnancy, complaining of abdominal pain of eight weeks' duration. She had had rheumatism eighteen

in this group leaving 132, 5 of whom have developed post-operative ventral hernias out of a total of 46 drainage cases. This is in line with other groups of cases which gave about a 10% incidence of ventral hernias in drainage cases.

The fatalities in this study are comprised of 22 deaths, nearly 7½% of the total number. An analysis of these shows that 1 death occurred in a case seen within 12 hours of the onset of the disease, 3 occurred in patients seen within 24 hours, 1 within 36 hours, 3 within 48 hours, 7 within 72 hours, and 7 after 72 hours. The following table shows the above

TABLE VI

No of Deaths in Relation to Time of Consultation

Time of Consultation	Deaths
Within 12 hours	1
Between 12-24 hours	3
Between 24-36 hours	1
Between 36-48 hours	3
Between 48-72 hours	ž
After 72 hours	7
Total	22

Among these 22 deaths were 7 cases which were not operated but put upon the Ochsner treatment. One of these had been sick but 48 hours until the time of admission to the hospital. She expired 9 days later from general peritonitis and septicemia. I believe it possible that an operation performed in this 48-hour case might have saved her life—an operation performed either immediately, or perhaps at the end of 5 days at which time her temperature and pulse had come down to nearly normal.

Five of the non-operated cases were seen by the surgeon after 3 days had elapsed. On the chart of one of these is the tragic note that she was seen by the family physician on the second day but was not referred to the surgeon until the following day. These cases remained on Ochsner treatment from 2 to 7 days and all died of peritonitis. The last of these non-operated cases was not seen until the 4th day and was evidently in extremis for he died within 24 hours from peritonitis.

The remaining 15 cases which were operated upon are discussed in order of their time of admission to the Hospital. The child who was operated within 12 hours after the onset of the disease was evidently the victim of a surgical tragedy for the record shows that the appendix broke while being removed and that the contents were scattered over the intestines. He expired 3 days later from peritonitis and extreme toxemia, the fever rising to 1072

Of the 3 cases seen within 24 hours of the onset, one died 48 hours after operation from what was probably peritonitis although no cause of death was given Another died in 29 days. In

the latter case a secondary drainage of a localized abscess was performed 2 days before death. Both of these cases had perforated appendices with considerable peritoritis at the time of operation. The 3rd 24-hour case was operated immediately upon admission and, in spite of considerable general peritoritis, did very well until the 6th day when she started to run a septic temperature which continued until her death on the 22nd day

The 36-hour case has a note on the chart that the family physician was called the day previous but because of personal illness gave telephone in structions as to treatment and did not see the case until the following day. At the time of operation the head of the cecum was so indurated that inversion of the appendiceal stump could not be made. The child died 2 days later of peritonitis. If the referring Doctor had recognized the danger of delay in this case, the outcome might have been different.

I believe that one of the 48-hour death cases may possibly be attributed to an error in Judg-The child was only 21/2 years old, and instead of being operated immediately, was placed on Ochsner treatment for six days, after which a localized abscess was drained with death fol I do not believe that young lowing 2 days later children stand the starvation of the Ochsner treatment nearly as well as do adults and it is possible that this little boy might have been saved if he had been operated before his resistance had been lowered by this long period of starvation The second 48-hour case was apparently doomed Immediate operation showed a from the start The child belly filled with foul smelling pus died the following day from overwhelming toxemia

The two cases seen after 72 hours were both put on Ochsner treatment. One, a boy 4 yrs old, was operated 4 days after admission when a simple drainage was done. He expired 3 days later, the cause of death being given as acute intestinal obstruction with peritoritis. The other, a 12-yr-old girl, was put on Ochsner treatment for 6 days. At operation a localized abscess was found containing the remains of a gangrenous appendix. This was removed and the abscess drained. Five days later she died of peritoritis.

The group of 6 cases seen by the surgeon after 72 hours were admitted to the hospital from 4 to 12 days after the onset of the disease. The first of these, a 9-year-old girl, was seen on the 4th day with a very severe diffuse peritoritis. She improved greatly on Ochsner treatment for 24 hours, was then moved to another room, followed by a marked exacerbation of symptoms. On the next day, it was decided to relieve the abdominal tension by drainage. A diffuse peritoritis was found with pocketed pus cavities. The tension was relieved but the patient continued to run a septic temperature and died 23 days after operation. Autopsy showed a deep pelvic abscess.

removed This step was followed by removal of the left adnexa and ligation of the stump near the uterus with two chronic catgut sutures The abdomen was closed in four layers

The wound healed by primary union and the patient made an uneventful recovery Later she had a normal delivery at term

Conclusions

1 The removal of a pelvic tumor complicating pregnancy well before the onset of labor may be expected to eventuate in a normal delivery

2 If laparotomy and the extirpation of the growth are performed carefully, abortion or premature labor is usually not induced thereby

THE CANCER SITUATION IN THE STATE OF NEW YORK

By JOHN M SWAN, MD, ROCHESTER, N Y

Chairman of the New York State Committee of the American Society for the Control of Cancer

In a paper entitled The Cancer Situation in the state of New York, New York State Journal of Medicine, January 1, 1927, I outlined a program adopted by the New York State Committee of the American Society for the Control of Cancer, for an attack on the annually increasing deaths and death rate from these diseases. The chief item of this program is the offer of the Committee to provide groups of people throughout the State with information concerning the present knowledge of cancer and of the precancerous lesions, and with facts which indicate that several widely prevalent popular ideas concerning the development of malignant tumors have no scientific basis

The present seems a suitable time to analyze the statistical information available in the publications of the New York State Department of Health from the viewpoint of counties, because the 1926 statistics have become available since the publication of the former paper, and because the county seems to be the most practical geographical subdivision in which to organize and conduct educational activities. The 1926 statistics show a continuing increase in the total number of deaths and of the rate per 100,000 population in the State as a whole and in the State exclusive of New York City

Table 1						
Year	State of New	w York	State of N Exclusive York	of New		
	Total Deaths	Rate per 100 000	Total Deaths	Rate per 100 000		
1921	11,163	105 9	5 590	1167		
1922	11 706	1099	5 7 61	1197		
1923	12,257	1139	5 970	123 6		
1924	12 791	1160	6,234	1199		
1925	13 117	1174	6 345	1198		
1926	13,560	1198	6 536	121.2		

The New York State Committee is intrusted by the American Society for the Control of Cancer with the responsibility for putting its national methods and policies into active operation in fifty-four counties in the State Greater New York long Island, Staten Island and Westchester

County form the field for the operation of the New York City Committee

Table 1 gives the statistics from the State at large and for the State exclusive of New York City for the past six years

Table 2 shows the total deaths from cancer in the fifty-four counties, in which the New York State Committee operates, during 1922, 1923, 1924, 1925 and 1926. In these counties 26,393 people died of cancer during this five year period, an average of 5,278 per year, practically the figure for 1924. In 1923 there were 134 more deaths than in 1922, in 1924, 198 more than in 1923, in 1925, 214 more than in 1924, in 1926, 100 more than in 1925.

Table 2

months previously The last menstrual period occurred September 10, 1926

For several months she had suffered from vague pain'low down in the abdomen. During the last eight weeks it was sharper and located across the epigastrium. Several days before admission the pain became much worse and extended to the lower abdomen again.

She was a well developed and nourished woman disclosing the evidences of a six months' pregnancy. The abdomen was very prominent, showing two bulging masses. One was located in the right upper quadrant, the other, a little above the symphysis pubis just to the left of the median line.

The upper mass was elongated and extended about 1 inch above the umbilicus. It was soft in consistency and had all the characteristics of a six months' pregnant uterus

The lower mass was round, smooth and cystic in consistency. It extended to about three finger-breadths below the umbilicus. It was not movable

On vaginal examination the lower pole of the tumor on the left side and that of the pregnant uterus on the right were identified. Nothing further could be learned by vaginal palpation

The clinical diagnosis was left ovarian cyst complicating a six months' pregnancy

Operation —On March 23 laparotomy was performed to extirpate the growth A median incision was made midway between the umbilicus and the symphysis pubis. When the peritoneum was opened, the uterus containing a six months' pregnancy came into view. It was found to be pushed to the right side by a left-sided intraligamentously developed tumor the size of a large grapefruit.

The left broad ligament was slit open and a trocar inserted into the tumor. About 10 oz of muco-serous fluid were obtained. The growth was then shelled out of its bed without great difficulty. The pedicle, which originated to the left of the uterus, was seized with two clamps and the stumps were ligated with double chromic catgut. There was considerable oozing from the tumor bed, which was controlled by hot compresses and gauze packing soaked with epine-phrin solution.

The incision in the broad ligament was partially sutured with chromic catgut and the abdominal wound closed in four layers. A drain was allowed to protrude from the lower angle of the wound. The uterus was in no way disturbed during the operation.

On the day following operation the evening temperature rose to 1038° F, and on the next day the left parotid gland became greatly swollen. The temperature then rose to 105° F but the fever gradually subsided in the course of several days. The diagnosis was epidemic parotitis. The

patient was jaundiced for about a week. How ever, she made an uneventful recovery from operation and later had a normal full-term delivery

Specimen —The specimen removed from the broad ligament was oval in shape, somewhat irregular in outline, and covered with adhesions. It had already been opened and showed a very thick surrounding wall, within which there was an irregular mass of grayish, firm, fibroid tissue running in thick strands from wall to wall and almost entirely filling up the interior

Microscopic examination of the tumor showed a fibromyoma composed of bundles of smooth muscle fibers supported by a small amount of fibrous tissue. In the fibromuscular tissue there were areas of hyaline degeneration and a small number of vacuoles. Though still retaining its architecture, a large part of the tumor was necrotic.

Pathologic Diagnosis —Intraligamentous fibromyoma with necrosis

Vase 2—H K, a married woman, aged 20, was seen by me in consultation with Dr Herman Schwartz on March 24, 1927, within twenty-four hours of the operation described in the previous case. She was six months along in her first pregnancy. For the last three weeks she had suffered from increasing pains all over the abdomen but most marked on the left side.

The abdomen was evenly distended Palpation produced marked pain, especially in the hypogastrium Because of this sensitiveness the examination was made under narcosis. Then very little difference was found in the abdominal outline and no free fluid wave could be effected.

Vaginal examination revealed the fact that the pregnant uterus was pushed downward into the pelvis and therefore gave the impression of being under great pressure

A catheterized specimen of urine was negative. The white blood cell count was 15,000 with 86 per cent polymorphonuclear cells

The question for differential diagnosis was between a large ovarian cyst and a ruptured appendix with general peritonitis complicating a six months' pregnancy. The patient was admitted to the Lenox Hill Hospital for operation

Operation—The abdominal cavity was opened through a median longitudinal incision and the uterus containing a six months' pregnancy exposed. It was pushed to the right by a left-sided ovarian cyst, the size of a man's head. The pedicle, which was about 2 inches in diameter, was twisted about 360° and the walls of the growth as well as the pedicle itself were gangrenous. The whole tumor was exceedingly edematous.

A trocar was inserted into the cyst and about a quart and a half of sero-sanguineous fluid were

From the figures herewith presented it would seem that the most desirable places in the State for the cancer patient to apply for treatment are those in which cancer is being studied and discussed and in which constant improvement in technique is being developed in the various operative and radiological measures. Isn't this a challenge to the profession in the non-teaching countries to unite on the cancer problem?

A study of the figures ought to give a negative reply to those who ask about cancer belts

Cortland had the highest death rate (1883) The counties to the west (Cayuga and Tompkins) had 1268 and 1435 respectively. The county to the north (Onondaga) had 1088. The county to the east (Chenango) had 1259. The counties to the south (Tioga and Broome) had 981 and 1120 respectively.

Leaving Hamilton out of the question, the lowest rate was given by Niagara (\$14), the county east (Orleans) had 1222, the next eastern county (Monroe) had 1157. The county south of Monroe (Livingston) had 1183, the next county west (Genesee) had 1483, the next west (Erie) had 1162. Take the southern tier. Chau-

tauqua, 1156, Cattaraugus, 1145, Allegany, 1467, Steuben, 1521, Chemung, 1388, Tioga, 981, Broome 1120, Delaware, 1468, Sullivan, 1130 Or again the highest death rates were reported from Cortland (1883), Yates (1846), Wyoming (1807), Ontario (1578), Greene (1569), Warren (1563), Fulton (1534), Steuben (1521), Wayne (1505)

In submitting this analysis of the cancer situation based on the statistical information available, I am aware that the figures for one or two years are far from conclusive for a disease like cancer which is chronic and lasts, on an average, of from two to three years Nevertheless, a beginning must be made in the estimation of the number of cases and of the tendencies of such a disease if measures for its control are to be attended with With the exception of cardiorenal disease and its complications and the respiratory infections, cancer is the great cause of shortening of human life It is a responsibility of the medical profession to unite in the attack upon all of these diseases, but each one requires individual methods for its control The underlying principles are about the same, the details vary

ORAL CONDITIONS IN PATIENTS ADMITTED TO A STATE HOSPITAL By R. E CLOGHER, M.D., DDS, UTICA, N Y

there were 583 admissions to this hospital and of these 569 were seen in the dental clinic where a complete examination was made and the conditions charted, necessary X-ray pictures were taken, etc, and all the work done which was needed to put the mouths in a sanitary condition. In order to obtain a better idea of what the oral conditions were a tabulation was made of the conditions found on admission and of the amount of work done.

Gums— Normal Abnormal			206 363
Mouth— Good Fair Bad			174 119 276
Edentulous— Full Upper Lower			105 52 3
Extractions Alt colectomies Antrum Cases Impactions Cysts Fillings	•		1,863 54 9 73 7 167
		1 4 41	600

In reading this chart there are several factors which must be taken into consideration In marking the gums the word normal is used perhaps a little more liberally than a strict interpretation might allow. If the gums showed only a slight variation from normal or if a condition was localized to one tooth the general gum condition was marked normal of the fully edentulous cases were marked normal so that excluding these the ratio would In grading be normal 101—abnormal 363 the general mouth conditions the number of missing teeth was not taken into considera-Only the conditions of gums, fillings, crowns, bridges and remaining teeth were considered As the edentulous were all marked good the ratio is, good 69, fair 119, bad 276 The number of cavities means the number of fillings inserted As the average patient was mature the cavities in most cases were such that extraction was indicated

Excluding the edentulous cases in which infection is but rarely found the monthly admission rate is about 40 cases a month. Perhaps a better understanding of the condition can be had if we consider what would be found in these cases as shown by the averages in table one.

Table 3 shows the death rates per 100,000 population in the fifty-four counties for 1925 and 1926, together with the percentage variation in 1926 over that of 1925. Thirty counties had a 1926 rate above the 1925 rate the greatest increase being shown by Chemung (670%), the lowest by Clinton and Monroe (08% and 09% respectively). Twenty-three counties had a lower rate in 1926 than in 1925, the greatest diminution being shown by Madison (328%), the least by Schoharie (23%)

The case of Hamilton County is a special one. Hamilton has the smallest population of any county in the State (4,296) and in 1925 no deaths from cancer were reported from that county

The death rate per 100,000 from cancer in the State of New York, exclusive of New York City, in 1926 was 1212 From this point of view, thirty-three counties had a death rate in excess of the rate for the State at large the highest rate was given by Cortland (1883), the lowest by Orleans (1222) On the other hand, twenty-one counties had a rate below the rate for the state at large the lowest was given by Hamilton (698), the highest by Ulster (1194)

In the counties having the largest populations and containing the largest cities the rates are Erie (705,395) 1162, Monroe (400,217) 1157, Onondaga (272,124) 1088, Oneida (199,613) 1293, Albany (199,345) 1460, Broome (139,327) 1120, Niagara (136,384) 814, Chautau qua (130,650) 1156, Orange (119,498) 1297, and Schenectady (118,178) 1058

The rate is low in the counties in which medical schools are to be found and in which teaching hospitals are located One might suppose the death rate would be high in these counties on account of the attraction for cancer patients provided by the attention to be had from teachers of medicine and surgery, and on account of the psychological influence of being in the hands of physicians and surgeons of state-wide, nationwide and international reputation, yet the rate is low, except in Albany County, namely,-Albany, 1460, Onondaga, 1088, Monroe, 1157, Ere. 1162 In the case of Erie County there is also the additional attraction for the cancer patient offered by the State Institute for the Study of Malignant Disease In the case of Albany County there is perhaps some unusual factor to account for the high 1926 death rate because the 1925 rate was about that of the other three counties (1160)

MEDICAL LEGISLATION

The daily newspapers of March 12 carry the announcement of an agreement among the leaders of the Senate and Assembly that the Legislature will adjourn on Wednesday, March 21 Much legislation inimical to public health, including the chiropractic bill, has died in committees, but a new chiropractic bill has been introduced

The cultists are apparently following their usual tactics and are hoping to secure recognition during the confusion and hurry of the closing hours of the legislative session Especial vigilance by the legislative committees of the County Medical Societies is required during the last few days before the adjournment of the Legislature

Mouths-	
Good	14 79
Fair	25 69
Bad	59 79
Extractions	164
Alveolectomies	5
Impactions	6
Cyst or Antrum	1
Fillings	14

It is impossible to chart the amount of infection present and only those who have examined a large number of these patients can appreciate what deplorable conditions are found in the great majority of cases. Those marked fair are generally patients who have only a few teeth

By questioning many patients it was learned that over 50 per cent had dental attention for extraction in case of toothache, about 20 per cent had irregular dental attention and not more than 5 per cent had regular dental attention. Even among the latter class it was rare that the dentist had been visited within

a year previous to admission

While it cannot be proven that mental illness is caused directly by focal infection in the teeth yet there is no doubt that physical ill health has a direct bearing on mental conditions. In such conditions as psychasthenia, manic depressive, hysteria and the deleria of toxic conditions, foci of infection in the mouth will tend to aggravate the mental condition and will delay the mental adjustments necessary for recovery. In the delirium of the toxic state due to heart, kidney and thyroid disease, and in arteriosclerosis, there can be no

doubt that dental infections may and often do play the major role in the etiology of these conditions. It is almost axiomatic that per sons over 50 who are in good health have good teeth or none, and that persons under 50 who have chronic constitutional conditions have bad teeth. The man 50 years old who looks 60 in the vast majority of cases has been the victim of dental infection.

By the time the patient has reached a mental hospital dental treatment can only prevent further infection and in but few cases claim credit for alleviation of mental symptoms. The toxins produced in the mouth are as a rule very mild and it is their long continued action that produce structural changes. The hospital dental treatment does, however, bring about marked improvement in the physical health of the patients.

The campaign for the prevention of mental illness should include a thorough appreciation of the need for better dental attention by the The great majority of the general public patients admitted to this hospital have been under the care of their physicians for a con siderable time before admission, yet from the conditions found in the mouths of these patients it is very apparent that care of the mouth has played no part in the general medical treatment Many physicians have little appreciation of the serious results that follow oral infection or they would insist on a thorough dental examination in all cases early enough to prevent the general sequelae of such conditions

A PUBLIC HEALTH CAMPAIGN

Public health work implies an organized personnel At present it is practiced by organizations rather than individuals One of the objectives of the organizations is to promote the practice of public health by individuals-which means that physicians in private practice shall be ready to give advice in public health and that every person shall seek it as readily as they now seek relief from pain

The physicians of New York State are rapidly acquiring the point of view of public health and preventive medicine The great need in public health work at present is to educate the people to practice the precepts of the doctors—that is, to practice personal hygiene If every citizen was anxious to practice personal hygiene, he would support public health projects which must be maintained by the people, among which are water works, diagnostic clinics, and health education

The field of public health practice is broad and the subjects many The State Charities Aid Association, the leading lay organization engaged in public health work, has issued a pamphlet entitled "The Next Ten Years," which enumerates its activities past, present and future

The pamphlet emphasizes four major health activities in which the association has been engaged in the past.

- 1 Anti-tuberculosis work
- 2 The anti-diphtheria campaign
- 3 Promotion of medical legislation

4 Cultivating the faith of the public in the medical profession

Mr Folks, the author of the pamphlet cnumerates eleven topics in public health in which the Association might engage as follows 1, County health units, 2, heart diseases, 3, maternity and infancy, 4, venereal diseases, 5, dental, 6, mental hygiene, 7, health of school children, 8, nutrition, 9, cencer, 10, periodic examinations of adults, and 11, teaching hygiene in public schools

From among all the opportunities Mr Folks names the following five as the ones chosen by the Association for its newer activities 1, county health departments, 2, heart diseases, 3, venereal diseases, 4, maternal mortality, and 5, correcting

defects of school children

This list is of special value for two reasons 1 It is a concrete plan, and concreteness, in distinction from theory, is always valuable in the promotion of clear thinking and planning

2 Nearly all the subjects are medical topics, and are also the objectives of the Medical Society of the State of New York and of its constituent

county medical societies

The essential feature in these plans is that of bringing medical service to individuals State Charities Aid Association emphasizes the administrative methods of bringing patients to the physicians The medical societies emphasize the methods of giving medical service after patients have come to them Each service is complementary to the other

LOOKING BACKWARD

THIS JOURNAL TWENTY YEARS AGO

Life Insurance and Health -Life insurance companies are financial organizations into whose transaction the element of health enters, and they are doing much to promote health among the people. This Journal of March, 1908, discusses the subject in the following editorial

"The life insurance companies are doing much to interest men in their own lives and in the lives of their families, and anything which accomplishes that is of salutary influ-They are a powerful and practical agency for reminding people of matters of health and longevity Men with bad habits and excesses are refused insurance, and such refusals have a good educational effect. Plant in a man's heart a deep regret that he has lived unwisely and he becomes a torch-bearer to warn others away from his unwisdom. The insurance companies also desire as examiners the competent men of the community, the effect of this being that wholesome competition and examination ensue

"There still remains for these organizations to combine in a concerted action to secure better general health conditions They can as a matter of plain business policy give every aid to medicine in its philanthropic efforts The life insurance companies could wisely take the same interest and lend aid in the work of health departments as the fire insurance companies do in the work of fire departments No single financial interest should be more deeply concerned for the public health"

PUBLIC SPEAKING BY PHYSICIANS

The course in public speaking given by the Queens County Medical Society as described on page 346, has excited the question of what use is public speaking to a doctor Anyone attending a round of Medical Society meetings and hearing a hundred doctors speak, as the officers of the State Medical Society do every fall when the District Branch meetings are going on, will say that physicians have much to do with public speaking Those who attend the meetings have the opportunity to observe the speaking methods of the doctors throughout the state, and they discern certain fundamental defects, which if corrected, would immeasurably increase the interest and efficiency of the society meetings This editorial is not a discussion of medical oratory, but it deals with some common defects which are nearly always in evidence in medical meetings

It is assumed that any doctor attempting to speak has two qualifications

- 1 He has something to say, and
- 2 He has words with which to say it

What does a doctor usually lack? He is usually defective not in the content of his speech, but in the manner of its delivery. He knows perfectly well what to say, and how to say it, but when he gets on his feet, he fails in his good intentions through a lack of appreciation of some of the fundamental principles of speech.

The most common defect among doctors is that regarding the voice. A doctor attempting to address his brethren is expected to speak loud enough to be heard in the back seats, and distinctly enough to be understood. Yet these fundamental principles are violated more commonly than any other obvious rule.

The second important defect is that regarding the form of a speech. The most effective speaker jumps into his speech at once, says what he has to say, and sits down. He does not make apologies for being called upon unexpectedly, or give the explanation that he does not know anything about the subject, and has nothing to say

Most ineffective are joshing, razzing, and horse-play, in which many speakers indulge The audience is not interested in such things, even though they may laugh. The laughter is usually at the speaker, and not with him Many a speaker thinks he is making a tre-

mendous hit because the audience laughs, but in reality the laughter is in derision rather than applause. At any rate, a serious medical society meeting is no place for that sort of an address. If the speaker has no medical thought, he had better not attempt to speak at all

The third point in regard to speaking is the length of time that a speaker should occupy Five minutes is a standard length for an extemporaneous discussion of a paper, and in fact five minutes seems interminably long when the speaker does not know what he wants to say, and says it in a way that cannot be understood

It is sad to watch the effect of ignorant discussion of an excellent paper presented by a guest of a society. The effect of many speakers is often spoiled by discussions of the inconsequential points which interest only the expert. On the other hand, crisp criticisms and pointed questions add immeasurably to the value of the speech of the visitor, and the satisfaction which he feels in delivering his speech.

The fourth point regarding medical speaking is that raised by the question Shall the address be written or oral? When a doctor is put on the program for a five minute discussion of a paper, he must make preparation for his remarks, for otherwise he will use up his five minutes in telling how good the other fellow's speech is, and how poorly prepared he is to discuss it But if he comes with a definite idea of the points which he wishes to bring out, and has prepared his notes either on paper or on the pages of his mind, he will speak with effectiveness and to the point However, if a man is down for an original five minute address on a subject, it is always best that he should write his remarks in order that he may keep his five minute address down to a limit of four minutes and avoid taking fifteen minutes to make it. The speaker will produce the greatest effect when he has condensed his remarks well within the time limit of their effective delivery

The four points of voice, form, length, and medical preparation are well within the comprehension of any physician and of his ability to observe them. If a physician's defects in these respects are pointed out to him, he will readily overcome them, and those who listen to him will bless him for his effective talk

an x-ray examination of all children as a preoperative measure. In his series of 63 cases,
11 received x-ray examinations because of
thymic symptoms. In 4 of the 11 the thymus
was definitely enlarged, in 6 doubtfully enlarged, and in 1 normal. Of the remaining 52
children, 3 were found to have definitely enlarged thymuses, although no symptoms were
present. Enlargement of the gland seems
prone to occur in the overweight, pale, and
flabby type of child. The finding of an enlarged thymus with resulting postponement of
the operation may save an occasional life—
Archives of Pediatrics, January, 1928, xlv, 1

Therapeutic Relapsing Fever—An editorial writer in the Journal of Tropical Medicine January 16, 1928, xxxi, 2, discusses the work of Plaut with the microbial cause of relapsing fever, the Spirochata duttom, in the treatment of general paralysis Although Plaut obtained favorable results with malaria therapy, it occurred to him that the therapeutic action might be intensified if an organism more closely related to the Spirochæta pallida were used infectious material was taken from the tail or heart's blood of a mouse injected with S duttom, the blood being subsequently mixed with saline and injected hypodermically or intrave-The incubation period after hypodermic injection is usually from five to seven days, after intravenous injection two to three days As a rule, from three to five chills occur The fever at intervals of six to eight days does not appreciably exhaust the patient, and is absolutely innocent in its course The discase is allowed to end naturally in from six to eight weeks. The contraindications to relapsing fever therapy are severe heart complications and severe general debility, the aortitis of paralytics is not a contraindication The treatment is not suitable in cases of "galloping paralysis" The earlier treatment is begun the better are the results, though even advanced cases are favorably influenced Comparatively incipient expansive cases are more promising than the much more common forms of simple dementia. In five of seven severe cases of tabes, in which Plaut employed relapsing fever therapy, the lancinating pains disappeared or were considerably relieved, and the ataxia became less pronounced. These preliminary observations suggest that it may be worth while to employ the relapsing fever therapy in tabes on a more extensive scale

Diagnostic Value of Determination of Nitrogen Content of Bile—A J Boekelman of Utrecht refers to recent studies by Gundermann on the bile of extirpated gall bladders with special reference to the nitrogen content in relation to stone formation. He found a higher percentage on N in stone-free bladders and

imagined that stone formation may be due to low N content The author sought to check up these finds by studies of bile obtained by duodenal intubation Tabulation of his results in gall bladders of all kinds appears to show that normal ones have less nitrogen than diseased ones, while in stone bladders great variability is shown Comparison of results with those of Gundermann shows that while the latter concern principally stone formation the others have to do chiefly with the differences between the normal and diseased gall bladder Thus in every case without reference to stone tested the normal gall bladder bile showed less than 200 mgms per 100 cc while in cholecystitis the figure was far above 200 mgms per 100 To these generalizations there have thus far been no exceptions The widely dissimilar finds in stone bladders are doubtless due to the fact that while cholecystitis is present in some it is absent in other cases. In all cases tested with the duodenal tube a positive reflex must have been present to guarantee that the source of the bile is the gall bladder, but in gallstone cases or in cholecystitis this reflex is often absent, so that the author's material is not so large as it might otherwise have been As for Gundermann's theory that stone formation may be due to low N content of the bile the author is unable to confirm either the facts or the theories The technique of the method for determination of N is not mentioned -Klimsche Wochenschrift, January 8, 1928

Fabism -Under this name Professor L Preti describes an old but rare alimentary intoxication which has been reported chiefly from Sicily, Sardinia, and Southern Italy comes about both from eating the beans and from inhaling the pollen, and only during the period April-July The essential symptoms are sudden anemia and urobilinuria while other common manifestations are icterus and hemoglobinuria The variety of bean accused is the Vicia faba, known in English as the Windsor or horse bean, which is not eaten in the United States because inferior to other kinds If the beans are ripe when consumed the disease does not appear in the alimentary form, but they are often eaten raw or but slightly cooked which seems to bear some causal relation to the toxicosis, although the author believes that the beans which are poisonous are the subject of some unknown disease is absolutely no connection between fabism and lathyrism, another food intoxication which affects the spinal cord and which is due to eating the chick pea Despite the rarity of the disease the author has notes of over 1200 cases of which less than two-thirds were due to consumption of the legumes, the remainder being due to inhalation of the pollen The anemia

MEDICAL PROGRESS

Ą

An Anaylsis of Anorexia in Children -In this study Walter M Bartlett took anorexia to mean a subjective complaint of constant loss of appetite persisting long enough to cause objective signs of malnutrition Of 1,471 children coming to an out-patient clinic 349, or 24 per cent, were found to have loss of appetite Of these 349 chilas a presenting symptom dren 35 per cent had no discoverable lesion to account for their condition, and were therefore classified as subjects of functional anorexia The five commonest reasons for bringing children to the out-patient clinic were loss of appetite, cough or cold, physical examination for admission to public school, pallor, and under-The commonest conditions found associated with marked loss of appetite were septic tonsils and adenoids, acute infectious diseases, tuberculosis, pyelitis, and dental caries, and of these septic tonsils and adenoids were Patients with functional the most frequent anorexia were treated by three methods daily administration of saccharated iron, daily administration of codliver oil, and (3) the introduction of liver, beeksteak, and kidney into the diet at least three times a week some cases anemia was associated with malnu-From the statistical data it was impossible to compare the first two groups, but both of these admitted of comparison with the The mean total gain in weight third group of the children receiving saccharated iron was 350±0402 pounds, for the children receiving codliver oil the mean total gain in weight was 475±0634 pounds, while for the children on the liver diet it was 790±0276 pounds most efficient and reliable method of treating functional anorexia in children is the introduction of fresh calf's liver, boiled beefsteak, and lamb kidney into the diet Calf's liver may be a specific stimulant to the appetite -American Journal of Diseases of Children, January, 1928, xxxv, 1

The Etiology and Treatment of Acute Poliomyelitis—S A Kinnier Wilson, after a survey of the present knowledge with reference to the transmission of poliomyelitis, emphasizes the fact that both abortive cases and healthy carners must be a menace (Lancet, January 7, 1928, ccxiv, 5445) It is his impression that direct infection is at its maximum during the incubating and the preparalytic stages. Attention must be directed to the problems offered by the patient developing the disease, by the abortive case, and by the healthy contact. In patients showing prodromal symp-

toms and in all contact, frequent disinfection of the nose and throat with douches or gargles of potassium permanganate (1 in 5,000), perovide of hydrogen (1 per cent), liquor sodæ chlorinatæ (05 per cent) or some other chlorine-containing preparation, is advisable The sole specific treatment consists in the intra spinous injection of immune serum, but this method is obviously beset with difficulties. The administration of large doses of urotropin has, in the author's hands, yielded no impressive results Recently Bordier has warmly ad vocated the use of a combination of spinal As soon as radiotherapy and diathermy spinal topical diagnosis has been made, X-ray irradiation is applied, for children under two years the dosage is 3 units H in a series of three successive seances, measurement being made at the skin level under a filter of 6 mm Above the age of three the of aluminum dose may be increased, reaching in the adult 5 units H in a series of three applications The rays should penetrate at right angles to the vertebral laminæ A period of 25 days should The diathermy, elapse between treatments which is intended to favor the nutrition of the tissues, should be utilized from the outset in dependently of the radiotherapy, and should be carried out daily for about ten minutes The sinusoidal current is also a useful adjuvant After the acute stage rational physiotherapy should be persevered with for twelve months, when its place should be taken by orthopedic measures, if such are called for

Watch the Thymus -John Howell West urges the importance of suspecting thymus en largement in infants and young children suffering from breath-holding spells with cya nosis, simple cyanosis (especially noticeable about the lips and finger nails), noisy dyspneic breathing during both inspiration and expiration, or convulsions similar to those of tetany The diagnosis is determined by means of the x-rays, and the treatment is by exposure to If no improvement follows the same rays this treatment, the thymic origin of the trouble may well be disputed As sudden death following trivial causes, such as slight injury mild infection, anesthesia, and injection of serum has occurred very frequently, the autopsy showing no cause of death other than an enlarged thymus, it is very desirable to determine the presence of such a thymus before submitting an infant or young child to even a minor operation. During the past year it has been the author's routine practice to have an r-ray examination of all children as a preoperative measure. In his series of 63 cases,
Il received r-ray examinations because of
thymic symptoms. In 4 of the 11 the thymus
was definitely enlarged, in 6 doubtfully enlarged, and in 1 normal. Of the remaining 52
children, 3 were found to have definitely enlarged thymuses, although no symptoms were
present. Enlargement of the gland seems
prone to occur in the overweight, pale, and
flabby type of child. The finding of an enlarged thymus with resulting postponement of
the operation may save an occasional life—
Archives of Pediatrics, January, 1928, xlv, 1

Therapeutic Relapsing Fever -An editorial writer in the Journal of Tropical Medicine January 16, 1928, xxxx, 2, discusses the work of Plaut with the microbial cause of relapsing fever, the Spirochæta duttom, in the treatment of general paralysis Although Plaut obtained favorable results with malaria therapy, it occurred to him that the therapeutic action might be intensified if an organism more closely related to the Spirochæta pallida were used infectious material was taken from the tail or heart's blood of a mouse injected with S dutton, the blood being subsequently mixed with saline and injected hypodermically or intrave-The incubation period after hypodermic injection is usually from five to seven days, after intravenous injection two to three days As a rule, from three to five chills occur The fever at intervals of six to eight days does not appreciably exhaust the patient, and is absolutely innocent in its course. The disease is allowed to end naturally in from six to eight weeks The contraindications to relapsing fever therapy are severe heart complications and severe general debility, the aortitis of paralytics is not a contraindication The treatment is not suitable in cases of "galloping paralysis" The earlier treatment is begun the better are the results, though even advanced cases are favorably influenced Comparatively incipient expansive cases are more promising than the much more common forms of simple dementia. In five of seven severe cases of tabes, in which Plaut employed relapsing fever therapy, the lancinating pains disappeared or were considerably relieved, and the atavia became less pronounced. These preliminary observations suggest that it may be worth while to employ the relapsing fever therapy in tabes on a more extensive scale

Diagnostic Value of Determination of Nitrogen Content of Bile—A J Boekelman of Utrecht refers to recent studies by Gundermann on the bile of extirpated gall bladders with special reference to the nitrogen content in relation to stone formation. He found a higher percentage on N in stone-free bladders and

imagined that stone formation may be due to The author sought to check low N content up these finds by studies of bile obtained by duodenal intubation Tabulation of his results in gall bladders of all kinds appears to show that normal ones have less nitrogen than diseased ones, while in stone bladders great variability is shown. Comparison of results with those of Gundermann shows that while the latter concern principally stone formation the others have to do chiefly with the differences between the normal and diseased gall bladder without reference to stone Thus in every case tested the normal gall bladder bile showed less than 200 mgms per 100 cc while in cholecystitis the figure was far above 200 mgms per 100 To these generalizations there have thus far been no exceptions The widely dissimilar finds in stone bladders are doubtless due to the fact that while cholecystitis is present in some it is absent in other cases. In all cases tested with the duodenal tube a positive reflex must have been present to guarantee that the source of the bile is the gall bladder, but in gallstone cases or in cholecystitis this reflex is often absent, so that the author's material is not so large as it might otherwise have been As for Gundermann's theory that stone formation may be due to low N content of the bile the author is unable to confirm either the facts or the theories The technique of the method for determination of N is not mentioned -Klimsche Wochenschrift, January 8, 1928

Fabism —Under this name Professor L Preti describes an old but rare alimentary intoxication which has been reported chiefly from Sicily, Sardinia, and Southern Italy comes about both from eating the beans and from inhaling the pollen, and only during the period April-July The essential symptoms are sudden anemia and urobilinuria while other common manifestations are icterus and hemo-The variety of bean accused is globinuria the Vicia faba, known in English as the Windsor or horse bean, which is not eaten in the United States because inferior to other kinds If the beans are ripe when consumed the disease does not appear in the alimentary form, but they are often eaten raw or but slightly cooked which seems to bear some causal relation to the toxicosis, although the author believes that the beans which are poisonous are the subject of some unknown disease. There is absolutely no connection between fabism and lathyrism, another food intoxication which affects the spinal cord and which is due to eating the chick pea Despite the rarity of the disease the author has notes of over 1200 cases of which less than two-thirds were due to consumption of the legumes, the remainder being due to inhalation of the pollen. The anemia

has been severe enough in a few cases to destroy life, but nearly all the patients recover The author can find records of but three au-The exact mortality is known topsy cases only for Sardinia where it is 8 per cent disease is of unusual scientific interest although its practical significance is of course limited to a small geographical zone in which it seems to have been known even to Herodotus and Pythagoras, although medically our knowledge of it dates back only to 1855 believed that the first consumption of the beans is harmless but when eaten in the following year an anaphylactic reaction develops which is the disease One outbreak confers no immunity -Klinische Wochenschrift, December 17. 1927

The Significance of Pain in the Lower Extremities and Its Treatment-Wilfred Harris warns against the dismissal of a complaint of pain as "rheumatic," or even as functional or hysterical In appraising the significance of pain in the lower extremities it should be borne in mind that pain may be due to herpes zoster in which the characteristic rash is delayed, to tabes, to osteoarthritis, sciatica or sciatic perineuritis, to external crural neuritis, disease of the spinal cord, Dercum's disease, phlebitis, or to chronic vascular disease in the form of Raynaud's disease, endarteritis obliterans, or chronic thromboangeitis For the pains of tabes and neuritis analgesic drugs, such as acetylsalicylic acid, amidopyrine, or even morphine may be used to secure temporary relief In severe tabes Harris gives two injections of arsphenamine (06 gm) at a fortnight's interval, and immediately after the sec ond injection 5 ounces of blood are withdrawn from the vein by a larger needle, from which 50 cc of serum are prepared and injected intraspinally twenty-four hours later tica, stretching the nerve by passive flexion of the hip with the knee kept straight, under a general anesthetic, followed by Swedish exercises, is sometimes of service. Better results may be obtained by one or two injections of sterile physiological saline solution into the nerve at the notch, and perhaps at the level of the tuber ischii, after first injecting 2 per cent novocaine solution freely In acute pain, relief may be quickly, though temporarily, obtained by large subcutaneous injections of oxygen in three or four places along the course of Ionization with the constant current, using large electrodes quickly padded, and a strong current up to 40 or, 50 milliamperes or even more, sometimes gives great re-The actual chemical solution used on the electrodes is not important. In Dercum's disease the administration of thyroid extract sometimes is of benefit In phlebitis rest is

essential, on account of the danger of dislocating a clot Belladonna liminents and poppy fomentations, with citric acid internally will ease the pain and arrest the tendency to spreading of the venous thrombosis Chronic thromboangeitis, in suitable cases, in the absence of glycosuria, and in subjects under the age of fifty-five, may be successfully treated by Leriche's periarterial sympathectomy—

Practitioner, January, 1928, cxx, 1

Diagnosis and Treatment of Coronary Sclerosis -P Morawitz and M Hochrein write systematically on this subject as such, and without any titular reference to myocardial dis ease, angina pectoris, or other associated af-We know of two clinical syndromes fection which point to disease of the coronaries, towit, angina pectoris and cardiac asthma, but as a matter of fact neither of these occurs in the majority of cases In 137 autopsies on par tients with disease of the myocardium and coronaries no less than 91 showed marked involvement of the vessels, while the other 46 could be regarded as myocardial degeneration without coronary disease In these 91 cases the authors frankly admit that they made the correct diagnosis in but 16, other and incorrect diagnoses being myocardial degeneration in 27, cardiac muscular insufficiency in 5, general arteriosclerosis in 9 Failure to make a diagnosis in 34 cases was due to the desperate condition of the patients on admission, they being moribund and for the most part coma-Finally in 8 cases the cardiac lesion was overshadowed by some severe general disease. Turning to the 46 cases shown at autopsy to have been simple myocardial degeneration without coronary implication, the authors made a wrong diagnosis of coronary sclerosis in 3, while in another there was disease of the aorta only, without implication of the coro With these facts speaking for themselves it does not appear that any analysis or comment can change the situation Coronary sclerosis in other words is mostly overlooked, and there remains only to add something under The authors treatment of suspected cases show that fear of digitalis is quite unfounded and it should be given, intermittently at least, in small doses, when intermitted the digitalis may be replaced by diuretin or some analogous Strophanthin on the other hand is given only intravenously, in the worst cases, and at the outset Glucose solution should be Control of abdominal meteorism is difficult but should be attempted -Münchener medizinische Wochenschrift, January 6, 1928

Actinomycosis of the Liver Following Suppurative Appendicitis—A W Greenwell, writing in the Military Surgeon, February, 1928, lxii, 2, describes two fatal cases of actinomy-

cosis of the liver following suppurative appendicitis, one coming under his own observation, the other having been contributed by Leland S McKittrick Both patients failed to convalesce normally after appendectomy During a prolonged illness, tuberculosis and subphrenic abscess were considered, but the real nature of the disease was not diagnosed until the fungus was actually demonstrated at a secondary operation. One pathologist states that "actinomycosis sometimes affects the appendix, but is found unexpectedly and has no characteristic feature." In patients developing liver complications following a suppurative appendix and not showing external sites of infection, or positive actinomycotic sputum from a pulmonary involvement, the diagnosis is difficult and is made too late to admit of a cure. It would. therefore, seem that a thorough pathological examination of each appendix, removed in the presence of pus, would be necessary if the presence of this fatal fungus is to be detected. It has been stated that the extension of actinomycosis is via the connective tissue and that the formation of fistulous passages is characteristic, but in both cases here reported the liver lessons were apparently metastatic. The eradication of the fungus before it reaches the liver depends on its early detection and the removal of the tissue in which it appears Medical measures have apparently little curative power for this aspect of the disease

The Question of a Recrudescence of Diphtheria in Europe—The infrequency of diphtheria in the European capitals since the war is shown not only by figures but also by the indifference of the profession to the Schick controlled toxin-antitoxin active immunization as carried out in the United Nevertheless of late disquieting reports have come from large hospitals in Berlin and Paris of a new septic type of the disease which is said to resist antitoxin experience is said by hospital practitioners to have been most disheartening Fortunately thus far the disease has not assumed epidemic proportions Opinions differ as to the questions of increased virulence, mixed infection, etc., and the findings have not been uniform in this respect. According to one view what is known as septic or malignant diphtheria is not so much a matter of increased virulence or mixed infections as of the milieu, for the victims have mostly been the poor, who are badly fed, living in badly ventilated and lighted quarters, etc. This view is borne out by the quarters, etc fact that few cases of diphtheria gravis have been reported from private practice Dr O Stiner, the author of the paper quoted, adds figures from the Swiss cantons There has been no great epidemic since 1893-4

marked and steady decrease in mortality has been ascribed to the use of serum serum, diphtheria headed the mortality list of acute diseases but for a long time it has been at the foot. In the last few years not more than 3 deaths for every 100,000 inhabitants have occurred Certainly there has as yet been no evidence of any recrudescence of the disease in a malignant form or otherwise in any of the Swiss cities At the same time, the author holds, they should be prepared to meet the first evidences by vigilant measures such as active immunization, isolation, the use of The mere fact that the polyvalent sera, etc new expression of the disease is limited largely to the poorest quarters of the largest cities is not without some significance—Schweizerische medizinische Wochenschrift, January 7, 1928

A German Questionnaire on the Value of Protective Diphtheria Immunization. -Schwalbe says that active immunization against diphtheria by the toxin-antitoxin mixture has never come into extensive use in Germany although for some years it has been very largely resorted to in the United States and elsewhere In order to ascertain the reasons for the indifference of German pediatrists to wholesale immunization the author addressed a questionnaire to the leaders of this group and obtained answers which were fairly First of all diphtheria has been rare in Germany since the war. Another reason may be the uncertain duration of the period of immunity, which in the experience of some The majority of pediatrists excuse themselves from replying owing to lack of personal experience Several are firmly opposed to anything which savors of compulsion and in fact to any wholesale campaign There were no unfavorable comments based on possible dangers nor did any one go on record against local immunizing campaigns when the Some contended that disease was prevalent since the majority of the population is immune to the disease naturally it was somewhat far fetched to attempt to improve on Nature Attention was called to the fact that in the United States where active immunization has been carried out on a large scale the disease is still flourishing, but the fact that the method has been effective in the groups actually immunized seems to have been ignored Professor Degkwitz who spent months in the United States in the study of the method and later introduced it into Munich is optimistic, but would make immunization compulsory only in institutions. In contrast to the situation in the United States the Schick criterion seems to play a minor role, as not much reference is made to it - Deutsche medizmische Wochenschrift, January 13, 1928

LEGAL

By LLOYD PAUL STRYKER, Esq Counsel, Medical Society of the State of New York

CONSTITUTIONAL LAW

This is the second in our promised series of The subject embraces the most interesting, the most fundamental and the most important branch of jurisprudence Constitutional law involves a consideration of the powers and the limitations of government itself as in this country, the Federal and the various State Constitutions are written, the subject here embraces an understanding of those written Constitutions, the purposes for which they were written, their history, and their application to the various departments of government, as well as to the question of whether or not a given statute is in violation of the Federal or of a State Constitution, that is, whether a given statutory enactment is or is not a "constitutional law"

The word "constitution" has been many times defined Corpus Juris calls it "that fundamental law of a state which contains the principles on which government is founded, regulates the division of sovereign powers, and directs to what persons each of these powers is to be intrusted and the manner of its exercise"

Judge Story, in his celebrated treatise on this subject, wrote "A constitution is in fact a fundamental law or basis of government, and falls strictly within the definition of law as given by Mr Justice Blackstone. It is a rule of action prescribed by the supreme power in a state, regulating the rights and duties of the whole community."

Mr Justice Miller, writing for the Supreme Court of the United States, declared "A constitution in the American sense of the word is the written instrument by which the fundamental powers of government are established, limited, and defined, and by which those powers are distributed among the several departments for their safe and useful exercise for the benefit of the body politic"

The story of the adoption of the United States Constitution forms one of the most brilliant and fascinating pages of our history. The Revolutionary colonists, during the period of their war with Great Britain, faced the problem not only of meeting and overcoming the armies of King George, but of providing an arrangement under which these previously unrelated communities could work together, institute and enforce the powers of taxation, carry on negotiations with foreign countries, and provide the means for the support of Washington's armies. The colonists were living under a loose arrangement known as

the Articles of Confederation These Articles were defective in many ways, but primarily, they were wanting in that no means was there provided of enforcing its obligations upon individuals or of compelling States to meet their just share of the financial burdens of the Revolution More than six years elapsed after the successful issue of the struggle in the field before the defects and ills found in and arising from the Articles of Confederation were remedied

Finally, in 1787, there was called at Philadel phia a convention of delegates representing twelve of the thirteen original States vention was presided over by George Washing-The delegates comprised the leading characters of the new-born country Among these were Rufus King of Maine, Roger Sherman of Connecticut, Alexander Hamilton of New York, William Livingston of New Jersey, Gouverneur and Robert Morris, Jared Ingersoll and Benjamin Franklin of Pennsylvania, John Dickinson of Delaware, Daniel Carroll of Maryland, James Madison and George Washington of Virginia, John Rutledge and Charles Pinckney of South Finally, after a summer of debate to Carolina which the public was not admitted, a Constitution was evolved, which provided that upon its ratification by the conventions of nine States, it should be established as the Constitution of the United States of America

For a long time, it seemed as though an insufficient number of the States would be willing to accept it New York was one of the most Through the brilliant work of Alexdoubtful ander Hamilton at Poughkeepsie, finally the New York convention fell in line, and in 1789, the Constitution of the United States was adopted Its preamble recites not only its purpose, but reveals the nature of the defects of the previous arrangements which it was designed to cure The preamble reads "We, The People of the United States in Order to form a more perfect Union establish Justice, insure domestic Tranquillity. provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America"

The United States Constitution has been justly praised by jurists and philosophers not only in America, but throughout the world Gladstone declared that it was the greatest document ever primed by man.

The delegates at the Philadelphia convention were all acquainted with and were deeply influenced by the teachings of history and by the writings of philosophic jurists abroad. It is evident that they had read and pondered Montesque's 'Spirit of Laws''. The problems encountered in the democracies of Greece and Rome and of the early republics were understood, and the reefs on which they had all Leen wrecked were charted and avoided.

The Constitution consists of six Articles entire document can be printed on seven pages It enumerates the powers of government, and separates those powers into three great divisions The executive, the legislative and the judicial It defines the powers and the duties of each, and marks out the limitations of those powers and The American Bill of Rights is comprised in the first ten Amendments which were proposed by the first Congress and ratified by the legislatures of the several States in the year 1791 The Eleventh Amendment was adopted seven vears later the Twelfth in 1803, the Thirteenth in 1865 the Fourteenth in 1868, the Fifteenth in 1869, and then for forty-four years no new Amendments were adopted In 1913 the Sixteenth and Seventeenth Amendments were added to the Constitution The Eighteenth and the Nineteenth followed six years later

The method by which Amendments to the Fedcral Constitution may be adopted is clearly set forth in Article V, which declares that whenever two-thirds of both Houses of Congress shall deem it necessary, they may propose Amendments to the Constitution, or, on the application of the legislatures of two-thirds of the several States shall call a convention for proposing Amendments, which Amendments in either case shall become valid when ratified by the legislatures of three-fourths of the several States or by conventions in three-fourths thereof The former of the two methods is the one which has been up to this time employed No constitutional convention has ever been called since the original convention of 1787

There is but one limitation to this power of amendment, and that is expressed in these words "No State without its Consent shall be deprived of its equal Suffrage in the Senate" With that single exception, it is possible to amend our Federal Constitution at any time and in any way, provided the method pointed out by the instrument itself is followed

Anyone can read the United States Constitution in less than half an hour, but to understand it is the work of a lifetime, because it is not only to the Constitution that you must turn, but to the decisions of the Supreme Court of the United States, which for 139 years has been construing

The Constitution, then, marks out the boundaries of the government and defines what may

or may not be done by the courts, the executive or the legislature, but the Constitution is the creature of the people, it was adopted by them, and they have the power to change or alter it "It is not," said Judge Cooley, "the fountain of law nor the incipient state of government, it is not the cause, but consequence, of personal and political freedom it grants no rights to the people, but is the creature of their power, the instrument of their convenience" But unless revolution is resorted to the only way in which the Constitution can be changed is in the manner previously referred to—the manner laid down by the Constitution itself

'This Constitution" declares the Sixth Article, "and the Laws of the United States which shall be made in Pursuance thereof, and all Treaties made or which shall be made, under the Authority of the United States, shall be the supreme Law of the Land, and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary not-withstanding" No statute of any State, nor any of their Constitutions, therefore, are valid if they conflict with the Constitution of the United Further to emphasize and enforce this concept, the same Article continues "The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers both of the United States and of the several States, shall be bound by Oath or Affirmation to support this Constitution, but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States"

One of the intricate problems involved in the adoption of the Federal Constitution arose from the jealousies and ambitions of the several States. This problem was met by the Ninth and Tenth Amendments which read

"ARTICLE IX The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people

"ARTICLE X The powers not delegated to the United States by the Constitution, nor prohibited by it to the States are reserved to the States, respectively, or to the people"

Thus every right and power possessed by individuals or by the States prior to the adoption of the Constitution and which were not delegated to the United States by the Constitution, were preserved intact. The power of local self-government except as limited by the Constitution of the United States, remains as it was prior to the time that instrument was adopted.

There is in each State, we find a State Constitution, setting forth and defining the rights, the powers and the duties of the respective branches of the State government. Each State, under the terms of its own Constitution, may adopt such amendments to its fundamental law as it chooses, provided that such amendments do not conflict with the Federal Constitution. Each State has

340 LEGAL

its own legislature, and adopts its own laws, it may adopt any laws it chooses, provided these laws do not conflict either with the Constitution of the State or of the United States

Thus, in our country, the constitutional problems presented to the Courts may, and usually do, involve two questions. Does the particular law conflict with the State Constitution? Does that law conflict with the Constitution of the United States? The decisions of the highest Courts of the several States, and of the Supreme Court of the United States embrace and make up that vast body of jurisprudence known as "constitutional law"

In this country, then, Congress and the legislatures of the various States are not supreme, but may enact only such laws as are not in conflict with the State and Federal Constitutions England, there is no written constitution, although the word "constitution" is there constantly in use What is meant by the English constitution, has nowhere been more clearly stated than by Wood-row Wilson who wrote "The Constitution of England consists of law and precedent She has great documents like Magna Charta at the foundation of her institutions, but Magna Charta was only a royal ordinance She has great laws like the Bill of Rights at the centre of her political system, but the Bill of Rights was only an Act of Parliament She has no written constitution, and Parliament may, in theory, change the whole structure and principle of her institutions by mere But in fact Parliament dare not go faster than public opinion, and public opinion in England is steadily and powerfully conservative That is a very impressive tribute which Sir Erskine May feels able soberly to pay to the conservatism of a people living under such a form of government when he says 'Not a measure has been forced upon Parliament which the calm

judgment of a later time has not since approved, not an agitation has failed which posterity has not condemned"."

But in the United States, public opinion also plays its part in constitutional law Whereas our constitutions are in writing, the meaning, the im port and the interpretation of those written words are constantly under scrutiny by the Courts From time to time, opinions as to what the words of the Constitutions mean, broaden and change and no doubt, will continue to shift with the passing A careful study of the constitutional de cisions and of the contemporaneous history which is their setting and their background, reveals how frequently the Supreme Court has been affected by the great body of public opinion existing at the time of the making of the decisions A his tory of the Supreme Court and of its constitutional decisions, is a history of the United States The controversies which were fought out in that great tribunal, have not always rested there. When in 1860 and 1861, eleven of the Southern States decided to withdraw from the Union, they were acting upon what they thought was a power retained by those States at the time when they en-They followed at tered into the Federal Union least the form of constitutional usage, they adopted ordinances rescinding the original ordi nances by which they had adopted the Constitu There is nothing in the Constitution which granted them the power which they essayed On the other hand, there was no express provision in that document prohibiting that power The ultimate decision was fought out not in the Supreme Court or in Congress, but at Antietam, Chancel lorsville, Gettysburg and in the bloody Wilderness before Richmond In the future, will appeals from constitutional decisions ever again be taken to that final arbiter the bloody field of battle? Who can tell?

CAESARIAN SECTION—INFECTION—DEATH

About the first of June, a physician was called to attend a patient who at the time believed she was in labor. After examination by the physician, it was found that the patient was not in labor. The physician then advised her to come to his office for regular prenatal examination. The patient at that time was about eight months pregnant, and had not previously consulted any physician with reference to her pregnant conditions.

About the 20th of June, the defendant physician was again called to the patient's home, at which time he found her in the first stages of labor. After examining her vaginally and externally, he found that her pelvic measurements, which had not been taken up to that time, were

a good deal below normal Her labor pains were irregular in time and quality, and the physician suggested waiting until the labor pains became more normal to see whether under these conditions the patient would make any progress to wards delivery

After about twenty-four hours in labor, no progress was made, and the family becoming apprehensive, asked for a consultation, which was acquiesced in by the attending physician Another physician was called in consultation. An examination was made of the patient to determine the diagonal conjugate, which was done by a vaginal examination. The patient was then ordered to the hospital, and the rest of the pelvic measurements were taken with the pelvimeter.

At the time she entered the hospital, the uterus was dilated about two and one-half fingers. The consultant substantiated the findings of the attending physician, and advised an immediate Caesarian section, as the condition of the fetus by examination of the fetal heart was apparently good.

Prior to the performance of the operation, the usual and customary routine of scrubbing with green soap and otherwise cleansing and preparing the parts, was done The Caesarian section was performed by the consultant, assisted by the attending physician, and a third physician took care of the child after its delivery. In the performance of the operation, a median line incision was made beginning at the symphysis pubis from below, extending upward for about six or seven inches up to the umbilicus. The uterus was then delivered from the abdomen, and the entire abdominal cavity packed off with sterile pads dipped in saline The uterus was then opened, the broad ligaments being firmly pressed by the assistant's fingers to control hemorrhage, and the surgeon removed the child by breech extraction uterus was then closed by three continuous lines of sutures and one line of interrupted sutures The body of the uterus was then cleansed with saline solution, and the uterus replaced in the abdominal cavity After the removal of the fetus, the placenta was removed by the surgeon abdominal cavity was closed in layers, the deep sutures being chromic and the superficial sutures absorbent There was no indication for drainage, no pus being present at the time of operation

After the operation, the patient was returned to bed A post-operative shock enema consisting of six ounces of saline was administered. The patient was also given two ounces of whiskey

The Caesarian section was performed at four o'clock in the afternoon The patient was again seen by the physician at about 7 30 in the evening, and also at 10.30 She was seen on the morning following the operation three or four times by both physicians. On these visits, after examination her pulse was found to be very rapid, and she was still suffering a certain amount of shock, the temperature ranging from 103 to 104 The patient was given an injection of saline solution in an effort to overcome the shock and to As she had quite a give her some body fluid quantity of gas in her stomach, medication of fluids in any large quantity by mouth were dis-Under the stimulation that was adcontinued ministered to the patient, she made a marked improvement, and on the evening following the operation, her temperature had gone down to about

However later that evening, the patient had a

chill, and her temperature rose to 104, her abdomen becoming considerably distended at the same time. This condition was combated by further support and administration of stimulatives for the heart, and an irrigation of the lower bowel by the insertion of a rectal tube for the expulsion of the gas. After the hist chill, the patient had several other chills, her temperature remaining high. The patient did not rally from any treatment that was administered to her

Three days after the operation, the operating surgeon removed the dressing, inspected the wound and found a little serum oozing from the incision. He loosened one or two of the silk worm sutures to promote drainage of any pus that might collect in the superficial wound. There was no pus present at the time, just a serous discharge.

On the evening of the third day after the operation, the physicians advised the husband that the patient was in a serious condition. At two o'clock in the morning of the fourth day after the operation, the patient died

The husband had in the meantime called another physician to see the patient. The second physician who was called in removed the dressings, examined the patient, and later advised the attending physician that he had found that the patient had been infected, and that he further opened the abdominal wound, and a certain amount of sero sanguineous pus came from the wound, and that he removed another interrupted suture to facilitate drainage. This physician approved of the after-treatment that was being rendered to the patient, and ordered in addition ten drops of adrenalin to be administered hypodermically every two hours.

The cause of death was given as to aemia from general peritonitis following Caesarian section. No autopsy was performed upon the patient, although one was requested by the attending physician, but the husband refused to consent to the performance of an autopsy.

Neither prior to the operation, nor at the time of the performance of the operation, was there any indication of the presence of infection from any cause Prior to the operation, the patient's condition was good, temperature being normal, her heart action normal, and she was having good labor pains. The patient was, however decidedly overweight, small in statute and sluggish mentally

An action by the husband as administrator was instituted against the attending physician and the surgeon. However, after the same was pending for some period of time, the plaintiff consented to a discontinuance of the action.

NEWS NOTES

LEGISLATION

Bulletin number 8, which was issued by the Committee on Legislation of the Medical Society of the State of New York, on February 29, contains the following items which are of general interest to the physicians of New York State

HEARINGS

No hearings are announced for next week or later, as a matter of fact, if the Assembly resolution for adjournment on March 16th is supported by the Senate, the Assembly committees will be discharged on March 6th and the bills remaining with them will go to the Committee on Rules On February 28th a great many bills had hearings, some of them with but a twenty-four hour previous announcement. The following we were interested in

Assembly Int No 481—Story—amending the Health Law making it a felony to violate the habit forming drug portion. Although this bill was amended the day previously so as to except physicians, pharmacists, druggists and dentists, it, nevertheless, drew very powerful opposition.

Assembly Int No 1113—Doyle—requiring the labeling of cosmetics, was opposed by drug manufacturers because the bill provides that the date of manufacture shall be printed on the label

Assembly Int No 1296—Cooney—Health Law, X-ray machines, copy of which is enclosed, drew considerable opposition. The dentists opposed it because they are not included among those permitted to operate machines. It was pointed out that the bill carries no provision for enforcing the law and the Department of Health objected to the enforcement being placed with them

Assembly Int No 1028—Olsen—birth control bill The usual proponents and opponents appeared The hearing developed conclusively hat the proponents were not interested from a medical point of view, but wished the law amended for its social welfare effect. This argument did not impress the Codes Committee very forcibly.

BILLS ENCLOSED

Assembly Int. No 1349—Gleason—to amend the Workmen's Compensation Law in relation to permanent partial disability. It may be said that there is hardly a likelihood of any labor bills being acted upon this year until after the commission makes its report. It is rumored now that the report will be submitted by next Monday evening

Assembly Int No 1456-Lidzy-the anti This is the same bill that vaccination bill we have had annually and the same opposi tion should be presented, but may we suggest that you ask some of your lay friends to write Doctor Lattin their opposition to this bill In past years we have occasionally been some what embarrassed by having such meager sup port from the lasty The opposition to the bill last year was limited to three professional men, and the Bernarr Macfadden group called the committee's attention to the fact that it opposition were in the interest of the public, the public was but poorly represented and therefore, it could be said with truthfulness, was but slightly interested

Supplement March 7, 1928

A new chiropractic bill was introduced in the Assembly on Tuesday by Mr Congdon, of Allegany County It is important that as much pressure as possible be brought to bear immediately upon the Rules Committee, before whom the bill goes The personnel of the committee is Joseph A McGinnies, Eberly Hutchinson, Edmund B Jenks, Nelson Cheney, Russell G Dunmore, Fred L Porter Herbert B Shonk, Abraham Grenthal, Maurice Bloch, Peter J Hamill, and Irwin Steingut

Every chairman should immediately write to each member of the Rules Committee, and the chairman whose Assemblyman is a member of the Rules Committee should write a special letter to him. Do this immediately, because the bill may come up any day for decision. It is of the usual vicious character, it is almost a duplicate of the bills that were introduced last year, providing for a special examining board and including a waiver clause.

Garrett W Timmers,
Harry Aranow,
Committee on Legislation,
Medical Society of the State of New York

COMMITTEE ON ARRANGEMENTS FOR ANNUAL MEETING

A twenty-page bulletin covering every phase of the preparations for the annual meeting of the Medical Society of the State of New York in Albany on May 21-25, has been issued by the Committee of Arrangements through its chairman, Dr J N Vander Veer of Albany The committee consists of James N Vander Veer, M D, Chairman, Augustus H Hambrook, M D, Peter L Harvie, M D, Charles W Woodall, M D, Wilham P Howard, M D, Clarence E Mullens, M D, Joseph A Cox, M D, Daniel B Lynch, M D, and Sherwood V Whitbeck, M D

The following subcommittees have been appointed to carry on the details of the work as set forth in the bulletin

Reception and Registration, Dr C W Woodall

Hotels and Garages—Dr J N Vander Veer Meeting Places—Drs W P Howard and S V Whitbeck

Ball and Banquet—(Tuesday evening, May 22nd) Drs D B Lynch, P L Harvie, C W Woodall

Commercial Exhibits—Dr A J Hambrook, Entertainment and Publicity—Dr C F

Finance, Audit and Account—Dr J N Vander Veer

Heart Demonstration-Dr J A Cox

The meeting places have been arranged as follows

The House of Delegates will assemble in the Hotel Ten Eyck, in the Grand Ball Room on the top floor, at 2 o clock on Monday, May twenty-first Supper will be served to the delegates on the ground floor of the hotel at the close of the afternoon session A charge of \$2 50 will be made to each delegate

The formal annual meeting of the Society will be held in the Grand Ball Room of the Ten Eyck Hotel in connection with the annual banquet on the evening of Tuesday, May twenty-second A charge of \$500 will be made for

the dinner

All other features of the annual meeting will be conducted in the State Armory on Washington street, just west of the Capitol building There the registration table for members will be located, and all the scientific sessions will be held. The center of the main floor will be assigned to the commercial exhibitors, while the sections will meet in the Company rooms. There will be abundant space for everybody, and every feature will be easily available.

The commercial exhibits will be of great importance to physicians. The exhibitors are advertisers in our Journal, and in the course of a year the money which they pay into the treasury of the Medical Society of the State of New York amounts to nearly half as much as the amount which the physicians themselves pay. The advertisers have treated the members of the State Society with cordiality and the Society in turn is providing the exhibitors with space in the very center of the activities of the meeting.

A special number of this JOURNAL will be devoted to the annual meeting, in which all its features will be fully described

ANTI-DIPHTHERIA POSTER CONTEST

The poster contest on the subject of the prevention of diphtheria is being stimulated and conducted by the State Department of Education through Mrs Z B Kimmey, supervisor of drawing

The expense of the contest is borne by the Out-Door Bill Posting Company which will see that the successful poster is reproduced and distributed over this and other states at its own expense. The contest is open to members of the art classes of high schools or normal schools of New York outside of New York City, and will extend from February 15th to May 15th. Prizes will be offered, the first one being a scholarship in the College of Fine Arts in Syracuse University, worth \$365.

Prizes for the poster will be awarded in accordance with their availability for reproduc-

tion on the bill boards Color, action, grouping and legends will all be considered in the determination of merit. It is expected that the picture will tell a story in itself and that the reading matter will bear directly upon the prevention of diphtheria.

Each poster must be a horizontal rectangle, approximately 16x36 inches, with a uniform white margin of 2 inches. Three colors and black should be used

This contest has been suggested by the Anti-Diphtheria Conference, in which are represented the State Department of Health, the State Department of Education, the Metropolitan Life Insurance Company, the State Committee on Tuberculosis and Public Health of the State Charities Aid Association, and the State Medical Society

TUBERCULOSIS MONTH

The National Tuberculosis Association will conduct a country-wide educational effort to promote the early diagnosis of tuberculosis

This campaign will extend throughout the month of March and will be conducted through the tuberculosis associations of the states and counties. Also the county medical societies will be urged to consider the problem and their members will doubtless receive literature and communications.

Physicians are likely to ignore these appeals because they are made so frequently that they

become commonplace, yet to know tubercu losis is to know practically all other diseases of the chest. If an examiner can recognize the milder signs of incipient tuberculosis he can also recognize the more evident ones which indicate pneumonia. Practicing the examination of the chest of a suspected tuberculosis patient is the best training for the examination to determine any disease of the lungs.

It is to be hoped that the physicians of New York State will respond to the appeals of the National Tuberculosis Association

THE DUTCHESS-PUTNAM MEDICAL SOCIETY

A regular meeting of the Dutchess-Putnam Medical Society was held at the Nelson House, Poughkeepsie, N Y, Wednesday evening, February 8, 1928, at 8 30 o'clock The meeting was called to order by the President, Dr H St John Williams at 8 50 P M

Dr Charles M Gilmore of Beacon, N Y, was

elected to membership

Dr Krieger moved that Dr L. E Rockwell of Amenia be made a life member of the County and State Medical Societies Carried

Dr Borst moved that 200 copies of the By-Laws with up-to-date revisions be printed Carried

Dr Borst moved that the President arrange an open meeting for March Carried

Dr John A Card, Chairman of the Public Health and Public Relations Committee, submitted the following report

Maternity Mortality Rate

	1925	1926
N Y State	56 <i>7</i>	55 3
N Y City	51 4	452
Dutchess County	61	<i>7</i> 06

Baby Climcs

4 Poughkeepsie-weekly

1 Vassar Hospital 3 Board of Health

1 Rhinebeck-monthly

1 Beacon-monthly

No regular ones in rest of county—one was held in each of 13 towns last summer

Pre-Natal Clinics

2 Poughkeepsie—weekly Vassar Hospital Board of Health 1 Beacon—monthly In rest of county—none

Tuberculosis Work

The committee feels the need of more and better tuberculosis work, perhaps more climes, especially out in county, and that we are not getting cases early enough. In 1926 there were reported 122 new cases from Dutchess County. As there were 51 deaths in the county outside of institutions in 1925, it makes an average of 24 new cases to every death. Authorities say we should find at least 5 or 6 or even more.

More coordination is needed between the different agencies doing public health nursing work. There are 22 nurses doing public health work in the city and county working for 14 dif-

ferent agencies

Dr Sadlier moved that the report be endorsed and that the Committee be authorized to carry

on the work as outlined Carned

Dr John A Card was appointed chairman of a committee with power to arrange a testimonial dinner to Dr John H Cotter in commemoration of his fifty years medical practise

Scientific Program

Dr James T Harrington, Poughkeepsie, N Y, "Phlebitis"

Dr H W Stibbs, Poughkeepsie, N Y, "Physiology of Respiration with Demonstration of Apparatus"

Members present Drs Williams, Howard, Malcove, Cavanaugh, Patterson, J H Dingman, Borst, Sobel, Boyce, Harrington, G MacKenzie, Deyo, Peckham, Rivenburgh, Malven, Malone, Vigeant, LeRoy, Conger, J I Cotter, J H Cotter, C E Lane, McCabe, Herridon, Slee, Burns, Sadlier, Davison, Gosse, Cheney, Thomson, Toomey, Krieger, Cadwell, Simon, Neighbors, Voorhees, Davison, Stibbs, Card and Carpenter,—41 Meeting was adjourned at 10 30 P M for refreshments

H P CARPENTER, M D, Secy Treas

PROSECUTION FOR ILLEGAL PRACTICE IN ORANGE COUNTY

Quick action on the part of the health officer of Middletown, Dr H J Shelley, who is also Secretary of the Medical Society of the County of Orange, and of Mr H B Royce, Counsel for the Middletown Physician's club and the Medical Society of the County of Orange, resulted in the arrest and conviction of a selfstyled "Miracle Man" who called himself Professor Caballah, but whose real name was Harry Schoenhaut, for illegal practice of medicine The prisoner had hired rooms in Mitchell Inn, Middletown, and was treating cases of nervous disease. One woman patient who was paralyzed was brought to the healer in the arms of a friend The healer came to Middletown a few days before February 22, and when on that day his activities became known, the health officer immediately got in touch with the Albany office of the Medical Society of the State of New York, and with the Department of Education, and as a result an investigator was sent to Middletown at once Two detectives were detailed to the case and gave the Professor \$500, although the clinics were advertised as free. A charge was immediately made before City Judge Starr, who at once imposed a fine of \$25 and a jail sentence of three months on Schoenhaut, but he remitted the jail sentence on condition that the Professor should immediately leave town, which he did after pawning a gold watch in order to pay his hotel bill

The Middletown Times-Herald for February 25th and 27th printed a full account of the case and in addition it ran an editorial which says

"We are incorrigible believers in magic, no matter how civilized we are supposed to be Let a fakir appear and call himself a swami, or Mazdaz, or a psycho-therapist, or anything else suggestive of the esoteric, and abused bodies and damaged souls are freely placed at his disposal Pseudo-Freudians, half-baked psychoanalysts have wrought incalculable damage during the last few years Cultists The Mr Caballah was one everywhere thrive of this type-a type a great deal more dangerous potentially than the ordinary patent medicine fakir or peddler of the secrets of Solomon and Sheba He was here only two or three days. In that time he was able to attract patients, but that the police got to him before much damage was done was indicated by the circumstance that he had to pledge his watch for funds sufficient to pay railway fare after he had paid a \$25 fine. The police often manage to save us from ourselves'

BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Castle Hall, on February 15, 1928, was called to order at 9 P M, the President, Dr Gitlow, in the Chair

The following were elected to membership Bernat Abraham, Marcus Kaftal, Joseph H Lapin, Nat Spitzer and David Zahn

Dr Cunniffe, for the Committee on Legislation, reported in detail upon the status of the Bills affecting the medical profession that have been introduced in the State Legislature. Dr Aranow presented the Report of the State Legislative Committee with particular reference to the Assembly Bill (Int No 426) permitting an injured employee to select his own surgeon was debated considerably, but no definite action was taken because it was thought that the Bill which the Committee on Medical Economics, of which Dr Britt is Chairman, is interested in having introduced, will cover this matter asmuch as the conference assumed a neutral attitude, it was agreed that the County Societies might use their own judgment in advising their Assemblymen with regard to its opposition or support

General discussion followed after which it was moved and carried that a Committee of five be appointed to go to Albany for the purpose of furthering the amending of the Workmen's Compensation Law to permit a free choice of physicians by employees, provided there is such a Bill in the Legislature

Dr Magid, for the Committee on Medical Economics, reported on a general survey of the conditions in our community that tend to affect the economic status of the physicians This Report was referred to the Comitia Minora

A communication was received from the Medical Society of the County of Schenectady enclosing Resolutions passed by that Society opposing the proposed amendment to the Public Health Law pertaining to the possession, administration and prescribing of narcotics (Assembly Int 480) changing the penalty for violation of this law, from a misdemeanor to a felony. The Resolutions also asked that Article 22 of the Public Health Law be repealed. It was moved and carried that the Bronx County Medical Society go

on record as endorsing the Resolutions of the Schenectady County Medical Society

The Scientific Program then proceeded as follows

PAPERS

- 1 "Acute Subdeltoid Bursitis," Jacob Grossman
- 2 "Oral Syphilis and Differential Diagnosis," illustrated by lantern slides, Adolph Rostenberg
 - 3 "Diagnosis and Treatment of Early Syphi-

lis," illustrated by lantern slides, A Benson Cannon

The above Papers were discussed by Drs J Gardner Hopkins, Zigler, Lobell and Wincor Drs Rostenberg and Cannon closed the discussion

It was moved and carried that a vote of thanks be extended to the readers of the Papers

I I LANDSMAN, MD, Secretary

ART EXHIBIT BY PHYSICIANS

The second annual New York Physicians' Art Exhibit will open at the Academy of Medicine, Fifth Avenue and 103rd Street, New York City, on April 1, 1928 Any physician is eligible to contribute original work in paining, sculpture, drawing, etching, etc Contributions must be sent to the New York Physicians' Art Exhibit Committee, care of Superintendent, New York Academy of Medicine, 103rd Street and Fifth Avenue, New York City, not later than March 21, 1928 Each piece should be labeled (on the back) with title and name and address of the contributor Duplicates of these labels are then to be sent by mail to the Committee at the above address before March 21st

The New York Physicians' Art Club, under whose auspices this exhibit is given, particularly invites out of town physicians to participate in this exhibition

All correspondence should be addressed to Dr Henry A Bancel, 1 West 68th Street, New York City

A similar exhibit was held in the Academy during the first fifteen days of last March, as described on page 320 of the March 15, 1927, issue of this Journal The exhibit consisted of 575 articles by 78 exhibitors. It is expected that this year's exhibit will be even larger and more comprehensive

REGISTRATION OF PHYSICIANS

At the present time 16,500 of the practicing physicians of the State are registered with the Department of Education for the year 1928. In order that the names of the 1,000 remaining practitioners, who have not yet registered, may appear in the 1928 annual directory published by this Department, it will be necessary for them to

register not later than Maich 20th, on which date the final copy of the list goes to press

The statute provides a penalty for late registration after January 1st, and this penalty must be paid by all physicians who register later than March 1st.

HAROLD RYPINS, M D, Secretary, New York State Board of Medical Examiners

COURSE IN PUBLIC SPEAKING

A course in Public Speaking for doctors has been announced by the Queens County Medical Society, through its Committee on Economics, of which Dr L M Rohr of Jamaica, is Chairman, and with the cooperation of the Queens Borough Tuberculosis and Health Association

The instruction will be given on every Wednesday evening in Jamaica, beginning on February 29th, and continuing for twelve lessons. An expert instructor has been engaged and a fee of \$50 will be charged for each student, but one-half of the fee will be paid by

the Health Association for the first thirty-five matriculants on the ground that the ability of physicians to address audiences is an asset in Public Health

Courses in Public Speaking are being conducted for the general public by YMCA and other organizations, and physicians are availing themselves of the opportunity to acquire the ability to address audiences. The Queens County experiment will be watched with interest by physicians throughout the United States. See Editorial on page 332

MEDICAL WARES

CLINICAL THERMOMETERS

The thermometer was invented by Galileo four and a half centuries ago, and was very soon used by Sanctorius in diagnosing fever. The self-registering feature of a thermometer was invented in 1781, but its present form was not developed until one hundred years later.

The small clinical thermometer was first made about 1865 and came into general use about 1873. The present reliability and accuracy of the clinical thermometer are the result of a century of research and experiment.

A clinical thermometer is essentially a handmade product whose accuracy depends upon the skill of the workmen, and on frequent cests and a rejection of inaccurate products. Each thermometer is made individually and very few machine processes are used

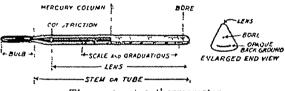

The basis of a thermometer is the tube which forms its graduated stem. The bore of this tube has a diameter about one onethousandth of an inch, which is smaller than that of the human hair The tube is triangular in section and its rounded front edge acts as a microscope to magnify the film of the mercury so that it may be read with ease. The tubes are drawn from a hollow cylinder of glass on one side of which a layer of white glass is fused so as to form a background against which the column of mercury may be read. The cylinder is made triangular shaped in a mold and is then drawn into a tube about two hundred feet in length which retains the triangular shape of the cylinder and in which the original bore is reduced to an extremely small size Most thermometer tubing in the United States is made by the Corning Glass Works, and is shipped to the thermometer manufacturer in six-foot lengths

The first process in the manufacture of a thermometer is that of measuring the bore of each tube with a microscope. The tubes having the same sized bore are placed together, but the bore may not always be exactly the same throughout the length of the six-foot tube, and so the thermometers made from one tube may vary slightly, and frequent tests are therefore necessary during the process of manufacture.

The next step in the manufacture of a thermometer is that of fusing the bulb to the stem Each bulb is made individually from normal glass tubing and its size is adjusted to that of the bore of the stem. A trial bulb is first formed and fused to one of a bunch of tubes of a uniform bore. The crude thermometer is then filled

with mercury and tested at 95 degrees and 110 degrees, to see if its scale will occupy the proper proportion of the stem. A bulb too large will require too long a scale for the length of the stem, while one too small will produce too short a scale to read. If the trial bulb is satisfactory, it is used as the model by which to judge the size of the others. Judging the proper size of a bulb requires great experience on the part of the workman.

The rapidity with which a thermometer registers depends largely upon the size of the bore. A large bore requires a large bulb and a small bore takes a small bulb. The little mercury required for the small bulb becomes heated in a minute or less time, and hence the names, one minute, or two minute thermometers.

The parts of a thermometer

The self-registering feature of the thermometer consists of a constriction which almost closes the bore and yet allows the mercurv to pass when it is under pressure small section of the stem is heated with a pointed flame and a tiny cavity is blown in This section is reheated and the heated tube its cavity is constricted by melting down the internal walls so as to close the central part of the cavity and yet leave a small opening on each side through which the mercury will pass when under the pressure of the heat of the bulb or the concussion of shaking down the thermometer Those thermometers whose constrictions are so large as to allow the mercury to fall are called retreaters, and are rejected The manufacturer also eliminates those whose bores are so small that excessive force is required to shake the mercury down

Rough handling may cause a thermometer to become a hard shaker or a retreater by fracturing some part of the constriction of the chamber. A hard shaker as well as a retreater may develop from shaking down the mercury by the concussion of hitting the fist holding the thermometer against the other fist. The proper way to shake down the mercury is to swing the arm in a circle while holding the thermometer with the bulb downward.

Thermometers are sometimes exploded by

their exposure to the sunlight, or a radiator, or by rinsing in hot water. A clinical thermometer will not stand a temperature much higher than that marked on the stem

The calibration of a thermometer extends from a low point of ninety-four degrees to a high point of one hundred and ten degrees, and is done in a way that is accurately con-A bunch of thermometers is placed in a water bath at a temperature of exactly 94°F, and the upper ends of the mercury colunin are marked on the stems The thermometers are then placed in a bath at 110°F, and each one is marked for that temperature Each thermometer is then placed in a machine which lays off the graduations uniformly, one-fifth of a degree apart Two pointers of the machine are set at the end marks, and the machine then automatically lays off the calibrations, each one being one-eightieth of the distance between 94 degrees and 110 degrees Since the thermometer has a registration range of sixteen degrees, and the calibrations are marked in fifths of a degree, there will be eighty marks in the length of the thermometer

The calibration of a thermometer is individual to that particular instrument, and is different from that of all other thermometers The bore of a thermometer may not be exactly uniform throughout its whole length, and so the 986° mark may be slightly wrong unless it is checked. Accurate tests of the completed thermometer are made, and those whose calibrations are more than one-fifth of a degree in error, are discarded Still the uniformity of the size of the bore is surprising, and comparatively few thermometers are rejected on account of imperfections in the original tube About one-quarter of all high class thermometers are correct to within one-tenth of a degree It is no reflection on a thermometer or the manufacturer that a correction of not exceeding one-fifth of a degree must be made In fact a recorded correction is evidence that the thermometer has been inspected and its possible error measured

Glass changes with age and sometimes undergoes a slight warping, thereby diminishing or expanding the size of the bore. The high class thermometer is kept for six months or more in order that it may undergo the maximum amount of change. Each thermometer is marked with its own individual number and a certificate of its accuracy is enclosed when it is sold.

Almost the only machine work on a thermometer is that of etching its markings. The thermometer is coated with wax, on which its graduations, its individual number, and the manufacturer's name, are scratched by machines which work on the well known principle of the pantograph that is used for copying drawings and maps. The thermometers are then placed in a bath containing hydrofluoric acid, which eats into the scratched spaces on the glass. The wax is then removed, and colored enamel is rubbed into the marks.

The manufacture of high grade thermometers also involves other points which are necessary in order to insure accuracy and reliability. The mercury is distilled three times to insure a high degree of purity. Yet minute pieces of glass may enter the mercury or particles of air may be imprisoned in it, and their presence may not become evident until a stringent inspection is finally made.

The reliability and accuracy of the thermometer are secured by careful hand work, which costs money A thermometer might be manufactured cheaply, but a machine-made thermometer would lack the accuracy which a modern physician demands. One guaranteed to register accurately within a tenth of a degree is the product of costly skill

It is interesting to note the psychological reaction of the workmen to visitors. When a skilled workman is watched, he is likely to become self-conscious, and his mind to be diverted from its task. Accuracy in his work requires his undivided attention, and since the skilled operators work mostly by the piece, visitors are not encouraged in a thermometer factory.

Thermometers are made with considerable van ation of the details, but all undergo the same processes of manufacture The bulb may be made spherical for rectal use, or the graduations may be shortened so that they end at 96°F Centigrade graduations may be etched on them instead of the Farenheit scale, and they may be mounted in a variety of cases Yet the essential parts of every thermometer are made by the handwork of highly skilled operatives as has been A standard clinical thermometer 15 described an instrument of precision, whose readings show far less variation than the temperatures of two normal persons who appear to be similar in other respects

2

THE DAILY PRESS

THE BEAUTY TREATMENT OF THE INSANE

A modern hospital for mental diseases provides the means by which the inmates may lead a normal life, one of the elements of which is a good appearance in company. The New York Times of January 18, makes editorial comment on a report that the State Hospitals of Illinois have installed beauty parlors as a part of their therapeutic equipment. The editorial says

"Insane though the clients may be, the parlors are well patronized. Few of the inmates are so far out of their minds as not to want to look their best. Some of them have become so interested in the business of beautifying that they have qualified as skillful assistants. Already the new department has proved itself worth while as an aid in the recovery of patients displaying an interest in it.

"It is perhaps too soon to expect elaborate statistics and reasons for this improvement Psychologists themselves have not always been quite clear on such subjects as whether we laugh because we are happy, or are happy because we laugh. If the latter is true, then the same logic would account for the fact that a woman fresh from the hands of a beauty specialist is nearer sanity than when she looks a dowdy frump. A properly prettified woman, hair bobbed and waved, skin glowing, nails immaculate, lips with a touch of rouge, certainly looks a sound, normal creature. And no doubt that helps her to feel so."

Such articles as this are of great value in educating the people regarding the true nature of life in a state hospital. They are quite willing that their kin should go to a hospital in which free beauty treatment is an example of the normal attention which the patients receive. An additional element in the hospital treatments is that the patient is free from the nagging and the razzing of the mother and aunt at home. If a woman wants to have her hair curled or her nails polished, she can do so without the annoyance of spying relatives

SILENCE

Can there be a sound without a human ear to perceive it? Can the normal human ear escape hearing sound of any kind? Is there such a thing as absolute silence for any normal person? Writers, even the editorial writer of this Journal, are seriously disturbed by sounds, and they seek quiet nooks in which they may think in quietude But sound is an inward quality and like an accusing consequence, it intrudes into the most secluded places, and annoys those who most wish to escape 1t The seeker after silence finds it best amid the turmoil of a crowded city, for the annoyance comes not from the vibrations that strike the ear, but from those which trickle down the auditory nerve and piece the brain like a needlepoint. The most annoying of all sounds is the nibble of a mouse in a silent midnight The New York Times of February 17 comments editorially on the search for silence and tells the experience of a Parisian writer

"A nervous man, easily disturbed by noise, he arranged with an architect to build a sound-

proof room in his home. When he began work in his silent chamber he found that in spite of the padded walls, two feet thick and stuffed with sawdust, every noise from outside came to his ears, magnified rather than diminished. He abandoned the refuge, went to a hotel, and in the inner depths of a seven-room suite wrote his play in comparative quiet.

"It must be that a sensitive writer who seeks complete quiet for concentration on his work concentrates rather on any tiny sound which escapes the mufflings of the padded chamber. By such a one a fly's footfall could be distinctly heard and he might even be distracted by the beating of his own pulse."

Two sounds are especially annoying to our editorial ear as we read our exchanges on the train. We can usually escape the giggling flapper by taking refuge in the smoking car and the rumble of the train drowns the whistle of the male of the species. The more noise the train makes, the less is the annoyance of other noises.

AMBULANCE CHASING

The evils of ambulance chasing are being recognized by the courts of New York State. and leading lawyers are attempting to purge their ranks of the chasers, just as physicians are trying to control the few doctors who give their assistance to the shyster lawyers Nearly every issue of the New York newspapers of the higher class carries plans regarding the purifying activities of the bar associations and courts The action of Presiding Justice Dowling of the Appellate Division of the Supreme Court in ordering an investigation of ambulance chasing is described editorially by the New York Times of February 9, as follows

"The investigation will be conducted by a Justice of the Supreme Court, in special term, with full power to compel attendance of witnesses and the production of books and papers

"The inquiry is to cover the whole business practices of counsel for defendant or plaintiff and all their agents and activities of whatever kind, all unlawful agreements to split fees. pay money for any purpose in connection with claims, in short, all unprofessional, obstructive or corrupt practices of the ambulance-chasers and their squads of runners, henchmen and go-betweens

"The proceeding, new here, was successfully There an inquitried in Milwaukee last year sition initiated by the Lawyers' Club was entrusted by the Circuit Court to three of its members sitting en banc. A pretty state of things was disclosed One ambulance-chaser, not a lawyer, had boasted that he had six hun-After the investigation, dred cases pending the Court purged its records of all cases tainted with malpractice of any kind or made the plaintiffs do the purging by canceling corrupt contracts and hiring new counsel The ambulance retinue is said to have practically gone out of business in Milwaukee Since these personal injury cases are the main crowders of the calendar, there is additional, ample reason for the judicial inquiry"

The New York Herald-Tribune of February 9 says editorially

"This action by the Appellate Division may be regarded as a legal landmark in this state It is a highly important assertion of the court's The judiciary law gives the Sujurisdiction preme Court power and control over attorneys But Justice Dowling maintains that even without a statute the proposed investigation can be ordered "as the exercise of a power inherent in and an essential attribute of courts of justice of general jurisdiction" He cites the decision of the Supreme Court of Wisconsin fully sustaining the Circuit Court in the ambulance-chasing investigation which succeeded famously in Milwaukee

"The disciplinary power of the Appellate Division of the Supreme Court, Justice Dowl ing observes, 'is not merely passive, it does not have to rest mert until some third party calls it into action' Most beneficial doctrine, laymen will say The aggressive mood of the Appellate Division and of the bar associations promises a real cleanup, the more so, perhaps, since it has taken them a long time to get up their fighting blood"

The New York Sun of February 20, in its column called "The Sun Dial," gives the fol lowing vivid picture of the ambulance chaser

"You're badly hurt, aren't you?" asks the ambulance chaser reaching the side of a man who has been merely dazed by a falling flower

"No," replies the victim truthfully "Don't be silly," argues the lawyer "You'll never be physically perfect again"
"Who are you?" asks the man

"I'm your attorney" "I have no attorney"

"Of course you have Here's my card Now, sit still until the ambulance comes"

"I don't want an ambulance," argues the

"Shut up, and don't speak any more except when counsel so instructs I've sent for the ambulance"

"But I'm a busy man, and I've got an ap-

pointment, and" "Are you too busy to take a chance on get ting \$50,000?"

"No"

"Then close your eyes and ride in the ambulance as your lawyer orders!"

"It sounds like good business The lawyer sues. If he collects anything the client gets 10 per cent or less If he fails to collect any thing the client owes him for legal services When it is all over the client is usually in worse shape than he was before the accident.

"There are lawyers who can give any am bulance a start and beat it to the hospital The ideal training for this type of barrister is one year at a law school and three years on a running track

"The big mistake is made when the colleges gives him a diploma It should give him a pair of roller skates and make clear to him that he should work with Blackstone, not with blackjack "

When the funny columns of the newspapers take up a problem, one may be sure that the people generally are becoming interested in its solution

BOOK REVIEWS

EMERGENCIES OF AI GENERAL PRACTICE. By the late NATHAN CLARK MORSE, A.B., M.D. Revised and rewritten by Amos Watson Colcord, M.D. 2nd Edition Octavo of 541 pages, illustrated. St. Louis, The C. V. Mosby Company, 1927 Cloth, \$10.00

Among the various books written on emergencies of a general practice the above volume certainly goes into careful detail of the majority of conditions with which any man in that field may be confronted. The book is systematic, brief and clear of detail The surgical problems are carefully worked out with sufficient data to establish an accurate diagnosis in most cases. All the various specialties, as eye, ear and throat, gynecology, etc., have been given their respective consideration. The outlines on treatment are thoroughly modern. In the medical emergencies there might have been included the management of some of the serious acute infectious diseases. However, excluding the latter, this is one of the best volumes for emergency reference that has been written.

Affections of the Stomach By Burrill B Crohn, M.D Octavo of 902 pages, with 361 illustrations Philadelphia and London, W B Saunders Company, 1927 Cloth, \$1000

The author has drawn from a large amount of clinical matter and observation which have been recorded in an interesting fashion.

Although the book in general follows the accepted form of devoting the early chapters to the anatomy, physiology, etc., the clinical relationship is constantly kept in the foreground. The association between the laboratory, surgeon and clinician is manifest throughout the book. The chapter on Gastric Neurosis deserves special mention because of its discussion from a purely psycho-neurotic standpoint. The surgical treatment of Gastric and Duodenal Ulcers is discussed by Dr. A. A. Berg, whose experience in this field is vast.

This volume should prove of value not only to the specialist but also to the general practitioner

IRVING GRAY

Diseases of the Skin A Manual for Students and Practitioners By Robert W MacKenna, MA, MD 2nd Edition, revised Octavo of 452 pages, with 143 illustrations Baltimore, Md., The Williams & Wilkins Company, 1927 Cloth, \$7 50

In this the second edition, Dr MacKenna has very wisely continued his original plan of classifying the commoner diseases of the skin according to their etiology or location, a plan which makes for a quicker understanding of dermatology by the student and a decided advantage to the general practitioner in the diagnosis and treatment of the diseases which present themselves in his daily work. The illustration of this book is particularly well done, there are many beautifully executed color plates and the monochromes are from photographs made "close up" thereby defining the lesions in a most satisfactory manner. The paragraphs on treatment deal generally and in detail with each disease and the author's favorite prescriptions are printed in such manner as to make them readily accessible. Four years of association with Dr McKenna's first edition has quickened our desire for this greatly augmented and revised new volume. The book is well printed and its publishers are to be congratulated on their excellent production.

N. T. B. and G. F.

A Text-Book of Physiology For Medical Students and Physicians By William H Howell, Ph.D., M D 10th Edition, revised Octavo of 1081 pages, with 308 illustrations Philadelphia and London, W B Saunders Company, 1927 Cloth, \$6.50

The medical literature of the United States now contains a book on physiology that is second to none. Howell's Physiology now long familiar to medical students appears in its tenth edition, which is superior in every particular to the previous editions. It is easier to read, and so splendidly arranged that it cannot but help to form a very useful part of the physician's guides in the search for knowledge of the normal. The author has given the various views on the many subjects on which there is still debate, so that the reader will not believe a certain viewpoint is yet the truth. Such a method of treating subjects has the greatest value, as there are so many who wax dogmatic about things today, when no one really knows the truth about the subject. Regardless of the field of the human body in which the practitioner may be interested, he will find the subject well presented from the physiologic standpoint in this text.

J Arthur Buchanan

THE ESSESTIALS OF OTOLOGY By GEORGE BIRMINGHAM McAuliffe, A.B., MD Octavo of 177 pages, illustrated New York, Oxford University Press, 1927 Cloth, \$400 (Oxford Medical Publications)

This small volume represents the author's method of teaching otology to the undergraduate students at Cornell University. He has succeeded in including a practical exposition of the diseases of the ear, such as suffices for the medical student, and has eliminated much that is advanced and theoretical

The information is presented in so-called "tabloid" form, the margin of each page containing topic words or topic sentences which sum up the subject treated in that particular paragraph.

The various functional tests for the cochlear and vestibular nerves are clearly and concisely stated

The surgical technique of acute mastoiditis is given so as to acquaint the student with the most frequent otologic complication.

There is a chapter on the various drugs used in the commoner ear diseases

The majority of the illustrations are free hand drawings by the author

Students of medicine will find this volume an excellent guide in their undergraduate studies

BENJAMIN H ABRAHAMS

GETTING WELL AND STAYING WELL. A Book for Tuberculous Patients, Public Health Nurses and Doctors By John Potts, M.D. Octavo of 223 pages St. Louis, The C. V. Mosby Company, 1927 Cloth, \$2.00

This book will be found useful by tuberculous patients and public health nurses, also by doctors not widely experienced or specially trained in the diagnosis of incipient tuberculosis and who happen, for one reason or another, to find themselves in need of a guide to the proper teaching of fundamental principles. The book is practical and trustworthy. Nothing is advocated that is not orthodox. A commendatory introduction by Dr. J. B. McKnight, Superintendent and Medical Director of the Texas State Tuberculosis Sanatorium, gives further assurance as to the book's dependability. A. C. J.

OUR NEIGHBORS

ROCKY MOUNTAIN SPOTTED FEVER

A serious disease called Rocky Mountain spotted fever is endemic in the Northwest Colorado Medicine for February contains an article on the disease by Dr Carl S Gydesen of Colorado Springs, from which the following abstracts are taken

"Rocky Mountain spotted fever is an acute, endemic, non-contagious, febrile disease transmitted to man by the bite of the wood tick, dermacentor Anderson Stiles, which has been infected by an organism called Dermacentroxe-

nus Rickettsi

"Rocky Mountain spotted fever is intimately associated with the settlement and agricultural development of any region that harbors in-The most constant locality in fected ticks which the fever prevails in Montana is in the Bitter Root Valley in an area four to ten miles wide and fifty miles long In Idaho it has been reported along the entire north bank watershed of the Snake River"

"Man plays no part in the perpetuation of the virus, and in this way the disease differs from malaria, yellow fever and typhus virus is propagated in nature, first, by the infected ticks feeding on smaller wild animals (squirrels and rabbits) and infecting their hosts, while these infected animals, transmit the virus to other feeding ticks, second, through the hereditary transmission of the virus from an infected female to her eggs and then through the different life stages of the

"The life cycle of the Dermacentor Andersom is about two years. During the winter months the ticks lie dormant under logs and stones, but upon the appearance of the first warm days in the spring they crawl upon the grass, weeds and bushes from which they can easily attach themselves to the passing larger They lay from one hundred to several thousand eggs and then shrivel and die The larvæ hatch from the eggs in thirty or forty days if the weather is warm The larvæ stick in clumps to the ground foliage and await the passing smaller animals to which they at-They become engorged in tach themselves about five or six days and then drop to the ground where they lie dormant for three or four weeks before molting. The skin is then cast and the asexual nymphs are born form again attaches itself to a host, becomes engorged and falls to the ground where it lies dormant for three or four weeks while the metamorphosis into the adult form takes place"

"Two types of Rocky Mountain spotted

fever are recognized depending upon the sever ity of the disease and the mortality rate. The Bitter Root strain is exceedingly virulent and it is rare for an adult to recover Statistics indicate a 90 per cent mortality The Idaho strain is decidedly less virulent and the mortality seldom exceeds 5 per cent Botanical and climatic conditions probably explain this great difference in mortality. In the Bitter Root Valley of southwestern Montana the win ters are severely cold and long The summers are mild and the tick infested areas are gener ally shaded and moist Here the larvae and nymphs feed on the Columbian ground squir rel and the adult ticks attach themselves to the domestic animals Along the Snake River in Idaho the summers are very hot and dry On these dry sage brush plains the jack rab bit is the principal host for the infected ticks Later investigations have shown that ticks which have been well fed will produce the disease much more readily in guinea pigs than the unfed ticks will"

"The disease usually infects persons whose occupation takes them into the sage brush and mountainous regions, such as stockmen, miners, shepherds, prospectors, lumbermen, hunt

ers and summer tourists"

"The incubation period varies from five to ten days with an average of seven days Dur ing this time the patient complains of malaise, chilly sensations and has a slight evening tem-Then an abrupt chill occurs and it is followed by a temperature of 103-104"

"On the third, fourth and fifth days the characteristic eruption appears It develops first on the ankles, wrists and forehead and then spreads to the rest of the body The lesions are scattered at first, but they become more numerous on each succeeding day and are seen in the hairy areas as well as the palms and the soles of the feet Later they may be found on the buccal membrane, the posterior pharyngeal wall, the conjunctiva and one writer reports small hemorrhagic areas in the fatty and muscular tissue found at post mortem

"The lesions are at first macular and about one to two millimeters in diameter They are salmon colored and have a waxy glance Later the spots become larger and somewhat irregular Their color increases and they become slightly elevated They disappear on pressure during the first week, but later a constant brownish area remarks. brownish area remains after pressure During the second week a fine scale covers the center of the macule and during convalescence this

A
valuable
adjunct
to the
dietary
of infants
and
children

For years, physicians have regarded cod liver oil as the standard antirachitic. It is gen-

erally prescribed by physicians in the treatment of strumous and tubercular diathesis and other wasting affections

Maltine With Cod Liver Oil is thirty per cent cod liver oil Seventy per cent of it is an extract made up of the nourishing elements of barley, wheat and oats Rich in maltose, dextrose and dextrin, it is readily digested

As an adjunct to the dietary of infants and children—as an easily assimilated food, Maltine With Cod Liver Oil is preferred by many physicians to cod liver oil alone. It is a pure and dependable preparation. It is far more palatable than plain cod liver oil

ROCKY MOUNTAIN SPOTTED FEVER

A serious disease called Rocky Mountain spotted fever is endemic in the Northwest Colorado Medicine for February contains an article on the disease by Dr Carl S Gydesen of Colorado Springs, from which the following abstracts are taken

"Rocky Mountain spotted fever is an acute, endemic, non-contagious, febrile disease transmitted to man by the bite of the wood tick, dermacentor Anderson Stiles, which has been infected by an organism called Dermacentroxe-

nus Rickettsi

"Rocky Mountain spotted fever is intimately associated with the settlement and agricultural development of any region that harbors in-The most constant locality in fected ticks which the fever prevails in Montana is in the Bitter Root Valley in an area four to ten miles wide and fifty miles long In Idaho it has been reported along the entire north bank watershed of the Snake River"

"Man plays no part in the perpetuation of the virus, and in this way the disease differs from malaria, yellow fever and typhus virus is propagated in nature, first, by the infected ticks feeding on smaller wild animals (squirrels and rabbits) and infecting their hosts, while these infected animals, transmit the virus to other feeding ticks, second, through the hereditary transmission of the virus from an infected female to her eggs and then through the different life stages of the tick"

"The life cycle of the Dermacentor Andersoni is about two years. During the winter months the ticks lie dormant under logs and stones, but upon the appearance of the first warm days in the spring they crawl upon the grass, weeds and bushes from which they can easily attach themselves to the passing larger They lay from one hundred to sevanımals eral thousand eggs and then shrivel and die The larvæ hatch from the eggs in thirty or forty days if the weather is warm The larvæ stick in clumps to the ground foliage and await the passing smaller animals to which they at-They become engorged in tach themselves about five or six days and then drop to the ground where they lie dormant for three or four weeks before molting. The skin is then cast and the asexual nymphs are born form again attaches itself to a host, becomes engorged and falls to the ground where it lies dormant for three or four weeks while the metamorphosis into the adult form takes place"

"Two types of Rocky Mountain spotted

fever are recognized depending upon the sever ity of the disease and the mortality rate The Bitter Root strain is exceedingly virulent and it is rare for an adult to recover Statistics The Idaho indicate a 90 per cent mortality strain is decidedly less virulent and the mor tality seldom exceeds 5 per cent Botanical and climatic conditions probably explain this great difference in mortality. In the Bitter Root Valley of southwestern Montana the win ters are severely cold and long The summers are mild and the tick infested areas are gener ally shaded and moist Here the larvae and nymphs feed on the Columbian ground squrrel and the adult ticks attach themselves to the domestic animals Along the Snake River in Idaho the summers are very hot and dry On these dry sage brush plains the jack rabbit is the principal host for the infected ticks Later investigations have shown that ticks which have been well fed will produce the dis ease much more readily in guinea pigs than the unfed ticks will"

"The disease usually infects persons whose occupation takes them into the sage brush and mountainous regions, such as stockmen, min ers, shepherds, prospectors, lumbermen, hunt-

ers and summer tourists"

"The incubation period varies from five to ten days with an average of seven days During this time the patient complains of malaise, chilly sensations and has a slight evening tem-Then an abrupt chill occurs and it is followed by a temperature of 103-104"

"On the third, fourth and fifth days the characteristic eruption appears It develops first on the ankles, wrists and forehead and then spreads to the rest of the body The lesions are scattered at first, but they become more numerous on each succeeding day and are seen in the hairy areas as well as the palms and the soles of the feet Later they may be found on the buccal membrane, the posterior pharyn geal wall, the conjunctiva and one writer reports small hemorrhagic areas in the fatty and muscular tissue found at post morten"

(Continued from page 352)

results in a desquamation that involves the entire body"

'The diagnosis of Rocky Mountain spotted fever in the regions where it is endemic is not difficult. Even the laity recognize it. It appears after the first warm days of spring in regions known to be infested with the infected wood ticks. Also the history of the tick bite, the malaise, muscle and bone pains, the head-iche and chill; followed by a temperature of 102-104, and the characteristic rash appearing irst about the wrist and ankles are the outstanding features of the disease."

"In the reports of the USPHS for 1926 he work of Spencer and Parker at the field station at Hamilton, Mont, is reported. They lave developed a prophylactic vaccine against Rocky Mountain spotted fever and have tested to value by administration in selected areas and checking results. In 1925 two men who had received but one-fourth of the dosage considered likely to give full protection later contracted mild infections and recovered. These recoveries were the only two among seven Bitter Root valley cases during the season of 1925, and also the first two records of recovery imong laboratory and control workers."

"The production of the vaccine which is nade from infected adult ticks, requires nearly ifull year. It involves the engorging of hundreds of female ticks, the feeding of hundreds of thousands of the resultant larvæ on infected losts, and the rearing of these through the lymphal stage to adults. It is in the adult tick hat the highly virulent virus essential for a patent vaccine most consistently occurs."

CIGARETTE TESTIMONIALS

The editorial by Mr Lloyd Paul Stryker in the legal department of this Journal of November 15, 1927, page 1264, was widely copied in the State Medical Journals. The January issue of California and Western Medicine not only printed quotations from the article and a letter of commendation, but it also ran the following editorial.

"Adverse comment in state journals has been rife concerning the recent scheme of a cigarette firm to foist upon the public the unthinking endorsement of a few physicians throughout the country as the studied and scientific research results of the medical profession

"It is regrettable that any physicians should have thoughtlessly lent their support to this advertising scheme. The profession that has studiously worked to protect the people from

More Convenient— More Economical— Greater Therapeutic Range

DISTINCTIVE features make the new Battle Creek Super Solar Arc Lamp noteworthy for its safety, efficiency, economy and broad therapeutic range. The automatic magnetic feeding of the carbons insures the largest arc possible with the given current. The current is perfectly utilized, and the use of 12-inch carbons minimizes loss of time and delay

Ease of adjustment to any desired position and the means of locking the lamp in place make this appliance most satisfactory for general use Power is variable in the Super Solar Arc. The rays may be concentrated to produce caustic effects, or toned down to reproduce mild sunlight The combination of ultra-violet, infra-red and other light rays produces a spectrum that most nearly approaches that of natural sunlight

Solar erythema can be produced with the Battle Creek Super Solar Arc in six to eight minutes, when desirable Occupying a minimum of space, due to its upright position, the lamp may be easily and quickly moved in adjustment to the patient

The new Super Solar Arc Lamp employs many advanced features in construction May we send you our new bulletin, completely describing this efficient appliance?

MEDICAL ETHICS

The Atlantic Medical Journal for February has an editorial on the practice of medical ethics, in which the editor says

"We have previously called attention in our editorial columns to the fact that too often suits have been instituted for alleged malpractice based upon the comments and opinions given by physicians in criticism of the medical attendant who was in charge of the patient at the time. We have been advised of this in numerous cases by the attorneys bringing suit

"A recent instance may be cited of a primipara in charge of the attending physician, a general practitioner, who explained to the husband the difficulties experienced in the delivery and the reason why the baby was born dead. The husband was not satisfied and called at the office of an obstetrician to seek his opinion, giving the details as related to him. The obstetrician stated that he saw no reason why the baby should not have been born alive. The husband paid the \$20 office fee exacted, and deemed it only fair to seek another opinion. He consulted another obstetrician, who gave a similar opinion.

"It seems almost unbelievable that any physician would sell, let alone venture, any opinion in this manner. Here is a layman, with the mental anguish of losing his firstborn, due to what he thought was faulty obstetrics, consulting two obstetricians, who based their opinions upon the statements made by the layman in an overwrought frame of mind. Neither obstetrician had heard the details from the medical attendant. Such action on the part of any physician cannot be too severely condemned.

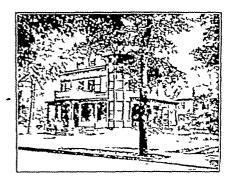

"It would seem justifiable, in any instance of this kind, when the charges are proved to be true, that said physician, if a member of a county medical society, should be made to show cause why he should not be dropped from membership. It may be that pitiless publicity may force a better observance of the principles of medical ethics."

fraudulent claims of drug advertisers should be more alert and discerning

"With all the criticism that has been roused against unscientific endorsement and all the publicity that has been given the careless signature of a circular letter by some thousands of the doctors of our nation, it is hoped that never again will a single signature appear until the signer has incontrovertible proof that the claims he is endorsing are findings made after actual scientific investigation"

ATTENDANCE AT COUNTY MEDICAL SOCIETIES

Many county medical societies of Pennsil vania publish their own monthly bulletins and some print the record of each member's at tendance at the meetings The Atlantic Medical Journal for February, commenting on one of the bulletins, says editorially

"The enterprising editor of a county society bulletin recently published the attendance record of all members of his society. The score runs as follows

Number of meetings attended	Number of member in attendance
0	60
1 2	26 13
3	11
4 5	8
6 7	6
8	1 2
9 10	6

"It is rather appalling that neraly half the members failed to attend a single one of their county society meetings, and that only about a third of them attended more than two meet ings The competition between the many med ical meetings is frequently given by members located in large cities as an excuse for frequent absence, but in this particular instance there is only one other competing medical organi zation, whose meetings alternate with those of Yet eleven members of the county society both organizations failed to attend a single The average of the meeting of either one county socnety attendance was 33, while that for the other organization was 63-a difference accounted for perhaps by the presence of ? guest speaker at the latter meetings One of the most distressing features of the record is

(Continued on page 357, adv xv)

THE INDIAN TEEPEE

The Wyoming section of Colorado Medicine, ne organ of the Medical Societies of the states of Colorado and Wyoming, has the following ditorial entitled "The Big Sleep":

"We pride ourselves on our education, and et a large part of these boasted achievements re in reality bunk

"Take the question of sleep

"The western Indian knows more of the real oys of sleep than all the rest of the so-called avalized world

"That's a strong statement, but you can prove it to your own satisfaction, if you will but try his way

"No million-dollar palace has in it the lifegiving sleep an Indian teepee offers its owner. Man invents what he thinks are improvements in the way of living only to find that these so-called improvements are in fact disadvantages and only tend to shorten his life

"For years the Indians knew no other home than the teepee, and yet as soon as the government insisted on his building and living in houses the death rate among the Indians began to increase, and it is still on the increase

"The Indian teepee made of canvas or even thin muslin is so far superior to any modern tent that there is no comparison. If you can get one do so by all means and enjoy sleep as you never have before

"On account of the ventilator at the top where the poles cross and the upward current of air through it no flies or mosquitoes are ever found in a teepee. The air is always fresh, yet free from draughts

"Get an Indian teepee and enjoy the big sleep After five years' sleeping in an Indian teepee we certainly can recommend one for every family We are not agents for them, but we do know your lives will be happier if you enjoy one in your own back yard Why not enjoy the big sleep?"

The author might have mentioned a feature which promoted ventilation without causing drafts. The Indian teepee in the American Museum of Natural History, New York City, has a curtain looped to the tent wall on the inside of the teepee about five feet from the ground and falling to the floor. This prevents drafts on the floor and produces an upward current that insures fresh air around the sides even when a fire is burning in the middle of the floor.

How Many Times a Day Do You Wash Your Hands?

Patch's Nepto Lotion

will keep them soft and smooth

Surgeons, Physicians and Nurses are obliged to wash their hands very frequently Mothers, too, who have children to care for or housework to do, must have their hands frequently in water.

Must have their hands frequently in water

You know how hard it is to keep them from
chapping during the cold weather Here at last is
the lotion that gives the desired protection

the lotion that gives the desired protection
NEPTO LOTION is different from other lotions
It is made with a base of Irish Moss, combined
with glycerin and alcohol in just the right proportions to keep the skin soft and smooth. It relieves
chapping and protects the soft texture of the skin
Just a few drops of NEPTO LOTION, applied

Just a few drops of NEPTO LOTION, applied right after drying the hands, will work wonders! You'll be surprised how soft and pliable your skin will keep

OBSERVING THE CRIMINAL

The editor of the Medical Journal and Rec ord, writing in the February first issue of the periodical, suggests that murderers be kept He supports hu alive for scientific study view with the following argument

"Efforts to prevent crime depend largely upon an understanding of the criminal mind, a knowledge of the abnormal psychology which results in asocial acts To this end are labor ing the criminologist, the psychiatrist, the sociologist, the psychologist Legal acts of revenge and punishment serve only as stumbling blocks in the path of scientific investigation. One cannot study the mentality of a dead man, yet the voice of the public cries out against the preservation of a human life when that life has culminated in an outrage against the funda mental feelings of the race

"Whether the perpetrator of an atrocity be sane or insane, whether he be responsible or irresponsible, make interesting subjects for debate, but are of little practical importance The essential point is to deal with him in such a manner that he will never again be a menace to his fellowmen Killing him accomplishes the desired result with gratifying finality Thereafter he is no longer a source of danger-but neither is he of any use. The thorough study of a personality capable of committing a revolting crime, glorifying in the resulting publicity, pointing pridefully to himself as a note worthy "bad example" to the youth of the com munity, in other words, behaving in a thor oughly abnormal and perverted manner, ought to bring to light a quantity of valuable mate Securely incarcerated and forced to be come a more or less useful member of the in stitution community, he may be a veritable mine of psychopathological data from the day he is sentenced to the completion of his au To be sure, one or two isolated cases mean little and generalization therefrom would be dangerous What is needed is the preserva tion of the criminal as a specimen for scientific If his crime is such that the investigation herd howls for his blood, so much the more vital is it that he be kept alive with the care and solicitude accorded an experimental ani To society at large, he has ceased to exist. To the scientist he is a rare and valu able specimen, available for study and expen mentation from every angle known to the stu dent of aberrant personalities"

LEGALIZED ABORTION

The February issue of Colorado Medicinc ays editorially

"Russia, unafraid of experiment in government, has formed a commission for considering petitions of women who, for any cause, desire abortion Eighty-three percentum of these petitions have received favorable action. In three rears 55,320 authorized abortions have been lone. In this great number there was no faality. The operations are all free and are done in government hospitals. Within the same opened the authorities of Russia learned of 56,675 abortions done by bunglers with 3,000 leaths.

"Not satisfied with the results of its trial of tree abortions, Russia is now more actively teaching birth control and is experimenting with new methods of prevention. In all European countries there is increasing activity in teaching birth control. The United States is alone in forbidding the use of the mail to writings favorable to contraceptive methods. We, in a land of the free, practice the principle that the government must decide what the people may be permitted to know."

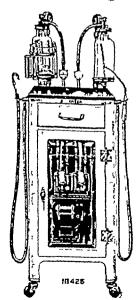

ADVERTISING STANDARDS

The Medical Society of the State of New York chooses its advertisers according to the same standards that are set forth in the following brief editorial in the Wisconsin Medical Journal

"With names of physicians ('selected') for sale at \$9 50 a thousand and an American Medical Directory for sale at \$1500, it is little wonder that the mail of the doctor is increasing Every firm whose advertisement is rejected by this Journal and others generally resort to direct-by-mail appeals to use this, try that or simply sign the card for samples. Even Bernarr Macfadden uses this direct appeal in an effort to get testimonials

"Your dues could be cut in two if this Journal accepted all the advertising that is profferred. The Journal, with a sense of responsibility to its readers, will continue to select, to require proof, to reject. And its advertising columns will prove increasingly valuable to the readers as a guide to reliability of firm and product."

SALIPYRIN "Riedel"

is a chemical combination of antipyrin and salicylic acid. The thera peutic effects of both these components are preserved, although modified by close chemical union and in a very great degree deprived of the dangers of mechanical mixtures.

Salipyrin is distinguished from other salicylates by the comparative

freedom from ill-effects (absence of free antipyrin) and prompt antipyretic and sedstive action.

INDICATIONS Influenza, Colds, Catarrh of the Nose and Throat, Rheumatism, Neuralgia, Alcoholic Excess, Pleur isy, Dysmenorrhea, Metrorrhagia, Vaginitis, etc. If given early in the attack, Salipyrin generally succeeds in aborting colds

Salipyrin is supplied in powder form and as SALIPYRETS in tablets of 7% each.

Approved by the Council on Phar and Chem. of the American Medical Association for inclusion with N N R.

RIEDEL & CO., Inc.
Berry and South 5th Streets, Brooklyn, N Y

RELIGION AND SCIENCE

Harry Emerson Fosdick, DD, the champion of modernists in the pulpits of New York, has an article entitled "Religion's Debt to Science" in the March issue of Good Housekeeping The following extracts refer to the physicians' part in promoting true religion among mankind

"When people talk about conflict between scence and religion as though that were the gist of the matter, we would do well to think of the triumphs of scientific medicine. We ought to speak of that oftener in places where the heroes of the race are remembered and the servants of humanity are put into our inward halls of fame. Our missionary enterprise has produced great souls and we know the roster of their names Paton of the New Hebrides, Morrison of China, Judson of Burma, Livingstone of Africa Bot we do not know so well that scientific medicine also has its roster of heroes who well deserve to stand beside them

"Conflict between science and Christianty? Think of Lister's work in antiseptic surgery, Morton's work in anesthetics, Jenner's work in vaccination, or the new antitoxins that are stealing terror from old scourges like diphthena. Would not Jesus rejoice, who cared so much for the bodies of men and spent so much energy upon their health? I say it reverently, he healed a few people after the manner of his day, but how grateful would he be if, coming back, he should see science now fulfilling his own words, 'Greater things than these shall ye do'

"This last year I visited ancient Corinth in Greece Thither, late in the last war, an astonishing American woman had brought two thou sand children from the carnage and chaos of Asia Minor There in Corinth in old Greek army barracks she installed the children few weeks twelve hundred of them had malana Malaria had been there for centuries Historians say that it caused the disintegration of ancient Greece One thinks of all the prayers that have been offered from old pagan shrines, from Chris tian churches, from Moslem mosques against this insidious foe. But now we have new tools to That American woman sent to work with Athens for a trained nurse from Johns Hopkins, who was there She threw her scientific knowl edge into the problem, would not leave a single pond uninvestigated, became a nuisance to the government until it joined forces with her She cleaned up the entire countryside until not a single case of malaria was left Now there need never be any malaria in Corinth again Conflict between science and religion? As one thinks of these new tools in the hands of the spirit of sen ice, such vistas open as never hitherto have opened before the hopes of man"

THE OBSTETRICAL EXAMINATION

The January issue of The Comnd of Medicine and Surgery ublished in San Francisco) conns an editorial on obstetrical actice in which the author enuerates the following six items of amination which every physiin should be prepared to make

- 1 The use of the pelvimeter d thereby a certainty that the lvis is of normal size. The easurements are easily memored, interspinous, 25 cm; interistal, 28, intertrochanteric, 31, 3ht oblique, 22, left oblique, 22, ternal conjugate, 19, and transrise at the outlet, 11. Note that arting with 25, it is subtracting ree each time. Buy this instruent before you invest money in pair of forceps, it is more seded.
- 2 The presentation of the child presentation in the sense of its planty—is it head or breech? his is not hard to determine ven in the very fat the head can a palpated in the lower crease to determined any time during the list few months it will not change efore labor starts and rarely then
- 3 The position of the head—thether LOA or not This requires a little more skill which is asily gained. The head at the elvis can always be felt and the osition of the hard occiput determined. Palpation of the back will all to which side the occiput lies. The placenta always lies to the entral side of the baby.
- A Locate the placenta by sound thich is very much easier than locating the fetal heart. It is synthronous with the maternal pulse thile that of the heart is more apid, about one hundred and lifty. If it is low there is a possibility of hemorrhage from the terus failing to contract and one is thereby prepared for trouble
- 5 The fetal heart is heard prough the back and upper shouler. If it is low, the head is ownward, if high, one may suspect a breech presentation. It iso tells one that the baby is alive.

Poland Water

of The relative size of the head with reference to the pelvis. There has never been devised any satisfactory way of measuring this. The experienced and skilful hand will become a good guide. One can also learn to estimate the flexion; degree of hardness, and ability to pass the superior straight."

AN OCCUPATION FOR THE RETIRED PHYSICIAN

Be prepared to turn your hobby into a productive enterprise. This is the gist of the following editorial advice given in the Atlantic Medical Journal for January.

"We doubt if there is a physician in practice for any considerable number of years who never to himself has said 'If only I could retire!' But what to do if he does retire—that is the question The report, recently issued, of the Bureau of Plant Industry, U S Department of Agriculture, drops a hint to all who have agricultural inclinations Wide newspaper publicity has been given to certain spectacular searches after rubberproducing plants which can be grown in the United States The Department, however, has not been confining its efforts to rubber One of its successful ventures has been the establishment of Japanese mint as a crop in the United States in order to provide a domestic supply of menthol Another has indicated the feasibility of growing santonın ın California and Oregon, and perhaps other states This effort to make our country selfsustaining in an agricultural and botanical sense is one of the most fascinating hobbies which any physician could take up In addition, it will provide him with healthful exercise, and a possible vocation when he is ready to retire from practice. Some one has said that your hobbies should always be possible of development into productive enterprises in case of need. This is one worth looking into"

Tropico Sun Lamps generate CONSTANT energy—giving any desired amount at any time. The carbons DO NOT DETERIORATE. When they are used up, simply replace them with new ones. This output of CONSTANT energy enables the physician to prescribe accessful dosage—the energy is the same whether the lamp is one hour old or 1,000 hours old. This is a pronounced advantage over the use of the mercury are type of lamp where one has to contend with a constant deteriors tion of the burner and consequent variation of the ultraviolet output.

Another tremendous advantage of the Tropico Sun Lamp is the ability to vary the spectrum at will. The carbons used in the lamp are impregnated with different minerals. By varying the character of the mineral impregnated, the emission can be varied. Thus we supply you as standard equipment with "A" carbons for general treatment and also "B" carbons which are rich in short ultraviolet rays for use where deep crythema is indecated.

LOCALIZER APPLICATORS—FREE TREATMENT BOOK

LOCALIZER APPLICATORS—FREE TREATMENT BOOK

Each lamp is furnished with a protective screen, localizing attachment, and applicators. For general treatments the lamp is used with the reflector open to its full circumference. For local or orifical treatment, three different sized applicators are furnished. Also we send you FREE our Handbook of Technic with each lamp which enables you to start using the lamp at ONCE.

EASY TERMS - FREE TRIAL

We will send you this handsome lamp complete with built in resistance unit, localizing attachment, screen, applicators 50 "A" and 50 "B" carbons goggles, and FREE Treatment Book for 15 days FREE TRIAL in your own office upon a down payment of \$20

Convince yourself by a trial in your own office. If not absolutely satisfied, return the lamp to us and we will refund your money If you keep the lamp, send only \$18 per month for ten months. To those who wish to pay cash we offer a saving of 10% (\$20) if check is sent with order

TROPICO SUN LAMPS ARE SUPERIOR BECAUSE

They employ TWIN ARCS giving you double efficiency

They are absolutely AUTOMATIC-to start, you simply press the button

They are UNIVERSAL—will operate on 110-volt current either A C. or D C. They furnish you with a CONSTANT SOURCE

of ultraviolet energy They are PORTABLE—weigh only 35 lbs and

can be carried to patient's bedside
They use PRESCRIPTION CARBONS that

enable you to vary the spectrum at will.

No 7159-TROPICO SUN ULTRAVIOLET CARBON ARC LAMP-Complete as described, including elaborate Treatment Book FREE ONLY \$200 Less 1 ONLY \$200 Less 10% for Cash

CANCER DEATH-RATE VARIATIONS IN RELATION TO COMBUSTION PRODUCTS OF FUEL, TOPOGRAPHY AND POPULATION*

By JEROME MEYERS, M.D., NEW YORK, N. Y.
From the New York City Department of Health

ANCER death rates vary greatly in different countries and in different parts of the United States That for Switzerland for the period 1900-1909 was 1277 per 100,000, for England and Wales, 90, for the United States, 72, for Italy, 57, for Servia, 105, for Ceylon, 51. Considering a single country, the United States, the rates for the registration states according to the 1920 Census are almost as startling Table 1 shows the adjusted cancer death-rates for the registration states according to the 1920 Census, the Southern states, New York and Pennsylvania being for white population only

	Death-raie		Death rate
State	per 100,000	State	per 100,000
Mass	97 9	Wash.	768
Conn.	929	Del	.75 1
NY	92 5	Neb	74 3
Minn.	92 1	Ind.	72.7
R. I	88 5	CoL	71 1
III	87 5	Mo	<i>6</i> 7 5
Cal.	87 1	Kansas	63 4
NI	86 9	La.	623

Wis	78 1	Miss	480
Mich.	78 1	s c	458
Ohio	77 7		

Considering now different cities in the United States, the 1920 census reveals widely divergent crude rates

Cambridge, Mass	164 6
San Francisco, Cal	151 2
Albany, N Y	144 0
Hartford, Conn	141 4
Los Angeles, Cal	135 3
Houston, Texas	65 6
Detroit, Mich	628

^{*} Read at the Annual Meeting of the Medical Society of the State of New York at Niagara Falls, May 11, 1927

This paper as published is a condensation of the original. The various omitted tables are available from the author

Youngstown, Ohio	609
Birmingham, Ala	590
Akron, Ohio	409

Within a single state, cities show marked variations Within New York State the 1920 crude figures show

Albany	144 0
Rochester	114 4
Buffalo	. 97 3
Syracuse	. 944
N Y City	. 943
Yonkers	869

The average crude cancer death-rates for the city of New York and for the boroughs are as below

Persod	Manh	Brone	Brooklyn Quee	ns Rich	N Y City
1911-1920	94 4	87.2	82.2 77.		88 0
1920-1924	1104	946	916 99.	3 101 3	100 4

C E Green, as a result of investigations in Scotland and England, showed some marked differences in the death-rate from cancer even in comparatively small areas In Scotland he found rates running from 176 per 100,000 in Kinsing Park, a suburb of Glasgow, to 973 in the rural districts of Nairnshire In London he states the rate is 1-7 for all deaths in the Strand district, while, in Stepney, it is only 1-54 He also found that, in the County of Nairn where there was the highest death-rate, there was one area of 100 square miles with 1,000 inhabitants where he could obtain the record of only one case of cancer, a rodent ulcer He further points out that the rate in the Orkney Islands was generally low, but that three islands showed a high rate. In these three, peat approaching the composition of coal was used He also calls attention to the known facts that epithelioma is very prevalent among chimney sweeps who show the highest rate for any occupation, also among gardeners or farmers who use soot, and that cancer is known to be frequent among workers in aniline dyes, paraffine,

will constitute an important part of our study of the incidence of cancer on the whole island

On the Jersey shore opposite the northerly shore of Staten Island, on that peninsula which extends from Constable Hook to Bergen Point and which is separated from the north shore of the island by the comparatively narrow channel of the Kill van Kull, there are and have been for many years at least 25 great industrial metal-refining, chemical, and oil-refining plants with many more chimneys and stacks (See Photograph I) Here for years has been a concentration of plants from which great volumes of smoke, vapors, gases and fumes have originated

from these plants that would extend over a large section of Richmond County

The annual report⁷ for 1913 showed analyses of air for sulphur expressed as SO₃, made on the Jersey side, on the island side with wind from the north and also from the south, and also ¾ of a mile distant from the shore-line. All show distinct sulphur content, and one test showed more sulphur ¾ of a mile distant than at shore-line

An investigation of smoke, fumes and gases emanating from plants on Constable Hook and their effects on the opposite shore was made in 1908 by the Lederle Laboratories. By the

View showing large numbers of climnizs and stacks with smoke and fumes on Jersey side as seen from Thyssen Street and Richmond Terrace at Kill von Kill. At the extreme right can be seen whole batteries of stacks used in the refining of oil. November 13, 1922

In 1908 the State of New York acted on a complaint made by residents of Staten Island that "within the State of New Jersey and the City of Bayonne, at Constable Hook in said city that there are now maintained and operated certain extensive plants, furnaces, smelters, ovens and other appliances engaged in the manufacture of chemicals, refining of oil, roasting, reducing, smelting, manufacture and production of sulphur, copper, ores and other products, and that such manufacturing plants are constantly generating quantities of noisome and disagreeable smoke, fumes, effluvia, noxious vapors and gases which injure and endanger the comfort, repose, health and safety of a considerable number of persons, citizens of Richmond County"

The northerly part of Richmond County, which it is claimed as more affected by these conditions, includes that portion of the community formerly known as New Brighton, West New Brighton, and Port Richmond The population affected resides on the northerly slope, the more thickly settled portion of which extends back for a distance of about 5,000 feet from the Kill van Kull

The investigation made on this complaint was largely a physical one together with a study of meteorological and barometric records. It could be positively said that gases and fumes could be detected by sense of sight and smell for distances

courtesy of Dr Pease, the writer has had access to the original report and files of this investigation. It shows that, even as far back as 1880-1883, an investigation was made by Dr Hallock in conjunction with the Departments of Health of New York, New Jersey and Staten Island. The conclusion was that injurious and unwholesome fumes affected certain sections of the north shore.

The Lederle Laboratories made an analysis of leaves from Staten Island and compared the findings with those of leaves in the northern part of the Borough of Manhattan, as follows

Staten Islan	i	Jerome Ave (Manhattan)
Sulphur trioxide Arsenic	0 602 % 0 02 %	0.337% Trace (due to HCL used)
Copper Lead	0.22 % 0 0104%	None None

It was estimated from investigations and analyses that from five sources alone at least 13,622 lbs, or 631 tons of SO₃ were liberated each day, or 2,303 tons per year

Although conditions on every day in the year would not be such as to allow the full smoke and fume output of the Jersey shore to drift even in part over the island, it must be noted that from November 1, 1906 to June 24, 1913 (see New York State Annual Report, 1913) 44% of the days showed the wind from the north, 21 8% had in addition the wind from the north or north-

gas pitch, brewers and metal workers who use sulphuric acid

His theories as to the causes of the variations in cancer death-rates are

(1) That where the death-rate is low we have a low or high area comparatively flat or at most with low swelling undulatory hills with houses built on the sides, whereas those sections with a high mortality are intersected by gulleys or valleys with houses in the hollows, or the whole section is in the hollow or cup or depression surtounded by higher land

(2) The excessive presence of SO₂ gas from the use of coal with a high sulphur content was present with the highest incidence of cancer. In all the Orkney Islands except three the death-rate is very low. Peat is used in all the islands. In the three islands with high rates, it was found on analysis that the peat used had 0.75 or more sulphur, approaching the sulphur content of coal.

(3) That uneven roof-lines such as we find in the Strand district with its death-rate of 1-7 cause poor house or chimney ventilation with an insease of SO₂, while a level roof-line as in Stepley with a rate of 1-54 affords opportunity for excellent ventilation with little accumulation of

Additional data to support Green's theory of the relation of combustion products to cancer are found in his article² published in 1915. They are based on maps by J. Bertillon³ who states that, if a line be drawn from La Rochelle to St. Etienne and from there to the Rhone, the square formed by these lines and the Rhone, the Pyrenees and the seas, does not contain a single department where cancer is frequent. Whereas, if a square be made having the sea on the west, and lines from Caen to Angers, Angers to Dijon, Dijon to Mézières, in every department inside this square, cancer is highly prevalent, the death-rate per 100,000 being four or five times as great as that in the square or territory in the south. Each square comprises about one-third of France

Bertillon confessed that he could give no adequate explanation of the great differences in these cancer death-rates. Green then sent a questionnaire to the Prefect of each of the departments of France, asking information as to the form of fuel used in his territory. He found that in the northern square or area, where the rates were high, coal was used, while, in the southern area, wood was burned. Even in the north in Brittany the rates were low and here wood is used.

Green concludes "Some other element than strictly sulphur content may be involved in the relationship of certain fuels to cancer death-rates of the districts in which they are used. Some chemical condition of the fuel, its ash, or its other products of combustion, may be responsible.

Interesting and intimately connected with the question of cancer and the combustion products of fuel are the well-known experiments of Yama-

give and Ichibawa and a long line of other workers. These successful efforts to produce cancer by the application of coal-tar to the skin of rabbits and mice need no discussion or amplification here. Very recently, Passey and Carter-Braine, using white mice, have succeeded in producing epithelioma with an ether soluble product from ordinary fresh household soot from a bituminous coal

A very recent investigation of the relation of coal and oil combustion products to cancer has been made by Kennaway⁵ and 1s important. In a most exhaustive report on the relation of coal and oil combustion products to cancer, he summarizes his work on gas-works tar as follows The industrial evidence alone shows that the cancer producing substance is present in the higher boiling fractions namely, creosote oil, anthracene oil and pitch, the experimental evidence supplements this by showing that the substance is not concentrated in the solids suspended in anthracene oil and that it is present in the highest boiling distillate obtainable from pitch Hence it may distill over through an interval of temperature extending roughly from 250° to 500° C

Thus with these cancer death-rate variations, the experimental, clinical and chemical findings as regards tar, and the possible relation of combustion products to cancer in mind, it seemed that it might be of value to make a cancer survey of some part of Greater New York After consultation with Mr Frederick Hoffman, statistician of the Prudential Life Ins Co, a survey of the Borough of Richmond or Staten Island was This survey begun on November 20, 1920 covered the seven years of cancer deaths in the These years were especially period 1914-1920 chosen as they were recent and included those of the war and directly after when immigration was practically at a standstill and labor and social conditions were such as to make for a highly stable population The borough chosen is ideal for an investigation along the lines indicated It presents, firstly, a varied topography, and secondly, much of its northern shore has suffered for many years from smoke, fumes and vapors from the great oil refineries, and chemical, metal and other works situated on Constable Hook, Bayonne and adjacent territory, which stretch opposite for miles along the Kill van Kull

Staten Island is in shape an irregular triangle (see figure 1) 13½ x 7¾ miles. Its south coast faces the wide and open waters of the Lower Bay, its eastern side, which is small, lies on the Narrows, its western is separated from New Jerey by the comparatively narrow Arthur Kill, while the northern side is separated from Constable Hook and Bayonne by the waters of the Kill van Kull, about 1400 feet wide. It is this northern shore, with its local industries and the great plants on the opposite Jersey side, which

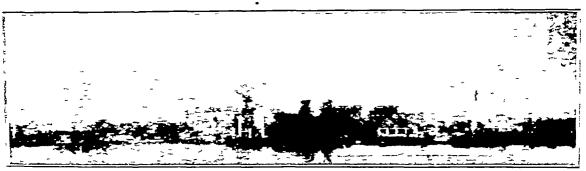

الله معانية عن المستعمر وعد والمستعمر والمستعم والمستعمر والمستعمر والمستعمر والمستعمر والمستعم

On the Jersey since opposite the numberly since of Sman Island on that periodic which extends from Constable Hook to Berger Point and which is separated from the north since of the island by the comparatively marrow cleaned of the All van And, there are and have been for many years at least 20 great infustrial metal-relining, charmical and of-relining plans with many more chimners and stacks. (See Photograph 1) Here for years has been a community of plans from which great volumes of smoke vapous, gases and fitness have originated.

iron riese plants that would extend over a large sention of Richmond Commy.

The animal reports for 1913 showed analyses of air for sulphin expressed as SO₂, made on the Jersey side, on the Island side with wind from the north and also from the south, and also 34 of a mile distant from the shore-line. All show listing sulphin content, and one test showed more sulphin 32 of a mile distant than at shore-line.

An invertigation of smoke, furnes and gases emanating from plants on Constable Hook and their effects on the opposite shore was made in 1903 in the Lederle Laboratories. By the

The street larger of street sit street will doubt and street of force of letter site as see from Termin Sheet of Robinson Termin at KII on Edil. In the entered with our telescope at the total streets of street and with effect of the November 18, 1972.

In 1905 the State of New Yorks acted on a complaint made by residents of Staten Island that within the State of New Jerses and the City of Bayonne at Constable Hooks in said of that there are now maintained and operated certain extensive plants, furnaces, smelters ovens and other applicances engaged in the manufacture of chemicals refining of oil rossing, reducing smelting, manufacture and production of sciphur, other, cress and other products, and that such manufacturing plants are constantly generating quantities of misome and disagreeable smoke, itmes, effords, novirus vapors and gases which in the and endanger the comfort, repose, health and saidty of a considerable number of persons, others of Risimond County."

The noticely part of Redimend County, which it is claimed as more affected by these conditions, includes that portion of the community formed, known as New Brighton. West New Brighton and Post Richmond. The population affected resides on the nontherly slope, the more which settled portion of which extends back for a distance of about 5000 feet from the All yan And

The investigation made on this complaint was largely a physical one together with a study of meteorological and incommitte records. It could be positively said that gases and frames could be deterted by sense of sight and small for distances

courtesy of Dr. Pease, the writer has had access so the original report and files of this investigation. It shows that, even as far back as 1880-1885 an investigation was made by Dr. Hallock in conjunction with the Departments of Health of New York. New Jersey and Staten Island. The conduction was that injurious and unwholesome furnes affected certain sections of the north shore.

The Lederle Laboratories made an analysis of leaves from Staten Island and compared the findings with those of leaves in the nonthern part of the Borough of Manhattan, as follows:

It was estimated from investigations and analyses that from five sources alone at least 13,622 lbs. or 6.31 tens of SO, were liberated each day, or 2.503 tens per year.

Aithough conditions on every day in the year would not be such as to allow the full smoke and fume curput of the Jersey shore to drift even in part over the island, it must be noted that from November 1, 1906, to June 24, 1913 (see New York State Annual Report, 1913) 44% of the days showed the wind from the north or north-had in addition the wind from the north or north-

The conclusion was that injurious and unwholesome fumes affected certain sections of the north shore.

The Lederle Laboratories made an analysis of leaves from Staten Island and compared the findings with those of leaves in the northern part of the Borough of Manhattan, as follows

Staten Islam	ž	Jerome Ave (Manhattan)
Sulphur trioxide	0 602 %	0.337%
Arsenic	002 %	Trace (due to HCL
		used)
Copper	0.22 %	None
Copper Lead	0 0104%	None

It was estimated from investigations and analyses that from five sources alone at least 13,622 lbs or 631 tons of SO₃ were liberated each day, or 2,303 tons per year

Although conditions on every day in the year would not be such as to allow the full smoke and fume output of the Jersey shore to drift even in part over the island, it must be noted that from November 1, 1906 to June 24, 1913 (see New York State Annual Report, 1913) 44% of the days showed the wind from the north, 21 8% had in addition the wind from the north or north-

east for 1-12 hours, and of these 1593 days there were 500, or 30%, when wind and barometer were such as to cause smoke, gases and fumes to descend over part of the island and Kill van Kill And while conditions might vary with activities in the various industries and although betterments have occurred or some plants abandoned, these fumes, gases and smoke have unquestionably descended on the island from this part of New Jersey over a long period of years to the present time. Fumes and smoke from local Richmond plants are in no wise in such concentration, and are considered separately as is necessary.

In making the survey the complete records of all deaths during this period were examined at the Richmond Department of Health, and all deaths from carcinoma, sarcoma, or other malignant growths (collectively designated as cancer in this paper) were individually noted by name, street and number, age, sex, nativity, birth-place of mother and father, and length of residence on the island All cases that seemed of doubtful diagnosis, all that had died in institutions, all cases that could not show a residence on Staten Island for a period of at least three years before the time of death, were excluded. The latter condition, the three year period of residence before death, is of great importance, for, if a study of of local conditions is to be made, it is highly necessary to exclude conditions that might affect a cancer patient before coming to the final place of residence As the usual duration of cancer from the time of diagnosis to death is usually not greater than 1 to 2 years, it seemed safe and conservative to use this three year limit It should also be borne in mind that cancer cases dying in other boroughs of Greater New York, but residents of Richmond, were investigated, and when proper, were added to this study It should be especially noted here that the total in our list of cancer-deaths for this period bears no mathematical relation to official death reports, but is based on the writer's special restrictions In this way an attempt was made to group and to exclude cases on a scientific basis, for it must be evident that, if a cancer survey is to be made and anything of value deduced or proved, it must exclude nonresidents and include residents dying away from home, and must also exclude those who have not lived a length of time in the locality sufficient to expose them to the conditions there inherent Until this is generally done cancer statistics for any country, state, county, city or town must be intrinsically fallacious and confuse our whole view and aspect of cancer incidence. In the study, therefore, with the restrictions as made, there were in all 515 deaths at all ages from malignant diseases in the period 1914-1920 inclusive

Inasmuch as we wished to study the influence of topography on cancer incidence it became necessary next to divide the island into topographical districts or units. From a consideration of the

election districts of 1910 and 1915 and a study of the island topography and smoke conditions by Mr Schattschneider, then Topographical Engineer of the Prudential Life Insurance Co, the late Dr Joseph Shears, Sanitary Expert of the Health Department and the writer, Staten Island was divided into 13 topographical districts (see fig 1).

fig 1).
These 13 districts may be briefly described as follows

- 1 The north eastern tip of the island, embracing St George and part of New Brighton, fairly hilly, sloping down 75-100 feet to the shore fairly well populated, houses detached or semi detached, not particularly exposed to smoke and fumes.
- On north shore, sloping from height of 200 feet from Brighton Heights to Kill van Kull, embracing New Brighton and Sailor's Snug Harbor, well populated houses detached or sami detached, directly exposed to fumes and smoke.

Staten Island divided into thirteen topographical districts with the average annual corrected cancer death-rates per 100,000, 1914-1920, inclusive. The black spots show sources of smoke. Those of Staten Island are small industrial or power plants with usually one chimney Those of Bayonne are extensive industrial plants with multiple chimneys or numerous batteries of stacks

- 3 On north shore, sloping 200 150 feet to Kill van Kull, embracing West New Brighton conditions similar to district 2, exposed to smoke and fumes
- 4 Partly on north-shore and for a distance back of it, sloping from Richmond Turnpike 250 feet towards Jewett Avenue and Kill van Kull, conditions similar to 2 and 3, exposed to smoke and fumes.
- 5 On north shore, embracing Fort Richmond, sloping from Morning Star Road towards the east, a shallow basin sur rounded towards the south by low bills, quite densely populated, houses detached and semi detached exposed to smoke and fumes.
- 6 On north shore, comparatively level, especially towards the north with a ridge of 40 feet elevation along line of Linden Avenue sloping to shore, fairly populated houses detached and semi-detached, exposed at times to smoke and fumes.
- 7 A great stretch of more or less level territory with beginning of the central elevation of the island in its extreme south eastern part, sparsely settled, not particularly exposed to smoke and fumes, except at Lindeumville.
- 8 High, undulating country in the middle of the island with a height of 409 feet at Todt Hill and Ocean Terrace, not densely settled not directly exposed to smoke and fumes Embraces Grymes Hill.
- 9 A compact level territory backed by the abrupt rise of Grymes Hill, 90 180 feet high. Densely settled, not directly exposed to smoke and fumes

- 10 Has high territory of 8 toward the northwest with slopes and intermediate high land 130-150 feet elevation at its centre. Quite densely populated, houses detached and semi-detached not directly exposed to smoke and fumes.
- 11 A long and wide stretch of level land sloping from a height of 150 160 feet at the eastern half and 75 80 feet at the western half towards sea level, sparsely settled generally but quite densely in parts where there is a succession of towns with clevated land at their backs. Not directly exposed to smoke and fumes
- 12. A great stretch of territory similar to 7 towards Staten Island Sound but with some high land at Woodrow and aloping south towards Pleasant Plains Princes Bay and sea level Sparsely settled, occasionally exposed to smoke and fumes.
- 13 The extreme southwestern tip of the island embracing Totten ville, quite densely settled, houses detached and semi-detached, occasionally exposed to fumes of local copper works in its northern part.

With this topographical division into 13 districts which embraced 45 election districts established, the original sheets of the 1915 New York State census for Staten Island were procured, and with Mr Schattschneider and his force the entire population of some 100,000 was listed by age and sex for each election district, so that at the end there was obtained the population of each one of the topographical districts. The population by sex and by age groups of under 35, 35-44, 45-54, 55-64, 65 and over for each of these individual districts was obtained from original sheets of the 1915 State Census A corrected weighted deathrate, using the 1910 population distribution of New York City for a standard was then calculated and obtained Table III shows the corrected death-rates together with the probable error as follows, the probable error having been calculated by Mr Arne Fisher

•		
	Corrected weighted cancer death rate per	- 100 000 perio
District	1914-1920 inclusive,	nd probable erro
1	47.2	±48
2	60 5	±70
3	61 7	±57
4	706	±73
4 5	78 <i>9</i>	±50
6	61 7	±73
7	43 5	±60
8	429	±49
9	69 6	±44
10	55 9	±50
11	763	±75
12	42 1	±45
13	48 <i>7</i>	±71

A study of this table and the districts as shown in figure 1, which also gives the industrial plants on the island and the Jersey shore shows in these 13 districts distinct variations, ranging from low death-rates of 42 1 and 42.9 in Districts 12 and 8 to a high of 78.9 and 76 3 in 5 and 11. If the location of these districts is noted and compared with the rates, it will be found that at the northeastern point of the island or Dist 1 there is a death-rate of 47.2, but passing along the north shore the rate rises to 60 5 in Dist 2, 61 7 in Dist 3, 70 6 in Dist 4, 78 9 in Dist. 5, the highest on the island, and 61 7 in Dist 6. In Dist. 8, in the elevated central part of the island, the death-rate is only 42 9, while in Dist. 9 level ground

backed by elevated Dist 8, the rate is 69 6 In Dist 7, mostly level, the rate is 43 5, while in Dist. 12 contiguous to 7 and level, the rate is 42 1 Dist 11 shows a high rate of 76 3 The southwest tip of the island, Dist. 13, shows a rate of 48 7, almost the same as that at the northeastern tip, 47.2

At this point, an analysis of the per capita consumption in each of the registration states of bitumingus coals for 1917 and of anthracites for April, 1916-March, 1917, was made, together with studies of the density of population in each, the percentage of urban population and native whites of native population, whites of foreign descent, native-born whites and foreign-born from the 1920 census These would seem to indicate that anthracite coal used for domestic purposes shows a more steady relation to the adjusted cancer rates of these states than total coal for all domestic and industrial uses. Industrial coal does not follow the cancer rates closely The percentage of urban population rises with the increase of cancer, and where the rates are lowest, we have a preponderance of native whites of native parentage and of native born whites

These findings were applied to topographical districts 5, 6, 7, 8, 9, 11 and 12, as they showed the largest variations in rates and differences in topography and location. Various studies of the population composition in the districts for 45 years and over were made including different nativities. For comparison, a study of Manhattan for 1915, 45 years and over, both sexes combined, gave the Germans a cancer death-rate of 480 per 100,000, the Irish 511, the English 520, the Russians 411, the Austro-Hungarians 407, and the Italians 262

On Staten Island anthracite coal is generally used for domestic purposes except for a slight use of drift wood along the shore lines. There is then no basis of comparison between the individual areas as far as household coal itself in each area is concerned.

No important deductions could be drawn from our study of native born whites and foreign born whites, and it would seem that native born or foreign born whites, as a whole, have no great influence on our rates corrected in the various districts. This is not in accordance with the findings of Lyon in the Buffalo study where he reported the cancer death-rate among the foreign born at 4.59 times greater than among those born in the United States. But it must be borne in mind that he has used all ages and did not base his figures on 45 years and over

It would seem fair to say that it is only in three districts, namely, 5, 9 and 11 that any changes are necessary. Taking these three districts into consideration and the probable unavoidable errors in dealing with a series of 515 deaths divided into smaller groups as had to be done to make our study possible for topography, nativity and other

external factors, there could easily be allowed a possible error of 5 or even 10 per cent to be added or subtracted from the corrected rates and there would still remain distinct differences as before in the individual districts. It would seem that, if in any locality where there were a great preponderance of Germans, Irish or English alone among the foreign population, there could be expected a marked influence through such special excess, but where there are, as in the cosmopolitan city of New York, mixtures of Germans, Irish, English, Italians, Russians and Hungarians and other foreigners, there is much less influence of this foreign factor, as the high tendency of one group of foreigners would be counterbalanced by the low tendency of another group

As regards the possible relation of diet to the district cancer death-rate, there can hardly be a great diversity of diet on Staten Island. It is possible that in the case of the Italians this may be a factor and also possibly to some extent among the Germans and Irish, but as is seen above the entire factor of nativity does not seem to alter materially the rates. It is notable that District 8 with a wealthy class of residents shows the lowest rates on the whole island.

After a study by such writers as Hoffman, 11 Wilcox, 12 H Green, 18 and H G Wells, 14 it would seem that even with due allowance for better diagnosis, better vital statistics, concentration of physicians, and increased longevity, there remain other factors to be considered. Even if one-half of the increase of cancer deaths is explainable by the above factors, still in this half the question of environmental conditions as topography and smoke may be of importance. The other half of the increase concerning which Wilcox after exhaustive analysis is not certain would also be affected by such factors And even if the entire increase were thus explained, it would not mean that environmental and racial factors did not It is also cause cancer death-rate variations questionable if the factors advanced can adequately explain the reported variations in cities of N Y State for 1920, Albany 1440, Rochester 1144, Buffalo 973, Syracuse 944, New York City 943, Yonkers 869 It would seem that the number of doctors, diagnosis, vital statistics, longevity should not be so diverse in these cities within one state In fact, H Green13 states that the unsatisfactory correlation of a number of physicians to the cancer death-rates of the cities he studied can be explained by the fact that there are sufficient physicians in each of the cities available for correctly determining the cause of death It would be only after a study of these cities along the lines of Staten Island taking in account age groups, the elimination of non-resident deaths, topography, and housing and industrial conditions, that any final conclusions would be warranted It would seem that a closer and truer view of cancer factors can be obtained from a

study of a small compact area divisible into districts than from a consideration of states or countries. In a borough such as Staten Island, $13\frac{1}{2} \times 7\frac{3}{4}$ miles, divided into contiguous districts in which we can study comparative cancer death-rates, there cannot be great differences in medical and surgical diagnosis, or in reporting cancer deaths. Moreover, in such an area the physicians and surgeons see and diagnose patients from various districts

The question of the methods of house heating and of house ventilation are also of importance The following can be stated from information and estimates on these subjects as given by Mr Walter Walsh, Chief Sanitary Inspector of the Borough of Richmond, whose experience extends over a period of twenty years. The methods of heating on the island are by steam and hot water, which may be considered as one, by hot-air furnaces, and by stoves using either coal or wood It should be noted that the escape of combustion products into homes is more likely with hot-air furnaces and stoves It should also be observed that with hot-air furnaces the surrounding atmosphere is utilized in heating. Our individual districts show differences in heating methods and these differences have not altered to any material degree in the last 10 or 15 years except where new construction has occurred. It is interesting to examine the differences in the various districts District 1, corrected cancer death-rate, 472, has mostly steam and hot water, and not many hot District 2, rate 605, has 70% of air plants stoves, in which coal is mostly used, but wood to some extent District 3, rate 617, has 30% stoves with use of coal, the rest mostly hot-air District 4, rate 706, the lowest sections toward the Kill van Kull, stoves with coal, other parts, mostly steam and hot water District 5, rate 789, stoves with coal, 33%, steam, 33%, hot-air, 33% District 6, rate 617, stoves 70%, with some use of wood along shore District 7, rate 43 5, stoves 85%, but very much wood employed District 8, 429, mostly steam or hot water, possibly 5% hot-air furnaces District 9, 695, stoves with coal, 50%, hot-air, 20%, steam, 30% District 10, rate 559, stoves with coal, 50%, hot air, 25%, steam, 25% District 11, rate 763, coal stoves, 50%, steam, 35%, hot-air 15% District 12, rate 421, coal stoves 60%, some use District 13, rate 487, steam, 70%, of wood hot-air, 10%, coal stoves, 20% Mr Walsh 15 very emphatic in his statement that most complaints of back drafts and of defective hot-air furnaces in the last 10 or 15 years have come from District 5, which he says is low-lying He knows of no great complaint from Districts 9 It is noteworthy that again District 5, the or 11 highest cancer rate district, has many hot-air furnaces and coal stoves and has been the greatest source of complaint concerning house ventilation It is also noticeable that Districts 1 and 13, low

rate areas, show use mostly of steam heating District 7, a low rate area, shows great use of wood, while District 8, the lowest rate area, is almost entirely steam or hot-water heated tricts 9 and 11, both high rate areas show great use of coal stoves and hot-air furnaces District 10 shows high coal stove and hot-air use, but has not an especially high cancer rate The writer feels that this matter of house heating and its relation to combustion products and their spread to rooms is very important, possibly of as great importance as atmospheric distribution of smoke, gases and fumes from industrial plants surely not a negligible factor in the relation of burned fuel to the cancer problem Here in our districts are findings that would seem to have direct, even if rough, relation to the cancer deathrates in the light of our earlier discussions of the relative weight of coal and wood and their combustion products as one of the possible chemical causes of the stimulation of cells to cancer development

It would seem probable then, if we can reasonably exclude any great influence through the factors of native whites of native parentage, whites of foreign descent, whites of native birth and whites of foreign birth and the various nationalities as Irish, German, Italian, etc., among those of foreign origin, diet, differences in number of physicians and in diagnostic skill, and even make a liberal allowance in view of the comparatively small number in our cancer series, that the 13 districts show a distinct variation If then the above factors in cancer death-rates do not materially influence the death-rates or their comparative relation to any degree, the question arises as to what factors in the light of our present knowledge of cancer may be responsible for the high or low rates found in the districts

If the district rates are now examined, it will be found that Districts 1 and 13 have low rates and are not particularly exposed to smoke Districts 2, 3, 4, 5 and 6 are exposed to smoke and all show high rates, 5 being the highest Districts 7 and 8 are the lowest on the island and are not exposed District 12 has a low rate and is District 9, on the south only slightly exposed shore, is high rate and is not especially exposed District 10 is moderately high rate and not exposed District 11 is the second highest rate and not particularly exposed Districts 2, 3, 4, 5, 6 are then all exposed to smoke and show high Districts 1, 7, 8 and 13 are not exposed Districts 9 and 11 show and show low rates high rates and are not particularly exposed to industrial smoke or fumes

From the standpoint of house heating and ventilation and their relation to the cancer death rates, it is seen that Districts 1 and 13, low rate areas, show little chance for household contamination by fuel combustion products. Districts 2, 3, 4, 5 and 6, all high rate areas, show

distinctly greater chance for contamination, 5 being a special source of complaint. Districts 7 and 8, with low cancer rates, show use of wood and steam respectively. Districts 9 and 11, high rate areas, show more use of stoves with coal, while 10 and 12 moderately employ coal. The cancer death-rates as found then in our districts would seem in some districts partly explainable by exposure to smoke, fumes and gases, either from industrial plants or house-heating. This is especially significant in Districts 2, 3, 4, 5 and 6

Furthermore we have discussed fully the question of the possible influence of topography on cancer death-rates, showing that high level or low level open country seems to give low rates, while territory with many hills or valleys or in a cup or depression surrounded by higher land gives higher rates. Let us then see how this applies to the topographical districts on the island and their

corrected cancer death-rates

As described in the earlier part of this paper the north shore slopes toward Kill van Kull from a height of about 200 feet. This is particularly true of Districts 2, 3 and 4 District 5 showing the highest rate on the island really lies in a distinct cup or depression surrounded toward the south and southeast by low-lying hills therefore not only exposed to smoke, but presents a topographical condition making for increased cancer death-rates Districts 7 and 8 are level and high rolling territories respectively and show the lowest rates District 9 lies under the abrupt rise of Grymes Hill and thus presents an area distinctly dominated by an extensive high hill District 11, with the second highest rate on the island, contains its densest population in a series of towns such as Dongan Hills, Grant City, New Dorp and Great Kills, which are backed by land of comparatively considerable height, and here also in District II is a topography such as would bear out the theory of high cancer death-rate in such a terrain District 12 is an extensive, generally level stretch of territory The question of topography also is accordingly found important and conformable in our districts to the findings of Green This factor is especially notable in Districts 7, 8, 9, 11 and 12

Conclusions

- 1 There is a marked and interesting variation in cancer death-rates in different countries, within countries and states, and probably even in different sections of cities
- 2 On Staten Island, individual or parent nativity does not alter our corrected death-rates. In mixed populations, differences in cancer death-rates among Irish, German, English and Italian and natives tend to neutralize each other. Diet also was found of no great moment.
- 3 There may be an etiological relation between the incidence of cancer and topography, open level districts, of high or low altitude, show-

ing lower cancer rates than land in hollows or depressions or intersected by gullies, valleys, or lying against adjacent hills Albany and San

Francisco should make interesting studies

4 There may be an etiological relation between the combustion products of coal and oil Those sections of Staten Island exand cancer posed to smoke fumes and gases show a higher cancer death rate than those not so exposed House-heating and chimney ventilation are also important, as gases and fumes from these sources may bear a relation to cancer incidence as found in our districts

The better combustion of fuels in industry and homes, or the absorption of gases, smoke, and fumes to avoid atmospheric or room contamina-

tion, may mean less cancer

6 Whatever may be the possible errors in this study of a comparatively small number of cases (515), it cannot fail to show even on an island 13½ x 7¾ miles, divided into 13 districts, variations in cancer death-rates, and these variations would seem in the light of our findings to bear a relation to etiological factors of fuel and topog-These conditions therefore would seem to be a part of the complex etiology of cancer

THEORIES OF HYPNOSIS AND ITS USES*

By SIMON ROTHENBERG, MD, BROOKLYN, NY

THE comparative infrequency of finding hypnosis a subject of scientific treatise in American medical literature is perhaps accounted for by the fact that a certain stigma of charlatanism or, to say the least, a sense of irregularity attaches itself to the advocate of its uses And even in the eyes of the more scientific of the profession there exists an imputation of backwardness resulting in intolerance for its use as a means of healing

This prevailing scepticism toward the use of hypnosis is not altogether without reason for it so happens that the subject has been exploited by many people not of the medical profession, by men of the stage and by lay healers of questionable character who have capitalized the phenomena of hypnotism for their own private gain and brought the subject into disrepute The public has in consequence become wary of its use as The remedial medical a therapeutic measure value as well as the scientific development of this

*Read before the New Utrecht Medical Society of Brooklyn, March 1937

psychic phenomenon have remained barren of any progress in the hands of American medical men

In the light of the newer thoughts in this field, however, it becomes imperative that American medical men interest themselves in this therapeutic measure and realize its applicability and use-Ever since psychonanalysis has made its inroads into therapeusis, hypnosis has steadily been disregarded as a remedial measure in the treatment of functional ailments. At the same time there is a general admission on the part of psychoanalysts that the use of psychoanalysis is limited and restricted to a comparatively small portion of those suffering from neurotic condi-Freud's prerequisites for a favorable analysis demands, first of all, that the patients possess a certain degree of intelligence and edu-This requirement, therefore, lessens the sphere of application of psychoanalysis to the minimum few of the total number of neurotics seen in routine practice. Its applicability is further reduced because of the length of time reguired in order to cure the patient, and for that

large number of patients who visit the nerve clinics this factor precludes its use. Hypnosis, on the contrary, has its advantages over psychoanalysis in the ready facility with which it can be used and the frequently rapid cures which are obtained in a minimum length of time. This economic factor in its favor cannot be easily disregarded

In retrospect of the development of hypnotism it will be recalled that it was first known as magnetism when Anton Mesmer, an Austrian physician, came to Paris in 1778 under the patronage of Mary Antoinette and practiced the art of healing with magnets. From the period when it was first used in the treatment of nervous affections until its revival again by famous men in medicine and surgery, the phenomena of hypnotism ran across a rather dark vista of understanding and remained unproductive of advancement. Charcot, Richet, Libolt, Bernheim in France, Elliotson, Esdale, Braid in England, Heidenheim, Kraft-Ebing, Eulinberg, Forel and Moll in Germany, were the great exponents of this new art.

In this country, with the exception of Morton Prince and Professor Quackenbush, we have really never had any very great champion of hypnotism. The real progress in this scientific field was attained in Europe during the last 10 years as the result of the accumulated knowledge derived from investigations along psychoanalytic lines as well as from facts gathered during the various epidemics of encephalitis. Newly discovered strata of neurological material has led to further investigations, conceptions, and theories in the domain of neuro-psychology.

The use of hypnotism as a therapeutic measure for the many cases of war neurosis has also contributed much to the better understanding of the

phenomena of hypnosis

Men like Heyer, Aschner, Kauders, and Heilig, and the compilations of O Schartz in his book, "Psychogenesis and Psychotherapeusis of Bodily Symptoms," have made notable contributions to the subject of hypnosis

The elaboration on the function of the midbrain, inter-brain, and hind-brain by Lesche, Muller, Lewy, and Dresel, and the late investigations of the function and localization of the sleep center by Economo, Kauders, and Hoff, gave further impetus to the Vienna School of Psychiatrists, led by Schilder and his associates, resulting in the correlation of all this wealth of material, with their own theories and experiences of hypnotism into a textbook on hypnosis, just translated and published in English

The primary aim of Schilder and Kauders in writing this book was to embody in it a revival of interest in hypnotism and to attempt to harmonize the mass of biological phenomena with that of the newly gained knowledge of the psychological processes of mental life. To Schilder, more than to anyone else, must be given the credit for the effort in re-exploring this strange mental

phenomenon of hypnosis in order to illuminate the relationship of physiological function to psychological processes This Herculean task has been performed with singularly scientific percision and ingenious imaginative faculty part of the tremendous compilation of biological and psychological data can be given within the limits of this paper, nor can the variety of therapeutic application of hypnotism to disease processes as given in his book be here described stupendous work of Freud and his followers for the understanding of the phenomena of hypnotism and Schilder's own elaborations will here be only hinted at in so far as will be necessary to explain the psychology of hypnotism. In a measure this paper is an attempt at abstracting the contents of the book on Hypnosis by Schilder & Kauders

Even though much of what has been found to be the present explanation of the phenomena of hypnosis may be controverted by later investigations and theories, nevertheless the present understanding of this subject has been decidedly enhanced over the past by this psycho-biological presentation of hypnosis

The influence of hypnotism on the perceptive and conceptive faculties of the mind and its variation on different individuals has been pretty well established Some individuals can be easily hypnotized and will readily accept suggestions of varied character, thus facilitating a rapid re-Others resist being hypnotized, but will at the same time assume an attitude as though they were asleep and when awakened will describe a feeling of drowsiness and fatigue and even show surprise at the lapse of conscious at-The former type of hypnosis requires tention deep sleep and is called profound hypnosis; while the latter is called light or superficial hypnosis In some patients marked motor phenomena, such as extreme laxness of all muscles or on the contrary a stiffening of the whole body, or a catalepsy occurs, although no actual suggestion has been given to this effect. Twitches and tremors or hysterical attacks may manifest themselves and can be recognized as a keen sense of fear patient of mine who suffered from hiccoughing of a very loud and annoying character first broke out into a fearful crying spell before yielding to a hypnotic sleep that stopped her ailment I interpreted this psychoanalytically as showing a resistance towards giving up this act which was a substitute for an expression of some unconscious, ungratified desire. In the deeper forms of hypnosis, patients will exhibit a readiness to carry out a variety of commands or suggestions even for some time after the hypnotic state. This is the so-called post-hypnotic state which forms the basis of the psychotherapeutic method of A great deal of new material has treatment been gathered along these lines pointing to a clearer understanding of the reasons for the acceptance or rejection of suggestion and has to do with

the fundamental character of the individual experimented upon This, of course, points toward a psychic construction of hypnosis, the character of which must correspond to the psychic mechanism of the normal mind In other words, the phenomena of hypnotism can only be interpreted in the light of psychic processes already present in the individual, thus stripping hypnotism of its deep mystery A large number of possibilities of hypnotic reaction and phenomenon can take place, depending upon the character of the total personality of an individual and his susceptibility to the influence of suggestion Accordingly, three different stages of hypnosis have been described First, the mild somnolence, second, the light slumber or superficial hypnosis, and third, deep sleep or somnambulism

Aside from the effect obtained from direct suggestion of the operator upon will and feelings, there are other phenomena which must be considered as having been derived from direct influence upon the vaso-vegetative mechanism injection of adrenalin into the blood stream has been shown to have no effect in raising the blood pressure in hypnotic as well as in normal sleep Heilig and Hoff interpret this as meaning that the system automatically provides the adrenalin reaction for the vegetative mechanism and thus demonstrates the physiological similarity of sleep The variety of muscular rigidities to hypnosis and catalepsies, and the many conditions obtained through suggestion, such as tensions of extended limbs, the tetanic streams of innervation for muscular expression, and the peculiar movements of psychotics, all show the existence of a specific cerebro-physiological apparatus to carry them out to completion, either as a result of normal behavior or from the influence of hypnosis influence on the heart and blood vessels by the emotions, such as acceleration and retardation of the pulse and sometimes even fibrillation and death have been known to occur as a result of emotional disturbances of those suffering from previous heart trouble (Hoff) A patient of mine was asked to observe another patient being treated with a hypodermic injection given in the region of the neck Suddenly she swooned, convulsed, and vomited at the sight of this act This reaction can also be explained in terms of a psychophysiological apparatus which may be visualized as a mechanism subject to the influence of psychic processes Thus hypnotism and its influence on the sleep mechanism and similar phenomena can be made understandable These effects upon the organic mechanisms of the mind may be obtained through the emotions and intellect without concentrating directly on organs, but by suggesting the content of such behavior Suggestion of warmth, of cold, of color changes, or blisters on the skin, have been brought about through the action of the emotions on the vaso-vegetative mechanism of circulatory and trophic activity

Hypnotism applies itself readily to the functions in the level of the more primitive impulses of motility acting also through the vaso-vegetative functions, located in the nuclei of the striopallidal system and subthalmic area, and controlling the lachrymal and salivary secretion, and the glycosuric and perspiratory functions regulation of temperature, bladder, respiration. sexuality, metabolism, and the glands of internal secretion are believed to be localized within this small area of the above region, and are thought to be closely associated in function as well greater number of akinetic position and posture reflexes may be reduced by hypnosis, whereby a great deal of light is thrown on the physiology of motility, making it possible to understand the variety of motor stimulus phenomena in hypnotism, such as convulsive twitchings and hysterical attacks We need only think of removing the inhibitions over these primitive motility tracts and the phenomenon will exhibit itself

The influence upon the sexual organs through psychic means, conscious or suggestive, may result in a variety of reactions. The influence on the organism or menstrual function by suggestive therapy has been reported by Forel and O Heilig and Hoff have experimented Schwartz with hypnotic suggestion of pleasure-pain ideas on the secretion of urine and the retention of sodium chloride They showed that anxiety and shock increased the volume of urine and lowered the amount of sodium chloride These are surely very interesting and instructive revelations recent years there has been an advance of interest in the function of the endocrine glands and their influence upon the total make-up of the body as well as upon the personality The effect of the emotions on the secretion of the adrenals and the thyroid are too well known to be spoken of here Basedow's disease and glycosuria are classical examples of the influence of the emotions upon these conditions The effect of hypnotic influence on these glands has not yet been ascertained Eichelberg succeeded in producing fever, and Grafe was able to demonstrate the influence on the calcium metabolism in hypnotism Bauer and Schilder have succeeded in suggesting vertigo by telling the patient that everything was going around him in the room and were able to demonstrate on awakening the presence of past-pointing similar to that of cerebellar past-pointing phenomenon has been considered as being due to a direct influence on the vestibulo-cerebellar func-Lowy, however, thinks that it is due to the change in the conception of direction It is possible to understand such influence when we recall the power of suggestion for the hallucinatory mechanisms in other conditions

A still clearer view comes to us of the relationship of function to organs when we think of the influence of hypnosis on normal sleep Surely this relationship is undisputed In fact, hypnotic

sleep and normal sleep are so identical that it is hardly possible, from outward appearances, to distinguish them apart. In both states the pupils are often contracted and there is no change in respiration Very new and convincing experiments by Schilder and Kauders and studies by Economo have resulted in the discovery of a sleep center in the vicinity of the third ventricle at the junction of the Aqueduct of Sylvius Economo's investigations of the pathology of epidemic encephalitis showed marked changes in the ganglion cells of this region, and in the region of the infundibulum This localization of the sleep center corresponds entirely with the findings of Kau-In encephalitis ders in his experiments on dogs of the agitated, hyperkinetic types, where it is often impossible to differentiate these symptoms from those of hysteria, I tried the use of hypnotism, believing that if the symptoms subsided, it would determine the diagnosis in favor of hys-My contact with Dr Kauders in Vienna resulted in learning of my error in regarding this as a point of differential diagnosis, for I found that Dr Kauders used hypnosis in this type of encephalitis with good results, to subdue these symptoms

Normal sleep as well as hypnotic sleep is conditioned by this center in the nucleus of the brain as far as the physiological processes of these phenomena are concerned But with the discovery of this brain center for sleep, the explanation of the phenomena of sleep or of hypnotic sleep is not A person wishing to fall asleep must have a psychic wish to do so Even then resistances from either the emotions or neurotic disturbances may prevent its fulfillment and, vice versa, one may fall asleep in spite of not wanting The conclusion from the foregoing is that not one but two kinds of sleep wishes must exist a psychic one and an instinctive one latter is in direct relation to the bodily energies or deep centers upon which the psychic wish plays and operates by way of the vaso-vegetative mech-This interchange in the play of the psychic wish and the sleep mechanism can be well demonstrated by recalling various conditions during sleep, when for instance, the mother wakes only at the cry of her child, or the doctor only at the ring of the telephone There are adjustments of the psychic wish to the special character of a stimulus and there are those in which the time perception of sleep, such as a definite waking time, takes place Even in this wakeability there are variations as to the time of night in which one is either more or less, asleep This again speaks for a psychic organic adjustment and requires the explanation which has been given that there are several sleep egos which guard the sleeping function In hypnosis, too, a time perception mechanism exists which is even more accurate It is well known that through suggestion subjects may perceive time relationships almost to an exactitude This has been explained as being due to the uninterruption of the contents of consciousness and affects which are, so to speak, cut off by the hypnosis from the rest of experience. Further study of the sleep mechanism is afforded in the study of dreams which have been so wonderfully amplified by the epoch-making contributions of Freud This again indicates a further specialization of the sleep mechanism into still another ego, the so-called "dream ego" Hence we have a waking ego, a sleeping ego, and a dream ego

Akin to this mass of variable phenomena of normal sleep is that of hypnotic sleep, whose modus operandi is now more easily understandable because of its similarity to the phenomenon of normal sleep. The same kind of adjustments to the sleeping egos must here take place even though the phenomenon may exhibit itself differently because other and more complex psychic processes are involved. One must bear in mind the authenticated statement that the sleeper is not entirely asleep but that he retains part of his consciousness in some corner of his psyche which makes him aware of his sleeping, dreaming, and It is possible to make contacts with the sleeper if the vigil ego does not easily waken This fact is the basis of the technique of hypnosis To place him in a favorable mood for sleeping and to impress upon him that hypnosis is nothing other than a sleep controlled by the hypnotizer. is the whole secret of the technique of hypnosis Some patients can so concentrate upon this act that they can exclude all other sensory or subjective mentation and accept the suggested ideas without resistance. Even in ordinary sleep an amnesia takes place for this contact. I need only remind you of the experience that sometimes occurs when one speakes to a sleeper and obtains answers from him of which he later has no recollection In hypnosis these same transformations take place and the same psychic influence can be had through suggestion. Even dreams can be influenced in hypnosis Schilder suggested to a subject the hallucination of a tree and then induced a vestibular stimulation The subject subsequently told of dreaming that the tree had been cut down, showing, thereby, a fusion of the psychic and the sensory stimulation into dream condensation

The phenomena of wakefulness in hypnosis becomes more understandable when we know the various graduations of sleep in which consciousness and the ego relationship exhibit themselves in dream states such as somnambulistic behavior or, as in the foreconscious acts, before awakening This interaction of psychic mechanism and sleep enhances then our conception of hypnosis as a suggested form of sleep. It is now possible to understand also the readiness with which some people may be hypnotized and others not, depending entirely upon reactions to the instinctive sleep

wish rather than to the psychic wish ego Just as in normal sleep the wish to sleep is often counteracted by the instinctive wish, as, for instance, in insomnia, so also in hypnosis there may be a refusal to accept the suggestion

The study in susceptibility to hypnotic influence has been made through psycho-analysis and differences are attributed to the variation in content of the subject's unconscious rather than his conscious mind Perfect sleep has been considered to be, in terms of Freudism, complete Narcissism, an affective state in which the individual is, so to speak, at one with himself In other words, his self-love of infantile existence flows in complete harmony with the environmental stimu-Or, putting it still in another way, sleep is a complete withdrawal from the world of reality and represents a hallucinatory state of again living an intra-uterine existence. Likewise the state of hypnosis and suggestibility rests upon such a reversion or return of the unconscious to an infantile erotic level in which an adjustment again takes place to the so-called cedipus or father complex This means that the hypnotizer represents one's early ideas of his father or mother and his or her dominating influence against whom certain resistances and repressions must have existed in childhood and to whom he now again unconsciously subjects himself

A great mass of facts has been accumulated in support of this theory which indicates the erotic root of hypnosis It is easy to observe facial expressions and tensions, characteristic of a submission during hypnosis which denotes sexual excitement Sometimes patients will admit their sensual pleasures from hypnosis and occasionally accusations of rape have been falsely It is therefore always advisable to have a "You have third party present during hypnosis hypnotized me" is a common expression meaning "sexually conquered", and in reality gives the clue to the corresponding wish of the patient Hypnosis between like sexes of course involves homosexual components which are present in the unconscious Persons who have strong tendencies to fall in love and to fixate their feelings upon objects are usually good subjects for hypnosis Hysterical individuals also are easily hypnotized for the reason that their affective strivings have been converted and blocked and seek release Compulsive neurotics whose mechanisms are connected with their Sadistic attitudes toward their love objects are difficult subjects for hypnosis In one of my cases of compulsive barking it was impossible to produce a profound hypnosis in her owing to an inability on her part to adjust herself to an unconscious conflict with her father It may here be said that hypnosis is a neurotic state with inhibited goals which means that early infantile repressions have not been relieved and through the person of the hypnotizer an adjustment takes place In other instances there is a

desire on the part of the hypnotized to subordinate himself to authority. This is shown in the readiness with which good subjects surrender themselves to the hypnotizer. Such adjustment is an unconscious subjection and really exists even before the hypnosis actually takes place. On the other hand, it was well known during the war that officers were harder to hypnotize than privates because of their unwillingness to submit to authority, and for the same obvious reason children and adolescents are better subjects than adults. From all this knowledge we may assume, therefore, that hypnosis is in a large measure a self-subjection and this is of very great importance for the technique of hypnosis.

Freud has pointed out that in this relationship between the hypnotizer and his subject there is revealed the psychology of normal love and of lovers, in that it is a complete subjection of one party to the other and the exclusion of the world of reality One identifies himself in that way with the other's goodness and greatness for the sake of adding to himself these qualities by way of identification. In the same way does the hypnotized hope to obtain some of this power of the hypnotizer in some magical manner through This hoped for magical association with him happening exists in every one of us, especially during despair when we look for the impossible Think of this very same power and to happen authority that children ascribe to their parents, which represents nothing more than the wish for power which the child aspires to and receives through identification with his father

Ferenczi has called this the wish for omnipotence which is a return to the infantile level. We must bear in mind, however, that this surrender and subjection of the erotic character of hypnosis is only partial and does not possess the great passion and emotion that is characteristic of love. It is, as someone has said, subject to recall

The social possibilities of hypnosis from the standpoint of attempting to influence the intellectual faculties of the mind by enchancing the intellectual capacity and increasing mental performances has been made the subject of experimentation by Kauders. He began his work with a simple test upon a subject during hypnosis, having previously tested the subject's ability to accomplish the same feat with normal thinking. His findings in this experiment showed definitely this enhanced capacity to multiply figures at intervals of a week without the subject's being aware in the conscious state of the test demanded of him while under hypnosis

Likewise, in the influence of hypnosis on crime, determining investigations have pointed to the conclusions that only those criminal acts will be performed following hypnosis and suggestion as will coincide with the character of the total personality. This is of sociological interest. One must remeber, moreover, that hypnotic sugges-

tion is in reality an acceptance of thought and action which is contrary to the subject's normal personality. It is not conviction or persuasion. The social significance of all suggestion of this character was studied by Freud and recorded in his masterly book, "Group Psychology and the Analysis of the Ego". He pointed out that the psychology of the mob and that of the individual has a similar mechanism in so far as it corresponds to a subjection of the mob to a leader and of the individual under hypnosis to the suggestor. The possibilities for the future of such investigations must surely be of great importance for social phenomena.

Let us now turn to the question of the uses of hypnosis and suggestion, and we shall learn, first of all, that some of the difference exists in the effect of profound and superficial hypnosis on the various layers of personality It is to be imagined that the approach to the vaso-vegetative mechanism is more readily facilitated through the suggestive rapport of deep sleep rather than through superficial hypnosis Likewise with regard to the influence on defects of memory, socalled amnesia, and on the function of menstruation and secretion which are controlled by the centers lying in the mid-brain, inter-brain, and hind-brain Light or superficial hypnosis, however, also effects the psychic processes but, more so, those of the perceptive and conceptive faculties which may transform and influence the patient's personality Hypnosis must be considered, however, only as an auxiliary device for the treatment of conditions which are under control of the In recent years hypnotism has been psyche. used for experiments to enlarge our knowledge of the causes of amnesia. It has been found that no essential difference in the mechanism of forgetting exists in hypnosis and in lapses of memory due to defects resulting from trauma or from epilepsy Schilder was even able to restore retrograde amnesia in a person resuscitated from hanging, in which condition organic injury of brain tissue had most likely taken place chronic alcholism and in Korsakoff's syndromes, where the power of notation is lost, hypnosis has helped to restore the memory and capacity to relearn Lapses of memory have been re-associated in those cases of loss of identity through hypnosis

Thus the use of hypnosis should be entirely restricted to therapeutic purposes. It is in reality hardly justifiable to use it for experimental or other purposes. In a general way it may be said that there are no dangers connected with its use except perhaps in creating a subordination of the patient to the hypnotizer. This danger is imminent, however, in all forms of psychotherapy. It can also be said in a general way that hypnotism is exceedingly valuable in all forms of neurosis which are not amenable to persuasion and educative means, as in the case of patients who, by reason of either low grade intelligence or

economic disability, cannot be treated by psychoanalysis or by rest cures It is so frequently a short cut out of a situation which often challenges the most capable physicians in knowing what to do for them I have in mind, for instance, the frequent cases of neurotic vomiting of young adults They are always a great problem to handle and resist all forms of treatment and yet sometimes will yield favorably to hypnotic influence and suggestion These cases must be kept under the influence of a prolonged period of hypnotic sleep, aided by the administration of small doses of hypnotic drugs A case of this kind was recently under my care at the hospital which resisted all forms of other treatment during the irregular course of her ailment of three years' duration Stubborn ties that will not be helped by analysis and re-educational methods can usually be cured with the aid of hypnosis

It has been known for a long time, on well founded grounds, that in the treatment of insomnia hypnosis is the best therapeutic method Suggestion for sleep must be given so that it will very much resemble the processes of normal sleep and not by merely commanding the patient to For hysterical conditions, wherever possible, psychoanalysis is the treatment per se in order to uncover the repressed mechanism of the condition If hypnotic suggestion must be used a psychoanalytic insight should be attempted so that the suggestion will correspond to the psychogenesis of the condition This is likewise true for the treatment of the neuroses A woman of 46 had suddenly developed an mability to raise either eyelid and could not see out of an eye which was apparently normal This occurred immediately upon emerging from an anesthetic given for an enucleation of the other eye because of glaucoma. The blindness in the remaining eye had existed for 4 months previous to her coming to me, and she seemed completely resigned to her fate She had even gone to an institution for the blind to learn basket-weaving and knitting Under hypnotic suggestion she recovered the ability to open her eyes and to see perfectly The analysis of the mechanism rerealed the psychology of her hysterical blindness As she was losing consciousness under the influence of the anesthetic, she thought that she would probably be blind after the operation, just as her mother who had died 20 years previously had Further analysis disclosed her wish to be blind as her mother had been because of a sense of guilt that had always pervaded her mind She had felt that the mother's blindness was the result of the shock she experienced when she learned of the daughter's (the patient's) elopement against the mother's wishes Evidently we had here an unconscious wish to be blind before her demise in order to reconcile herself with her mother, whom she expected to meet soon in the great beyond

wish rather than to the psychic wish ego Just as in normal sleep the wish to sleep is often counteracted by the instinctive wish, as, for instance, in insomnia, so also in hypnosis there may be a refusal to accept the suggestion

The study in susceptibility to hypnotic influence has been made through psycho-analysis and differences are attributed to the variation in content of the subject's unconscious rather than his conscious mind Perfect sleep has been considered to be, in terms of Freudism, complete Narcissism, an affective state in which the individual is, so to speak, at one with himself words, his self-love of infantile existence flows in complete harmony with the environmental stimu-Or, putting it still in another way, sleep is a complete withdrawal from the world of reality and represents a hallucinatory state of again living an intra-uterine existence. Likewise the state of hypnosis and suggestibility rests upon such a reversion or return of the unconscious to an infantile erotic level in which an adjustment again takes place to the so-called œdipus or father complex This means that the hypnotizer represents one's early ideas of his father or mother and his or her dominating influence against whom certain resistances and repressions must have existed in childhood and to whom he now again unconsciously subjects himself

A great mass of facts has been accumulated in support of this theory which indicates the erotic root of hypnosis It is easy to observe facial expressions and tensions, characteristic of a submission during hypnosis which denotes sexual excitement Sometimes patients will admit their sensual pleasures from hypnosis and occasionally accusations of rape have been falsely made It is therefore always advisable to have a third party present during hypnosis "You have hypnotized me" is a common expression meaning "sexually conquered", and in reality gives the clue to the corresponding wish of the patient Hypnosis between like sexes of course involves homosexual components which are present in the Persons who have strong tendenunconscious cies to fall in love and to fixate their feelings upon objects are usually good subjects for hypnosis Hysterical individuals also are easily hypnotized for the reason that their affective strivings have been converted and blocked and seek release Compulsive neurotics whose mechanisms are connected with their Sadistic attitudes toward their love objects are difficult subjects for hypnosis In one of my cases of compulsive barking it was impossible to produce a profound hypnosis in her owing to an inability on her part to adjust herself to an unconscious conflict with her father It may here be said that hypnosis is a neurotic state with inhibited goals which means that early infantile repressions have not been relieved and through the person of the hypnotizer an adjustment takes place In other instances there is a

desire on the part of the hypnotized to subordi-This is shown in the nate himself to authority readiness with which good subjects surrender themselves to the hypnotizer Such adjustment is an unconscious subjection and really exists even before the hypnosis actually takes place. On the other hand, it was well known during the war that officers were harder to hypnotize than privates because of their unwillingness to submit to authority, and for the same obvious reason children and adolescents are better subjects than adults From all this knowledge we may assume, therefore, that hypnosis is in a large measure a self-subjection and this is of very great importance for the technique of hypnosis

Freud has pointed out that in this relationship between the hypnotizer and his subject there is revealed the psychology of normal love and of lovers, in that it is a complete subjection of one party to the other and the exclusion of the world of reality One identifies himself in that way with the other's goodness and greatness for the sake of adding to himself these qualities by way In the same way does the of identification hypnotized hope to obtain some of this power of the hypnotizer in some magical manner through association with him This hoped for magical happening exists in every one of us, especially during despair when we look for the impossible to happen Think of this very same power and authority that children ascribe to their parents, which represents nothing more than the wish for power which the child aspires to and receives through identification with his father

Ferenczi has called this the wish for omnipotence which is a return to the infantile level. We must bear in mind, however, that this surrender and subjection of the erotic character of hypnosis is only partial and does not possess the great passion and emotion that is characteristic of love. It is, as someone has said, subject to recall

The social possibilities of hypnosis from the standpoint of attempting to influence the intellectual faculties of the mind by enchancing the intellectual capacity and increasing mental performances has been made the subject of experimentation by Kauders. He began his work with a simple test upon a subject during hypnosis, having previously tested the subject's ability to accomplish the same feat with normal thinking. His findings in this experiment showed definitely this enhanced capacity to multiply figures at intervals of a week without the subject's being aware in the conscious state of the test demanded of him while under hypnosis.

Likewise, in the influence of hypnosis on crime, determining investigations have pointed to the conclusions that only those criminal acts will be performed following hypnosis and suggestion as will coincide with the character of the total personality. This is of sociological interest. One must remeber, moreover, that hypnotic sugges-

hours after a meal A fasting blood sugar gives a normal reading and the question arises whether we are justified in dismissing the patient with the diagnosis of a transient and harmless glycosuria

The inclusion of alimentary glycosuria within the group of diabetics has cleared the field a good deal for the diagnosis of this disease Difficulty is encountered in those patients who show an intermittent glycosuria, and where the urine passed 6-7 hours after the last meal or even 3-4 hours after a sparing meal, shows no sugar A twenty-four hours specimen of such patients in case the amount of urine passed is 2500-3000 cc, may not give much of a reduction if 2-3 gms sugar have been passed in small portions soon after the meals, while no sugar was passed during the rest of the 24 hours The fasting blood sugar in these cases as mentioned above, will frequently give a normal value

In 1913, Jacobson published a series of cases showing the influence of carbohydrate and glucose feeding on the blood sugar. At about the same time functional tests for kidney and liver disturbances have been perfected so that pathological changes in these organs could be elicited long before the routine clinical history would demonstrate a diseased condition of the organs in question. Profiting by these experi-

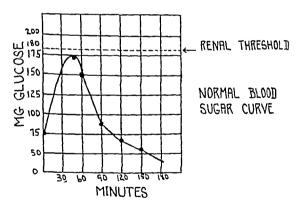

FIGURE I

ences some men began applying this principle to testing the ability of the organism to store and metabolize glucose after its oral administration. It was assumed that a mild diabetic who gives a normal blood sugar value on a fasting stomach, would show a different blood sugar curve after a rapid absorption of glucose into the portal system, than would a normal individual. In practice this has proved itself to be a fact and thus became of considerable value in the diagnosis of diabetes. The method employed by some of feeding the patient carbohydrates and glucose for a certain length of time in order to observe its effect on the urine

and blood, is not without its dangers. If the case is a mild diabetic with a high tolerance, such overfeeding may do definite harm by lowering the tolerance

The effect of ingested glucose on the circulating blood may be plotted as a curve showing a, an ascent, b, a peak or plateau, c, a descent having more or less the same angle of inclination as the ascent.

If a patient is given 100 gms of glucose on an empty stomach, the blood sugar content begins to rise five minutes after the ingestion and rises rapidly so that in a half to one hour the maximum is reached. This maximum does not exceed 180 mg per 100 cc blood in a normal person, and if this level is reached small traces of sugar may appear in the urine. From this point the fall sets in, and by the end of the second hour the blood sugar has reached its original level or more frequently a somewhat lower level.

In diabetics the glucose blood sugar curve varies from that of the normal in the following respects

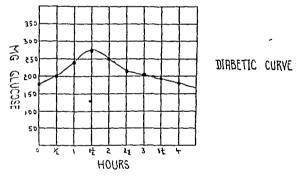

FIGURE II

- (a) The fasting blood sugar before the administration of glucose is above 120 mg or may be normal in mild or beginning diabetes
- (b) The ascent of the curve is prolonged and fails to reach the peak within one hour, but instead is extended to the second or third hour
- (c) The acme of the curve is far above the normal usually going up to 200-300, and in some extreme cases to 500-600 mg
- (d) The decline of the curve is prolonged beyond the end of the second hour, and may not reach the initial figure for 6-7 hours. The reason why a well developed diabetic always excretes sugar in the urine is due to the fact that the blood sugar never drops below the renal threshold of the particular patient between meals. When the next meal is taken the blood sugar curve has not recovered as yet the fasting level, and of course rises again with the new meal.

In organic diseases such as cardiac diseases multiple sclerosis, and tabes, where anxiety over their condition exists and the patients are only too ready to relinquish the fight against the disease or symptom, proper suggestion of a mild

hypnotic nature may be of use

The use of hypnosis to relieve and prevent pain is a subject of great interest and has been largely the basis of the mystery of hypnosis Many apparently painless operations were performed under its influence and have had many advocates for its use, though in this day of anesthetic surgery it would hardly be wise to use hypnosis instead For the treatment of various addictions, such as morphinism and alcholism, hypnosis is said to be very effective in their cure, though very highly technical specialization is required. A few words must be said of the treatment of sexual perversions with hypnosis Most authorities who have used it claim no great results for it and the same is true for all influence in which the character qualities of the individual are in question Only in so far as the patient's contact with the personality and authority of the doctor may count, this influence may help to change his habits and character In the light of what we have learned from the psychoanalysis of sleep, it is important to bear in mind for therapeutic purposes in general that through hypnosis and suggestion we are attempting to rebuild and reform the individual at the time when he is, so to speak, a formless being, because the hypnotic state means, in psychological terms, returning to the primitive state, and he is therefore made susceptible to reconstruction at the hands of the physician's personality

The numerous instances of rapid cures with mild hypnosis in conditions of compulsive and

anxiety neuroses and the temporary habit formations such as facial gesticulations, transient emotional disturbances, in all of which analysis cannot be resorted to because of the time element or the intellectual factor, makes the hypnotic method of treatment most invaluable. It is the belief of the writer of this paper that a wider knowledge and a more general use of hypnosis would rehabilitate this indispensable agency in psychotherapeusis.

In summarizing the conclusions with respect to the use of hypnotism in medicine, I have called attention, first of all, to the situation which exists in this country, especially to its discard as a remedial measure and a revival of its use in other countries Further, the theoretical significance of this phenomena for the newer study of psychical processes involved in the complex of neuro-biological function, has exhibited a renewed Thirdly, the function of sleep has been shown to be definitely localized in the wall of the third ventricle at the junction of the Aqueduct of Sylvius, a discovery that has thrown much light upon the lethargic symptoms of encephalitis Fourthly, by the application of the Freudian theories, the psychology of hypnosis, sleep, and its concomitants have gained a clearer vision for the understanding of this complex phenomena Fifthly, the relationship of the hypnotic influence to the vaso-vegetative centers of the inter-brain, mid-brain, and hind-brain, points to the importance of this knowledge for an enhanced understanding of the mechanism of hypnosis as a therapeut c agent Lastly, its various uses in medicine constitute an auxiliary method in the treatment of certain symptoms and ailments which makes it invaluable for its rapidity and effective-

ON THE VALUE OF THE FUNCTIONAL TEST IN THE DIAGNOSIS OF DIABETES*

By JULIUS FERBER, M D, ISAAC APPERMAN, M D, and SOPHIE RABINOW NEW YORK, N Y

THE modern methods of treating diabetes particularly the fast days popularized by Allen and his followers, have shown that even severe diabetics can have their blood sugar brought down to normal. In view of this fact it is not surprising to find that cases of beginning or mild diabetes should have a normal fasting blood sugar

We know now, that the so-called alimentary glycosuria is in fact the beginning of a diabetic condition. At first sugar appears in the urine only with the sharp rise in blood sugar above the renal threshold, which takes place after a meal, but in the fasting period 12-14 hours

* From the metabolism clinic University and Bellevue Hospital Medical College

after the meal the carbohydrate metabolism has readjusted itself with a sharp drop below the renal threshold and the urine tested at this time will not show any sugar. It is our thesis that a normal fasting blood sugar does not exclude the existence of a diabetic potentiality In the cases to be reported we attempt to show that a defect in carbohydrate storage mechanism can be demonstrated in patients who show a normal fasting blood sugar This is of practical importance in cases who do not show the well-known signs and symptoms of diabetes, but were told that their urine contained sugar Such patients usually restrict their diet immediately, and when they come for a diagnosis the urine may be sugar free even if passed 3-4

was definitely icteric, temp 1012 F, and there was tenderness in the epigastrium. Urine was free of sugar, but contained 4 plus acetone. The diet was reduced but the child was losing weight and there was sugar and acetone in the urine so that insulin had to be restored to again before the urine became negative.

Case II — H S, male 17 years One brother age 7, and one sister age 3 have diabetes and

are receiving insulin

Childhood diseases, Measles and diphtheria Previous history Chronic osteomyelitis for the last 10 years

Physical examination Osteomyelitis of right arm and leg, large diseased tonsils, otherwise negative Casual urine was negative, and so was the urine after a twenty cracker test

Blood sugar curve

Patient has developed subsequently an attack of acute articular rheumatism, and as a result sugar and ketone bodies appeared in the urine. At present the patient is an outspoken diabetic and must be given insulin for the control of his condition

Case III—R K, female 43 years, family history of no importance, does not remember ever being sick with the exception of two miscarriages, one at four months, and one at six weeks. Before admission to our clinic patient went to her family physician complaining of pain in the muscles and joints, vulvar itching, thirst, polyuria, and loss of weight. At that time sugar was found in the urine, but subsequently repeated examinations were negative and patient came to us for a diagnosis.

On admission a casual urine showed no sugar, 20 cracker test was negative, and the

Wassermann was negative

Blood sugar curve

FASTING 1 HOUR 2 HOURS
Blood 90 mg 150 mg 200 mg
Urine 0 12% (90c c) 2.2% (75c c.)

Patient was put on a diet and she kept sugar free until she relaxed and indulged her desires in starchy food and fruits when her urine showed 2 per cent sugar

Case IV —M S, female 50 years old, family

history of no importance

Previous history Womb operation 6 years ago, mastoidectomy 9 months ago, and an attack of what patient calls kidney trouble 6 months ago

Present history Duration eleven months and chief complaints were loss of weight (32 lbs), swelling of feet, and pyrosis

Physical examination showed an under-

nourished, pale individual, a loud diffuse systolic murmur, no evident enlargement of the heart, pulse rate 60, blood pressure 130/65, lungs negative but some tenderness over the gall bladder region. When patient came to us a casual urine was sugar free, the twenty cracker test was negative, and the fasting blood sugar was 100 mg.

Blood sugar curve

FASTING 1 HOUR 2 HOURS
Blood 128 mg 200 mg 160 mg
Urine 0 Faint trace 08% (85c.c)

Case V—S C, female 38 years old, has never been sick before

Present history began one and a half years ago when patient began complaining of sacral backache, pain in the left groin, and loss of weight

Physical examination was negative Casual urine was sugar free, twenty cracker test was negative, and the blood sugar was 120 mg

Blood sugar curve

	Fasting	1 Hour	2 Hours
Blood	116 mg	240 mg	192 mg
Urıne	0	0	0

Case VI —J A, male 68 years old, with negative family history, and no previous illness

Present history began one year ago when patient began complaining of thirst, polyuria, and general pruritis. Patient went to Bellevue O. P. D. where sugar was found in the urine

Physical examination was negative except for a skin condition (scabies) Urine was negaitve, and the twenty cracker test was negative Blood sugar curve

Case VII —P H, male 78 years old Previous history Had gonorrhea twice, otherwise negative

Present history Five months ago developed an acute bronchitis, the urine was examined and was found to contain sugar

Physical examination disclosed an obese individual of waxy appearance with edema of the eye lids. Heart and aorta were enlarged, mitral systolic was audible, and there were occasional extra-systoles. Blood pressure was 140/80. There were evidences of hypertrophic arthritis of the fingers. Casual urine was sugar free, but the twenty cracker test showed 0.2 per cent sugar in the urine. A fasting blood sugar had 125 mg sugar per 100 c c blood.

Occasionally one finds a peculiar blood sugar curve which has the following characteristics

There is a sudden rise in the blood sugar which goes above 180 mg within a short period of time. The maximum of 200 or more may be reached at the end of half an hour. If this maximum goes above the renal threshold, sugar appears in the urine. From its highest

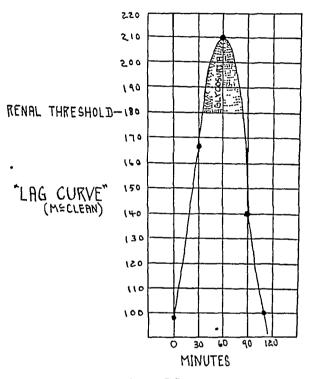

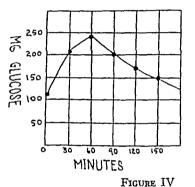

FIGURE III

point the blood sugar drops just as suddenly, and at the end of one and a half hours reaches the original level McLean has first described this curve and designated it as "lag curve" According to McLean this curve does not indicate diabetes because patients presenting this curve do not develop diabetes when observed for a number of years Of the same opinion is Calvert who observed seven such He also claims that patients for two years individuals showing this curve are usually According to other indecidedly neurotic vestigators, however, people giving a "lag curve" may become outspoken diabetics

McLean gives the following explanation of this curve, normally the absorption of glucose into the portal system calls forth the regulatory mechanism which prevents the blood sugar from rising above the renal threshold, but in these cases this mechanism is delayed and tardy in its action. Once this regulating mechanism begins functioning it works in a normal manner

METHOD OF PROCEDURE

In all the cases to be reported the fasting blood sugar was determined in the morning 12-14 hours after the last meal Then 100 gms of glucose in the form of karo-syrup was given dissolved in 8 ounces of water We are aware of the fact that many investigators use only 50 gms glucose for the tolerance curve, but as our patients unsually had a high glucose tolcrance as determined previously by the twenty cracker test, we felt that in order to tax the glucose tolerance for the purpose of a functional test, 100 gms glucose would be ad-The Folin method of blood sugar determination was used in all cases patients were made to void before the glucose was given and subsequently before each blood withdrawal so that glycosuria as well as hyperglycemia curves were obtained

GRAVES DISEASE

REPORT OF CASES

Case I — C A, 8 years, male, normal birth at full term. No history of diabetes in the family Childhood diseases. Measles and bronchitis.

March, 1926, child began complaining of a tired feeling, thirst, polyuria, and a loss of weight of seven pounds. Child was admitted to Bellevue hospital where he was treated for five weeks with diet and insulin, and then he was discharged sugar free. Patient was taken to a private physician who claimed that the child does not suffer from diabetes.

June, 1926, patient came to our clinic Wt. 501/4 lbs, Ht 441/4 in, urine neg, blood sugar 0.08 per cent. On a twenty cracker test the child showed no sugar in the urine

Blood sugar curve.

	FASTING	1 Hour	2 Hours
Blood	80 mg	220 mg	185 mg
Urine	0	1% (65c c)	2.2% (75c c)

Patient was put on a diet C 135, P 45, F 120 and on this diet the urine remained sugar free while the child gained one and a half pounds On October, 11-26, the patient came to us complaining of diarrhea and great debility Skin

being excluded What then, one may ask is the value of the functional test in the diagnosis of Before one ventures an answer to this question, the following considerations must be kept clearly in mind

The absence of diabetic symptoms do not argue against a diabetic potentiality. One would not expect any of the symptoms characteristic of diabetes so long as the carbohydrate metabolism can vindicate itself even under some handicap, and the minimum requirements of the body are met Only under special conditions such as shock or infection, when the organism is taxed to its limit would such a potentiality change into evident diabetes This is the more reason why these patients should be protected as well as we know how, in order to spare their tolerance for emergencies that may arise in the future

A defective carbohydrate metabolism as demonstrated by the glucose blood sugar curve may be brought about in one of two ways 1, the defect may be the direct result of a hypofunction of the islands of Langerhans regardless of its cause, or 2, it may be due to a hyperfunction of the secretion of the ductless glands which are known to be antagonistic to the islands of Langer-The experimental evidence for this last assumption is furnished by the well known facts that thyroidectomy in animal leads to a diminished concentration of the blood sugar, and reduces the hyperglycemia which follows carbohydrate In partially departreatized animals suffering from hyperglycemia and glycosuria, the ablation of the thyroid diminishes the glycosuria It is also known that thyroid feeding in animals leads to glycosuria Clinically the incidence of glycosuria in exophthalmic goitre, is put by some authorities as high as 60% The fasting blood sugar is normal, but after the ingestion of glucose the curve is abnormal and in all respects looks like a curve of a mild or beginning diabetes Similar antagonistic action has been shown in regard to the adrenals, and the pituitary of acromegaly give a high fasting blood sugar, and the curve may look exactly like the curve of a well established diabetic, although as a rule

the curve falls more rapidly than in diabetic

These are the limitations of the functional test. and taken by itself the functional test will not always establish a diagnosis The test informs us as to the condition of the carbohydrate storage and assimilation which is a complicated mechanism, and therefore can be disturbed in more than Once a defect has been demonstrated, the patient and the clinical history must be carefully studied

Summary

Cases have been presented to show that a defect in the carbohydrate metabolism can be demonstrated in patients who show no sugar in the urine, and have a normal fasting blood Three of the patients reported have subsequently been shown to be definitely diabetic and therefore prove the value of the functional The limitations of this test have been discussed It is obvious that all cases showing a defective carbohydrate metabolism should have prophylactic treatment so as to be safeguarded against future emergencies

TABLE-I- SUMMARY OF CASES

DISCUSSION

The twenty cracker test that we employ in the clinic is carried out in the following manner The patient is instructed to have a light supper not containing more than 50 gms carbo-

hydrates, 20 gms protein, and 35 gms, fat The next morning the patient gets up at 7 A M and voids urine which is discarded. From this time on all urine passed for 24 hours including 7 A M next morning, is collected, measured, and a specimen brought to the clinic In the course of the twenty-four hours the patient is not to eat or drink anything except as follows: 20 crackers divided in three meals, 7 crackers 8 A M, 7 crackers 12 M, and 6 crackers 5 P M No food is to be taken after 5 P M. The patient may drink during the day, water, tea or coffee without sugar, milk, or cream, and clear broth. The crackers we use are the "Uneeda Biscuits" which according to Joslin contain (4 crackers) C 20, P 3, F 2 This is a simple device for testing the effect on the sugar output of the It serves several purposes First it shows whether the patient has a glycosuria following the ingestion of carbohydrates, which is the first important step in the diagnosis of diabetes. It may be definitely stated that a normal individual will not show any sugar in the urine in the course of twenty-four hours, during which time no food is taken except twenty crackers, as these contain only C 100, P 15, F 10 Glycosuria ē Amylo 1 e, glycosuria even after a rich starchy meal, is considered by all authorities for practical pur-Secondly, it helps us poses, a case of diabetes determine the carbohydrate tolerance of the patient at the time, and thus guide us in the makeup of the diet Finally it gives us a basis for comparing the effect of our treatment on the carbohydrate tolerance in the course of time, by giving another twenty cracker test

In studying the blood sugar curves of the cases reported, it becomes evident that the peak of the glycosuria curve does not coincide with As a matter that of the blood sugar in all cases of fact the reverse seems to be the case in most of the cases, i e, the percentage of sugar in the urine would appear to rise while that of the The reason for this is the blood is declining fact that the urine collected the first hour after the ingestion of glucose represents the urine secreted into the bladder from the time the blood sugar began to rise from its normal level to its peak, and therefore contains urine secreted before the renal threshold was exceeded which is sugar free The threshold may not be reached until shortly before the first hour, so that sugar is excreted only for a short while During the second hour however, the blood sugar level is mostly or entirely above the threshold, and sugar is being constantly excreted

The first three cases reported have a special interest due to the fact that the patients proved subsequently to be definitely diabetic. The others are still under observation, and all of them are sugar free, keep their weight, and maintain their strength, on a full carbohydrate diet, only sugar

THE NEW ENGLAND JOURNAL OF MEDICINE

The journals of the state medical societies are undergoing an evolution of which the most recent evidence is the change in name of the Boston Medical and Surgical Journal to the New England Journal of Medicine This change went into effect on February 23d after the Journal had been published an even century An announcement of the proposed change was made in an editorial in this Journal of August 15, 1927, which discussed the broader plans of the Journal and expressed the expectation that the Journal would become the official organ of all the New England states, through a formal conference of the representatives of the six state societies New Hampshire and Vermont have already joined with Massa-chusetts in the publication of the Journal Maine and Rhode Island each has its own Journal, and Connecticut is the only state not represented on a state medical journal

The first issue of the Journal under its new name appeared on February 23, 1928, and preserves all the features which have made the older Journal well known throughout the country. The first part of its scientific section is given over to a history of the Journal from its beginning—a story which illustrates the sturdy character and persistence of the typical New Englander. The article is illustrated with reproductions of the title pages of the Journal at various times, and the story is told largely by means of quotations from the Journal

An age of exactly a century has been ascribed to the Boston Medical and Surgical Journal, but strictly speaking it was 116 years old on January 1, 1928. It was born of the union of two parents—the New England Journal of Medicine and Surgery and the Medical Intelligencer. The Journal in 1923 said. "It represents a worthy survival of the fittest from the best of medical journals in New England. It derives its form from the Medical Intelligencer, its substance from the New England Journal of Medicine and Surgery, its spirit from both."

The New England Journal of Medicine and Surgery was first published on January 1, 1812. The leader in its founding was Dr. John Collins Warren, who was Professor of Anatomy at the Massachusetts Medical College, which became the Medical School of Harvard University. With him were associated seven other physicians, and the eight formed a club which met each month and discussed the contents of the Journal. Much of the success of the Journal is due to the firm foundation which was laid by its first editors and to the standards which they then adopted. The Journal has not missed an issue since its first establishment.

The Medical Intelligencer was established as a medical weekly journal on January 1, 1823, and was published regularly and successfully for five

years, at the end of which time it was bought by the editors of the New England Journal of Medicine and Surgery and the two were united under the name of the Boston Medical and Surgical Journal The first issue of the new journal appeared on February 19, 1828, and now a century later it has reverted to the original name of one of its parents, with the omission, however, of the word "Surgery" at the end

Among the title pages which were reproduced in the first issue of the new Journal, there is one which appeared on February 13, 1833. An elaborate cut at the top shows Hippocrates in the Temple of Æsculapius transcribing votive tablets which correspond to the clinical records of a modern hospital. A page of explanation of the cut ends with an invitation to "the medical reader to hang up his tablets in this our temple, that the result of his experience, like that of the men of ancient days, may be the means of enlightening the minds and relieving the sufferings of others"

Another first page which is reproduced is that of Wednesday, November 18, 1846, in which a severely plain heading is followed by an article entitled "Insensibility During Surgical Operations Produced by Inhalations," by "Henry Jacob Bigelow, M D, one of the Surgeons of the Massachusetts General Hospital" A note states that the paper had been read before the Boston Society of Medical Improvement, November 9th, 1846, an abstract having been previously read before the American Academy of Arts and Sciences, November 3rd, 1846

The article begins "It has long been an important problem in medical science to devise some method of mitigating the pain of surgical operations. An efficient agent for this purpose has at length been discovered. A patient has been rendered completely insensible during an amputation of the thigh, regaining consciousness after a short interval. Other severe operations have been performed without the knowledge of the patients. So remarkable an occurrence will, it is believed, render the following details relating to the history and character of the process, not uninteresting."

Then follows a description of the extraction of teeth by Dr Morton on October 16, 1846, and on the following day the removal of a fatty tumor from the arm of a woman by Dr Hayward Curiously enough the name of the substance which was inhaled is not given on the first page of the Journal

The Journal was published as a private venture under various auspices until July, 1914, when it became the official organ of the Massachusetts Medical Society On April 15, 1921, the ownership and control of the Journal was finally transferred to the Medical Society of the State of Massachusetts

THE EVENING SESSIONS OF THE ANNUAL MEETING

Special attention is directed to the program of the evening sessions of the annual meeting printed on page 400 The old standard features of a banquet and the annual meeting of the Society will be combined on Tuesday evening, while a new feature—that of a joint meeting of all the sections-will be held on Wednesday evening to

consider those phases of medical practice which are common to all physicians The meeting on Wednesday evening will be unique in the history of the Medical Society of the State of New York and should enlist the interest of every member of the Society,-surgeon, internist, specialist, and public health worker

MEDICAL PROGRESS

The Cure of Gastric and Duodenal Ulcer by Intensive Alkaline Treatment.—Hugh Mac-Lean, Isaac Jones, and Geoffrey Fildes, writing in the Lancet, January 7, 1928, cexiv, 5445, describe an intensive alkaline treatment designed to control the hyperacidity which is always present in gastric and duodenal ulcer They recommend a powder composed of 1 part of sodium bicarbonate and 2 parts each of powdered magnesium carbonate and bismuth ovycarbonate The proportionate amounts of magnesia and bismuth may be adjusted to suit the bowels of the individual patient. If for hospital use the large amount of bismuth is found to be too expensive the following formula may be substituted Bismuth oxycarbonate 1 part, sodium bicarbonate, magnesium carbonate, and creta preparata, of each, 3 parts During the first week the patient is kept on 3 pints of milk daily, taken in 8 ounce portions, to each of which 10 grains of sodium citrate has been added A teaspoonful of the powder is taken every two hours after the milk Since it is essential that the gastric secretion be kept alkaline at all times, a double dose of the powder is taken immediately before retiring, and the patient is instructed to take an extra powder if he awakens during the night During the second week, if there are no symptoms, the powder is reduced to four or five doses a The quantity of milk is also reduced, and two or three eggs are beaten in the milk. A certain amount of toast, butter, custard, and cream is also allowed During the third week the powder is further reduced to three or four doses a day, with always a dose at bedtime During the fourth, fifth and sixth weeks, the powder is taken three times a day and at bedtime, and a little pounded chicken may be added to the diet Cooked fruit and vegetables may be added gradually Salads, meat extracts, pastry, nuts, and any food that could leave a large residue in the stomach, should A tendency to secrete excessive be avoided acid can to some extent be controlled by giving olive oil or cream between meals, on an empty stomach In the authors' hands belladonna has proved to be the most useful drug By the intelligent use of this method practically all uncomplicated ulcers can be cured in a comparatively short time with little or no discomfort or inconvenience to the patient The results have been confirmed by x-ray examinations

Pancreatic Lithiasis - Stanley J Seeger reports in Radiology for February, 1928, x, 2, a case of pancreatic lithiasis and reviews the 26 cases recorded in the literature in which pancreatic calculi were removed at operation only two of these cases was the diagnosis made before operation The operative mortality was 7 per cent The most important symptom was pain, variable in character, usually epigastric, dull and continued or intermittent and similar to that of gall-stones Radiation to the lumbar region, especially to the left, is said to be characteristic Opie has shown that obstruction of the pancreatic duct is accompanied by atrophy of the pancreas, but the islands of Langerhans remain intact even when the acini disappear completely, and as a result glycosuria does not develop unless an interstitial pancreatitis is superimposed. Jaundice is not uncommon The interpretation of shadows in the upper abdomen is often difficult when the abdomen is opened the location and consistency of the pancreas make palpation of uncertain value It is thus seen that the condition may be easily overlooked. In Seeger's case there was a history of stomach trouble of seven years' duration, characterized by belching, pyrosis, nausea, occasional vomiting, burning, and pain (not severe) in the epigastrium, radiating to the right scapular region pain seemed to bear no relation to food, except that meats aggravated it somewhat no time was sugar found in the urine roentgenological examination was negative. A previous operation, the nature of which was unknown, had afforded no relief There was tenderness on pressure between the umbilicus and sternum and marked tenderness over the gall-bladder The preoperative diagnosis was cholecystitis without stone At operation the gall-bladder was found to be normal. ploration revealed a mass back of the lesser curvature of the stomach, which, on opening through the gastrohepatic omentum, was found to be in the pancreas Incision revealed a stone, measuring 16 by 07 by 05 cm, which was removed The patient has since remained entirely free from symptoms

Coincidence of Appendicitis and Gall-Bladder Disease—C P Caplesco of Bucharest reports eight cases of this disease association. In all of the patients the appendicitis was latent and overlooked in the diagnosis. The author has specialized on the association and has written papers to show that latent appendicitis may be re-

The original New England Journal of Medicine and Surgery was the sixth medical journal to be established in the United States

The Medical Repository appeared in New York in 1797, but went out of existence in twenty

years

The Medical Museum was founded in Philadelphia in 1804 but was discontinued from 1813 to 1820 and then revived In 1827 it was changed to the American Journal of Medical Sciences which still is in existence

The Medical and Physical Journal was founded in Philadelphia in 1806, but soon went out of ex-

istence.

The Medical and Philosophical Register was

founded in New York in 1810 and the Ecleche Repository in Philadelphia in 1811

The New England Journal alone has survived and has had an uninterrupted existence. If one did not notice the name of the Journal on its title page, he would scarcely be aware of the recent change in the form and policy of the Journal. The new Journal continues one of the most valuable features of any Journal, that of the case records of the Massachusetts General Hospital Anyone wishing to study clinical medicine should read these reports, for they are models of clearness and practicality. The new Journal continues Dr. Walter P. Bowers as Managing Editor and will appear weekly as usual

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Colds

This JOURNAL of April, 1903, contains two articles on "colds" which reflect what would now be regarded as popular, rather than medical opinions regarding them Dr A Alex-

ander Smith says

"I do not know exactly what is meant by the familiar term 'a cold' It would be necessary for me, in order to keep within my limit of time, to put also a limit upon what I feel will be the limited application of the term 'cold' One can hardly accept the interpretation of the laity, who are inclined to attribute everything to 'a cold' I, therefore, restrict my remarks on the treatment of cold to that which is ordinarily recognized by the symptoms which accompany a stuffing up of the mucous membrane of the nose and the adjacent mucous membrane of the throat, and shall not go below the upper air passages"

Dr Smith inclines to the modern view of the

contagiousness of colds, for he says

"I am a believer in the view that many socalled colds in the head are communicable. I need not advance any arguments to prove this, clinical observation would seem to emphasize the fact. Consequently, isolation may be a prevention. I do not believe that all cases of cold in the head are due to an infectious organism, the results of whose cativity can be communicated."

Dr Smith is also on the right track regarding the accessory causes of colds, for he says

"Among those who are prone to the so-called contraction of colds, I am sure both adults and children are protected against them by the pretty constant use of cod liver oil. I

refer particularly, of course, to those who have a low power of resistance. I have found, also, that in those who are subject to disturbance of digestion, particularly if this depends upon some diathesis, such as lithemia, for example, the timely treatment of such diathesis will often prevent what seems to be a marked susceptibility to the development of colds. I am quite confident that in many instances fatigue and anxiety diminish the resistance, or, at least, increase the susceptibility to colds."

Dr W Freudenthal of New York said

"That he had listened with great interest to the papers just presented, but had been disappointed because he had come to learn what cold really is, and this question had not been answered Was it due to the influence of cold upon the system or was it an infection? Dr Walsh had taken the stand that all colds were infections This was not in accordance with his own experience Formerly everything was called a cold, now the tendency was to call everything an infection There was no doubt that infections of the air tract were quite frequently observed, but the common cold was nothing else than the effect of a lower temperature upon the human system were not so, he would ask how it was that, of a large number of persons attending a place of amusement, one would get rheumatism, another bronchitis, and another a cold in the Were there different bacteria here to give rise to these different effects? It was nothing more than the effect of the cold air upon the point of least resistance"

Research workers have not yet in this year 1928 answered Dr Freudenthal's question, "What

is a common cold?"

Liver Extract Treatment of Pernicious Anemia—R Seyderhelm and G Opitz discuss the subject of substituting a liver extract for the dietetic use of liver substance, which is necessary for some individuals who turn against a steady dict of the latter Minot and Murphy who originated the treatment have of course tested various fractions of liver extract in their search for the nature of the active medicinal principle step in the right direction and the authors have profited by the isolation of the water-soluble fraction which is believed to contain the said prin-This contains neither lecithin nor lipoids and only traces of albumin and sulphur In place of ingesting 400 to 500 gms of liver substance it is necessary to ingest only 7.5 gms of dry extract or 80 cc watery extract every 24 hours therapeutic results agree fully with those obtained from liver substance and by the eighth day the blood picture shows evidences of regenera-Almost invariably the red cells increase The urme no longer along with the leucocytes contains urobilin, urobilinogen, and indican In certain cases studied especially, the coli bacilli disappeared from the stomach contents (recently the presence of this organism in the gastric juice has obtained great diagnostic significance in per-This find which is also present nicious anemia) in cancer of the stomach is due largely to low acidity or anacidity and the disappearance of the B cols from the stomach contents was associated in one case with the reappearance of the normal acid content of the gastric juice However, this fact can hardly be raised to a generalization The fact that the new extract is also of value in secondary anemias is of great significance although not true for all types, apparently the forms which yield to iron and arsenic are most likely to be benefited -Klimsche Wochenschrift, January 29,

Biological Importance of Fibrin as a Protective and Curative Substance -S Bergel is astounded at the indifference of the profession to this great subject. Fibrin was once looked on as something disturbing in the economy of Nature and in general a mere symptom was at that period regarded as the disease itself While it may be true that fibrin is one of the products of disease, at times a symptom of disease, there is no reason to infer that its significance is not conser-The number of conservative processes in which fibrin formation plays a role is large, comprising wound healing by first and second intention, hemostasis, callus formation, leucocytosis, antibody formation, immunization, adhesion formation, etc., etc. The question comes up, to what extent may fibrin be employed artificially in medicine? This substance is naturally stable, sterile, and ready for use in its pure state without The whitish-yellow powder whenever tested will be found to be germ free, and it may

1928

be used dry or in solution for injection purposes best in ampoules Its use in hemorrhages is well known, where it hastens coagulation and throm-It may be used in wound healing of all kinds and is a good dressing for burns, ulcers, and granulating surfaces in general. In defective callus formation and pseudoarthrosis it may be injected with benefit, for fibrin is the natural stimulant of callus formation There are contraindications to its use such as acute inflammation and strongly suppurating surfaces In delayed callus formation it is contraindicated if there are soft parts between the fragments of bone or if The action of fibrin ilsuppuration is present lustrates an old maxim of Pflüger's that "injury is the cause of the removal of injury" Fibrin, although the result of a pathological process, is also a cause of recovery from the same-Deutsche medizinische Wochenschrift, February 3, 1928

An Antitoxin for Puerperal Septic Infections—Eugene Gaessler contributes a further report on this subject the first having been made about a year ago by his chief, Professor K Wahrnekros, of the Gynecological Clinic of Dresden The older attempts at preparing a streptococcus serum, which mostly failed, have now been reinforced through the technique of Dick, Dochez, and others in the preparation of a streptococcus antitoxin for scarlet fever. The total number of patients of all kinds with puerperal infection who have been submitted to the new antitoxin has now reached 400, of which 59 had to do with abortions An attempt to group cases by severity of infection yields three types, of which one, C, is very small, comprising only three who reached the clinic moribund, while of type B, the severely infected, there were 98 cases, leaving 299 who were examples of mild or moderate infection The total number of deaths was 20 which included the three admitted in a dying condition Of the remaining 17 no less than 9 occurred in Group A, embracing those who were not reckoned as severely infected on admission, the other 8 cases belonging to Group B In 34 cases the antitoxin appeared to be quite mert, so far as influencing the course of the disease was concerned In 190 others the action of the antitoxin was problematical, which leaves 156 only in which the remedy appeared to have acted specifically and In this last series no other treatment was given, so that the action of the antitoxin was decisive Hence in nearly 40 per cent the latter did all that could have been expected of it and 50 of the cases thus influenced belonged to Group The tabulations appear to show that the remedy was at its best in the severe group, for here the percentage of favorable results was nearly 50 In regard to untoward effects there was nothing serious observed, although in 10 per cent or so

sponsible for gall-bladder disease. In any case it appears to antedate the latter, and extirpation of the appendix is sufficient to cure certain cases of the other malady However, as a rule the gall-bladder must be operated on. It should not be understood that the author did not make the diagnosis of appendicitis in his patients before operating, but the disease had been overlooked by others, the symptoms either being lacking or set down to the gall-bladder mischief the patients had ever had a crisis of acute appendicitis, the evolution had been cold throughout, and neither the patient nor the attending physician had ever thought of the possibility of appen-The appendix in all cases was diseased to the naked eye The gall-bladder was the seat of cholecystitis or cholelithiasis In two cases no operation on the gall-bladder was necessary, in four others the appendix was first removed, and this was followed by cholecystostomy, finally in the remaining two a single incision was made and the appendix and gall-bladder both were excised, The author's long study of the former first latent appendicitis has led him to recognize the existence of three groups of affections secondary to it, viz, affections of the liver (gall-bladder), stomach, and nervous system — Bulletin de l'Acadénne de Médecine, Jan 3, 1928

Innervation and Tumor Growth -In a preliminary report Horst Oertel, writing in the Canadian Medical Association Journal, February, 1928, xviii, 2, describes in detail the technique by which he has been able to demonstrate a nerve supply in several types of human carcinoma and sarcoma. In all of these, nerves were found, not only in connection with the blood vessels or stroma, but intimately connected with the cellular parenchyma, even with the individual cells of the tumor his technique improved, so also has increased the frequency with which—in their abundant distribution and finer ramifications - nerves have been demonstrated in tumors fibers and fibrils thus discovered are nerves is based, in addition to their selective staining, upon their distribution, method of branching, characteristic manner of approach and intimate relation of the terminal fibrils to the parenchymatous cells and nuclei In a brief discussion of the significance and bearing of the nervous system in tumors Oertel refers to the observations of Lenthal Cheatle, about twenty-five years ago, who pointed out the curious relation which certain squamous cell cancers and rodent ulcers of the skin have to the distribution of cutaneous nerves, more particularly the fifth cranial nerve, and that their occurrence is often incident at the socalled "maximum point" of Head, which Head assumed to be the point of greatest nerve radiation These findings, together with those

of more recent investigators, indicate the importance of innervation in the development and transplantation of artificial cancers in animals, and also that the absence of nerves not only does not predispose to, but rather tends to interfere with the prompt development and extension of experimental cancers. To the fact that the tumor possesses its own blood supply, and that the vascular construction precedes the actual growth of a tumor must be added the evidence that the actual tumor is an innervated tissue, and stands, therefore, in some relation to the nervous system indicates that the tumor problem extends beyond the tumor cell to the whole functional and structural complexity of tumor organization and growth. If these observations are further substantiated, the conception of "in dependence" and "autonomy" in tumor cells will have to be modified or interpreted ac cordingly

The Etiology of Pernicious Anemia Is It Secondary to Hepatic Infection?-After reviewing various hypotheses advanced to explain the etiology of pernicious anemia, Seale Harris concludes that it seems probable that the liver secretes an endocrine (antihemolysin) which controls the hemolytic action of the reticulo-endothelial Kupffer cells in the liver and perhaps in the spleen and bone marrow (Southern Medical Journal, February, 1928, xxi, 2) The pathological changes in the liver found in pernicious anemia and the association of gall-bladder infections with the disease suggest that a chronic hepatitis may inhibit the action of, or destroy the liver cells that secrete antihemolysin resulting in uncontrolled red While it is unlikely that there blood destruction is a specific infection responsible for the production of pernicious anemia it is probable that many pathogenic bacteria, by producing hepatitis involving the endocrine secreting cells of the liver, may be factors in the etiology of the dis-Achlorhydria may be either a concomitant condition or it may be a contributing factor through its influence in producing hepatitis fact that the blood picture returns to normal and the pernicious anemia patient's general condition improves following the ingestion of liver, while the symptoms referable to the spinal cord remain unchanged, indicates that the latter are probably due to infection of the cord by the same pathogenic agent that produces the changes in the liver Since the anemia is relieved by and stomach liver diet, while other pathological conditions remain unchanged, it may be deduced that the liver changes and the consequent severe anemia are only a part of a rather widespread toxic or infectious process In this sense pernicious anemia is not a primary anemia, but a secondary one

LEGAL

By LLOYD PAUL STRYKER, Esq Counsel, Medical Society of the State of New York

THE ANNUAL REPORT OF THE COUNSEL

The following report covers the activities conducted by the Legal Department of the Medical Society of the State of New York during the twelve months from March 1, 1927, to February 29, 1928

Your counsel has had a year filled with responsibility and hard work. The various tables hereto appended give a statistical statement of the results achieved, but no mere tabulation of figures can present a complete picture of the nature and weight of the responsibilities which your counsel has en deavored to shoulder

As heretofore the warmest acknowledgement is made of the kindly, effective and intelligent assistance and cooperation which has been uniformly accorded to your counsel by the various committees, representatives, officers and individuals of your society. With this added year's opportunity for study and reflection, your counsel trusts that he has acquired an even firmer grasp of some of the problems of the medical profession, and has attained to an even higher appreciation of the ideals and standards which guide and control practitioners of the healing art

A convenient category heretofore adopted for a consideration of the year's work would divide the activities into three divisions, (a) the actual handling of malpractice actions before courts and juries and in the appellate tribunals, (b) counsel's work with officers, committees and individual members of the society and (c) legislative activities

LITIGATION

Table I hereto appended gives a comparison of the number of suits instituted and disposed of in the years 1926-1927 and 1927-1928 From this it will appear that during the past year 177 new suits were instituted as compared with 166 the year before During the present year 126 cases were disposed of as compared with 146 in the previous year. It will be noted further that through verdicts obtained for the defendant after trial or through dismissal, discontinuance or abatement, 92 cases were disposed of and 31 cases were settled. Throughout the entire year there has been but one verdict for the plaintiff.

Perhaps only those of your members who

have had the actual experience as defendants in malpractice actions can have a complete understanding of the nature and extent of this defense work, and even those who have heard their rights and good name championed in court have only in part learned of the character and extent of the task devolving upon your counsel in each case. Sometimes a physician believes that when a summons and complaint has been served upon him and this has been forwarded to us, nothing further is done or is necessary to be done until such time as two or more years thereafter he is informed that the action has been disposed of by motion or he is notified to appear at the trial of the case It would seem, therefore, that it might

there was a rash with temperature rise— Munchener medizinische Wochenschrift, January 27, 1928

Serodiagnosis of Amyloid Disease—Recently an article appeared on the subject of diagnosis of amyloidosis by biopsy carried out by hepatic puncture R Steinert in an article in the Khnische Wochenschrift for February 5, 1928, covers the subject of diagnosis of the same condition by ordinary serological methods for the first step in this advance is awarded to Loeschcke who published a paper on the subject in 1926 and made use of an antigen-extract prepared from leucocytes, by means of which he was able, in various cases of chronic suppuration, to obtain a pronounced precipitation reaction Chronicity is a basic condition and the test remains strictly negative in all acute suppurations However the reaction is also negative or at least but weakly positive in various known cases of amyloidosis The author has ingenious theories to explain the positive results and the failure to obtain them in certain cases, while it is also true that conditions other than amyloidosis may react The author's tabulation of 40 cases positively proves a disappointment, for only 11 cases appear to have given the positive reaction The test is especially disappointing in chronic bone and joint suppurations of tuberculous origin. In six cases of positive results controlled by autopsy the diagnosis made serologically was confirmed far the author concludes that the reaction is not so much characteristic of confirmed amyloidosis as of conditions which lead up to the latter we obtain it in patients with mild chronic suppuration with general condition still good, we should at once proceed to thorough evacuation and drainage of all suppurating surfaces far there has hardly been time to follow up the negative cases, but in one instance a negative reaction was followed 9 months later by a weakly positive one, the patient suffering from fistulous hone tuberculosis

Statistics of Postoperative Pulmonary Embolism -W Scheidegger gives elaborate statistics from the surgical clinics of Basle and Berne running from 1910 to 1923 inclusive, during which period the total number of surgical interventions reached 20,779 The chief operator was Professor de Quervain The total number of cases of pulmonary embolism was 143, a per-The operations most apt to be centage of 0.69 followed by this sequel were directed against cancer of the gastroenteric canal, and singular to relate there is greater danger here from exploratory laparotomy than from radical intervention To state that 143 cases of embolism developed is by no means the same as to state that embolism was the actual cause of death, for this was true in only 0 19 per cent. In other words, in most cases pulmonary embolism was only a complica-

tion which did not conduce to a fatal termination In fatal embolism most cases were examples of post-operative infection—that is the operation was not aseptic throughout. The source of the embolus in these cases was more apt to be in the thrombosed deep veins of the lower extremities (55 per cent) In the majority of cases the symptoms developed on the third post-operative In about two out of five cases both lungs were the seat of emboli, while in unilateral cases the right lung was somewhat more likely to be the side preferred Sex played no rôle and season of year played no role. Age was of course a factor, for increase of years favors the formation of both thrombosis and embolism Patients with lesions of the circulatory and respiratory apparatus are more likely to suffer Hence if we would sum up the leading factors, these comprise cancer (of the stomach especially), advancing years, post-operative wound infection, exploratory laparotomy rather than radical surgery, and previous lesions of the circulatory or respiratory organs -Schweizerische medizinische Wochenschrift, January 28, 1928

Treatment of Intestinal Diseases with Garlic -Dr Erbach, formerly a police surgeon of Altona, encountered many cases of intestinal maladies during his service and always sought for means to shorten the duration of disability Some years ago Professor Roos of Freiburg announced that garlic was of value in this group of maladies, although the mechanism is He has now finished his first not apparent series of fifty cases for which he made use of a certain preparation of garlic which made it possible to administer it in dragées The conditions treated could be summed up as acute and subacute catarrhs although cases of mucous colic are also mentioned. As a rule, the symptoms were favorably influenced after about 48 hours, the stool becoming of normal In exceptional cases it took longer-up to two weeks, such cases being chiefly subacute and of longer duration, but the improvement, however slow, was steady The most remarkable result obtained, however, was in a case of mucous colic which had lasted 30 years in which every act of taking food produced violent pains followed by a copious thin dejection This patient improved at once on the garlic and after several weeks was completely cured, and for the past 18 months there has been no relapse. The sedative action of garlic on the intestine is so marked as to sug-Thus far the author gest narcotic properties has never seen the diarrhea succeeded by any notable constipation He hopes that laboratory men will take up the study of garlic to discover the medicinal principles and the mode of action -Muenchener medizinische Wochenschrift, January 13, 1928

examination of the medical literature. For this purpose your counsel has built up quite a complete medical library of his own. Frequently, however, resort is necessarily made to a research through the various medical journals and other sources of information. After your counsel has made this study of the medicine, further conferences are frequently required with the defendant physician or with other physicians in order that we may be equipped with the most complete knowledge possible of the particular scientific question of medicine with which the trial is bound to concern itself.

In addition to all this, while in general the legal principles which control actions of this character are the same, no two cases in law any more than in medicine are identical, and a separate special brief upon the law of each case is prepared, with particular reference to the special facts involved. In order to facilitate this work, your counsel has on file a complete tabulated and cross-indexed record of malpractice cases of this and other states, which is continuously brought down to date

In a brief way there is thus seen some of the work of your counsel involved in each case—work "behind the lines," of which physicians usually are wholly or only in part aware

In addition to all of the foregoing, it frequently happens, especially in cases outside the metropolitan area, that a large and voluminous correspondence is carried on In some cases the correspondence file will in each case involve fifty or more letters. It is only through a preparation of this kind that the work is successfully carried on, that the number of verdicts for the plaintiff (last year only one) are so few, and that plaintiffs' attorneys in many instances become convinced that the likelihood of their success is so remote as to finally cause them to consent to a discontinuance, or to be unable to prevent a discontinuance upon our motion

Some cases are more serious than others, some require greater research and greater preparation, but there is no case in which preparation in accordance with the foregoing principles is not made

Owing to the volume and extent of the work, your counsel believes that a successful handling of the same would be impossible, but for the intelligent, systematic and prompt cooperation and assistance which he uniformly receives from the various branch offices of the insurance carrier. These offices are located in the various cities throughout the state and their representatives interview witnesses and assist in the preparation under our direction from this office, usually by mail, often by telegraph not infrequently by long distance telegraph

phone Also the representatives of these offices take care of the cases on the calendar and keep us thoroughly apprised of the time when each particular case will come on for trial So far as this work is concerned, the various branch offices of the Aetna Life Insurance Company in Albany, Syracuse, Rochester and Buffalo, virtually act, so far as cooperation and assistance are concerned, as branches of your counsel's office

Your society could not have a complete knowledge and report of your counsel's work were it not at least apprised of the assistance which he receives from a highly trained and well organized staff which he has been able to build up All of you are acquainted with Mr Robert Oliver and his able and efficient service Many of you have become acquainted with Mr Lorenz J Brosnan, whose cooperation and assistance have been increasingly valuable and important During the past year he has himself tried several of the cases with a one hundred per cent record of success addition to these two gentlemen, Mr Maxwell C Klatt, another member of the bar, is likewise an assistant upon your counsel's staff, and through his training in this work has become of increasing value and assistance Mention also should be made of the stenographic and other clerical force in your counsel's office His three stenographers are all trained, not only in the nomenclature of the law, but are now as familiar with medical terms as the average well-educated trained nurse stenographer without such training would be of little value in your counsel's office entire staff then, both professional and clerical, has attained to a real understanding of the problems involved and renders an assistance and cooperation which are literally invaluable

Before any case is tried it becomes necessary for your counsel to examine and study every paper in the case, including every letter, motion paper, affidavit, brief, memorandum, research of medicine, etc It becomes his duty to weigh and consider this examination, and from his conferences with the defendant doctor, what are the true merits of the case Perhaps at this point the greatest burden and the heaviest responsibility is thrown upon your counsel's shoulders For let it be understood that not every action which is brought is without merit, not every case of malpractice is unjustly brought Doctors, despite their scientific knowledge and their experience are only human beings and they share in connection with the rest of mankind, the qualities of fallibility and the capacity to err and make mis-Sometimes these errors and mistakes are vital and are the direct contributing cause

392

not be without interest to give something of a detailed statement of what is involved, from our point of view, in the defense of every case

Upon receipt of a summons and complaint, the necessary entry and record of it are made in our office, and where the physician is insured, information is transmitted to the insurance carrier, as required by the policy, so that he may receive the full benefits of his coverage An examination is then made of the complaint to determine whether it states a cause of action or whether any motion or motions should be made thereto, such as to strike out irrelevant or redundant allegations which may be detrimental to the defendant, to compel the plaintiff to separately state and number his causes of action should the complaint contain more than one cause of action, to dismiss the complaint on the ground that the cause of action is barred by the Statute of Limitations if the malpractice complained of antedated the institution of the action by more than two years, and a further consideration whether, in addition to these motions, any others may be necessary If a motion is deemed necessary the preparation of a complete set of motion papers is required, sometimes embracing twenty or more pages, a complete brief upon the law of the motion is prepared, the motion is then orally argued in court and thereafter frequently appeals are taken by the plaintiffs to the appellate courts or, should we be unsuccessful appeals are taken by us, in which case printed records must be prepared, printed briefs gotten ready and another argument in the appellate court

If no motion is made in connection with the complaint, an answer must be prepared and served In the preparation of the answer, a statement from the defendant of his examination, diagnosis and treatment of the plaintiff is procured. For an amplification of the allegations of the complaint it is ofttimes necessary to procure a bill of particulars This is done by demand, but if the demand for a bill of particulars is not complied with, then a motion must be made to compel the service of a bill of particulars After the answer has been served in behalf of the defendant, issue has been joined and either party is at liberty to place the case upon the calendar, where it takes its position and awaits its turn for trial

In order that the most complete and thorough preparation of each case may be made, this preparation is always begun immediately upon the receipt of the case in our office in order that the statements of the various witnesses may be procured while the facts of the treatment or operation are still fresh in the minds of the witnesses. In this connection, not only is the defendant physician interviewed

(not only through our investigator, but usually on one or more occasions personally in this office), but likewise any other physician who may either before or after the treatment complained of have attended and treated the plantiff, likewise the nurses, internes or other assistants who may have knowledge of the facts are interrogated and their statements For the proper accomplishment of this work trained investigators are necessary, who are possessed of medical knowledge and skill in this line of work If the patient has been in a hospital, the hospital record is procured, which should include the history chart, the operating chart showing in detail the nature and extent of the operation, laboratory reports, if X-rays were taken, either the negative X-ray films or reprints of the same, and the roentgenologist's interpretation of the X-All of the facts and records are carefully collected and preserved in the file of the particular case in our office, in convenient and systematically tabulated separate folders, where they are kept for immediate reference and for final use upon the trial In the event a case is brought for the death of the patient it, of course, is necessary to procure a copy of the death certificate and if the medical examiner has been called into the matter, the procurement of the autopsy protocol, all of which are carefully examined, considered and studied

In very many of the cases, in order to equipourselves with a complete knowledge of the nature and extent of the injuries complained of, a physical examination of the plaintiff is secured. Frequently this is obtained by the consent of the plaintiff's attorney, but where this consent is not given, it is necessary to make a motion for this examination to procure an order of the court compelling it

In a great many of our cases plaintiffs' attorneys secured orders for the examination of This order is prothe defendant before trial cured as a result of a motion in court with the usual requirement of affidavits, motion papers, Where, for example (as is argument, etc frequently the case) the notice for the examination does not comply with the statute or is too broad in its demand, or seeks to procure information from the defendant which the plaintiff is not entitled to, a motion is then made by us to vacate or modify the notice for When the examinaexamination before trial tion is finally held it is necessary to attend upon it with the defendant while he is being examined by the plaintiff's attorney to protect the defendant's rights and to prevent the giving of answers to questions which the law does not permit

Many of our cases involve intricate medical questions which require a careful and extended

...

lars, it will now award double that sum or more. Juries have become increasingly liberal with the money of defendants in every other field of negligence cases when they find against them."

Through a column and a half of his last report, your counsel dilated upon the reasons for the trend of larger verdicts in negligence cases and he will not here repeat himself, except to refer to what he then said and to assert that all the statements there made still hold good

Of the cases disposed of last year 33 were for operations, either abdominal, eye, tonsil, ear, etc 26 cases involved obstetrics, 14 were the result of X-ray burns, 12 arose out of fractures, the other cases are classified in Table I A great number of the hereto referred to cases which have arisen resulted from alleged This complaint was neglect in after-care made in nearly every tonsillectomy case Some of the physicians specializing in tonsillectomy have made a practice of doing the operation in their offices and sending the patient home the same day Frequently hemorrhages have thereafter occurred and where the physician has not been sufficiently prompt or attentive in the after treatment, resentment (whether just or not) has occurred, resulting in malpractice actions Many of the cases involve the retention of foreign bodies, not only broken needles but surgical packs, drains, etc Too much care cannot be exerted by the operating surgeon to insure that when the patient is discharged, every foreign body which has been inserted has been removed Sometimes this work is left to internes or nurses, with the result that while the doctor was perfectly conscientious in believing that the foreign body had been removed, in fact it was not removed Later a sinus developed and a second or a third doctor performed an operation and removed the foreign body Cases of this kind present clear liability and they nearly always necessitate settlement.

Then, too, too much care cannot be exerted, especially in abdominal operations, in making the necessary sponge count so as to insure that the number of packs which were put in the body of the patient were accounted for and that the number removed tallies with the number which were inserted. This has not always been done. Where it was not done cases of clear liability have arisen

A large number of cases have arisen from the use of X-ray and other mechanical modalities. The use of X-ray in the most skilled and competent hands involves the highest amount of care and knowledge. Sometimes physicians have equipped their offices with X-ray apparatus, but have not been sufficiently trained in its use, with the result that injuries ensued. Oftimes in the use of these various modali-

ties, such as baking machines, etc, while the treatment is going on the physician has left the patient alone or in the care of an inadequately trained assistant, with the result that burns and other injuries have ensued. Such instances have been the occasion of cases involving unquestioned liability. Every detail of X-ray therapy should be conducted by a competent physician, especially trained in this work and he should never leave the patient while the person is undergoing treatment.

No busy practitioner of the healing art is exempt from the malpractice hazards. Some of the cases which your counsel has defended have been brought against physicians of the highest standing and the most unquestioned skill. In every detail of diagnosis, prescription, operative procedure or treatment, the physician or surgeon must bring to bear not only the most thorough scientific training, knowledge and experience, but a sensitive and well organized conscience. The failure to possess any of these is hazardous, not only for the patient but the physician as well

At this great length your counsel has deemed it proper to consider in some detail some of the features of his defense work Although he has lived in an atmosphere of criticism of doctors and the medical profession. he has not overlooked the fact that when the whole number of physicians in the state is considered and the enormous number of treatments and operations which they perform, the number of bad results is gratifyingly small But the fact that bad results have occurred and that many of them are due to a failure properly to diagnose or treat, 1 e, to negligence, should not be overlooked or ignored While some cases brought may justly be characterized as savoring of a blackmail character, it would be blinding our eyes to assert or to believe that every malpractice case is of that kind

It is because of the truth of the foregoing statements that the group insurance plan was originally instituted through the diligence and foresight of your officers in 1921, and has been centinued with such marked success ever since. The appreciation of its merits and its value is revealed through a study of Table II here appended, which is a comparison of the number of members insured in 1925, 1926, 1927 and 1928, as well as the number of members in the county societies and the percentage of insured members From this it appears that in 1925, 5,323 members of the State Society or 51 per cent of the entire number were insured, in 1926, 5,711 or 53 per cent were insured, in 1927, 6,073 or 56 per cent were insured, and in 1928, 6,488 or 58 per cent were In some of the larger counties the figures show a gratifying appreciation of the

394

of the injury or the death complained of Where cases of this kind are encountered (and during the past year 31 such cases were encountered), your counsel after careful study and especially after conference with the defendant doctor, has negotiated the best settlement possible to be made Every settlement so made is made with the consent and approval, and usually at the urgent solicitation of the particular physician involved Sometimes the injuries in such cases are slight, sometimes they are grave, the amount of the settlements made necessarily is in proportion to the gravity of the injury

No more difficult or responsible duty devolves upon your counsel's shoulders than this question of settlement. As a general rule it is believed safe to assert that the difficulty and strain of trying a case is far less than that involved in making a settlement, and yet your counsel can think of many cases in which had no settlement been made very heavy verdicts would have been inevitable, thereby injuring the doctor and the profession itself Uniformly in considering questions of this kind, your counsel has found the physicians to be actuated by the highest principles of fairness and right, and when settlements have been made because of the error or mistake of the particular physician, no one is more pleased that the injured patient should thus receive his just recompense than the doctor himself settlements in serious cases not made, the group fund which is built up through the premiums of the various members of the group, would in a short time be so diminished by large verdicts that the insurance plan could not go on at all, and only at such rates as would be prohibitive. In considering the making of a settlement, therefore, your counsel has first to consider the true scientific merits of the case, the rights of the accused doctor, the true principles of justice involved and the proper protection and conservation of the group fund Questions of this kind are always before us

In no case, however, is a settlement made except with the full approbation of the doctor and except upon our conviction that the injury complained of is justly attributable to the error of the physician. If there is merely a bad result (which is always possible to occur, even with the best of care, skill and treatment), the doctor is defended to the limit of our strength in court and with results which we believe speak quite sufficiently for themselves. There is no more fascinating or important kind of case to defend than that of the malpractice action. It involves every element involved in the trial of an ordinary-case and in addition to this, the handling of complex, intricate,

difficult scientific questions and the interpretation of these questions in such a form as will make them intelligible both to the trial judge and to a jury of laymen. In addition to the possible pecuniary loss involved in each case, your counsel is never without the sense of responsibility involved in the protection of the good name and reputation of the accused physician.

Your counsel does not frequently dilate upon the subject heretofore treated, although from time to time in his editorials in your Journal some suggestion of the nature and extent of the problem is touched upon. At the end of each month, however, a careful, complete and accurate statement is made to the Secretary of your society, which embraces all of the work accomplished during the preceding month. It contains a statement of the number of new cases instituted, disposition of cases made and the particular nature of such dispositions.

Doctors practice an extra-hazardous profes-Even with the greatest skill, fidelity and conscience bad results are bound occasionally to ensue, and where they ensue they may become the basis of malpractice suits Where, for instance, a patient has died as a result of an operation, or has lost a limb or the function of a limb, or has received an X-ray burn, or has otherwise been injured, there is always danger for the doctor whether he was negligent or not, as it is always difficult to bring a lay jury to an understanding of the difference between injury and negligence The hazards of the practice of medicine have been dwelt upon by your counsel and his predecessor in private conferences and in addresses before the County Societies, in editorial columns of the Journal and in annual reports

The readers of the lay press are familiar with the enormous verdicts which juries have been wont to render in other departments of the negligence field Forty or fifty thousand dollars for the loss of a hand or a foot is nowadays not an unusual verdict Your counsel can recall verdicts of even greater amount Fortunately, no verdict of this kind, under your counsel's administration or that of his predecessor, has been rendered The danger is al-In his last annual report your wavs there counsel quoted an excerpt from the report Although made by him in the previous year this will be the third time this statement has been made, we deem it advisable to quote that statement here again

"Perhaps it might not be out of place here to notice how fortunate the doctors have been thus far in avoiding large verdicts. The trend of the times in every other field of negligence law is unquestionably toward larger damages where juries find in favor of the plaintiff. The present value of the dollar is always taken into consideration, so that it is safe to say where a jury ten years ago might have rendered a verdict for ten thousand dol-

In Kings County, for benefits of the plan example, the number insured in 1925 was 48 per cent, in 1926, 52 per cent, in 1927, 57 per cent, in 1928, 62 per cent. In New York County, in 1925, 52 per cent, in 1926, 57 per cent, in 1927, 59 per cent, in 1928, 60 per cent In Queens County, in 1925, 50 per cent, in 1926, 54 per cent, in 1927, 58 per cent, in 1928, 67 per cent

What your counsel has so many times asserted, he here repeats—that the group plan is working well. Not only is it working well, but the assistance and cooperation which, through the various agencies of the insurance carrier are afforded, it is believed are indispensable to a proper conduct of the defense It is distinctly a Society activity has received the increasing support and confidence of your members and it is deserving of even greater confidence and support

COUNSEL WORK

During the period of this report, your counsel has prepared for publication in the Society's journal articles in the nature of editorial comment The editorials have included the following

The Hazards of Malpractice Suits

Dr Casper Pendola, Martyr

Preventive Methods as Applied to Litigation. The Power of the Federal Government to Regulate the Practice of Medicine

An Erroneous Decision (holding a chiropractor not guilty of practicing medicine without a license)

The Annual Meeting

The Address of the President of the United States The House of Delegates of the A.M.A. Takes Its Stand Against the Enactment of Restrictive Laws Regulating the Doctor's Right to Prescribe Such Therapeutic Agents as He May Deem Necessary

The Supreme Court of the United States Upholds the Virginia Statute Providing for the Sterilization of Men-

tal Defectives

The Summer Vacation

The Practice of Medicine an Extra-hazardous Under-

With Saber and Scalpel

The Prevention of Ophthalmia Neonatorum

A Brief Excursion into the Early Medical Legislation. Early History of the New York State Medical Society Our Society and Its Division and Reunion

The Endorsement of Commercial Products by Physi-

The Medico-legal Aspects of Drunkenness Recent Application of Statute of Limitations to Mal-practice Actions and Counterclaims.

The New Year

The Function and Purpose of This Page The Governor's Message

Law, Its Origin, Growth and Function.

As in the past, counsel has digested and there have been published in the Journal reports upon malpractice actions which have been disposed of by your counsel The case reports published during the previous year are as follows

Pregnancy-Injection of Piturin Followed by Abscess Plastic Operation with Resultant Saddle-nose.

Burn in Administration of Electrical Therapy Diphtheria Causing Acute Myocarditis and Death. Failure to Diagnose Appendicatis Resulting in Death. Fracture of Clavicle and Condyle of Humerus-Impairment of Flexion.

Claimed Burn in Baking of Pott's Fracture.

Claimed Negligence in Operation, Resulting in Blood Poisoning and Pleurisy

Physicians' Hazard in a Lunacy Commitment Multiple Breast Abscesses—Puerperal Sepsis—Death Broken Needle in Hypodermic Injection. Retained Placenta—Vaginal Fistula.

Claim Arsenic Poisoning

Removal of the Middle Turbinate and Polyps Followed

by Meningitis and Death.

Abrasion of Breast While Applying Bandage.

Spiral Fracture of Humerus—Open Operation Malpractice Counterclaim

Colles' Fracture-Slight Deformity Uterine Bleeding—Claimed Abortion, Still-birth Due to Quinine and Morphine Peritonsillar Abscess

Wrong Diagnosis of Pregnancy Tonsillectomy—Removal of the Uvula

Ringworm - Improper Prescribing of Ammoniated

Foreign Body in Hand.

Non-payment of Bill-Malpractice Counterclaim.

X-ray Films—Partial Alpecia.

Fracture of Radius and Ulna—Permanent Non-union. Fracture of Ankle.

Claimed Negligent Removal of Uvula During Tonsillectomy

Tonsillectomy and Adenectomy-Death. Intestinal Toxemia and Convulsions Post-partem Hemorrhage—Placenta Praevia—Death Congenital Dislocation of Hip—Thrombosis—Gangrene

-Subsequent Amputation of Toes and Foot,

The editorials and case reports thus prepared for publication in the Journal by your counsel covered from two to six pages in each of the issues of the Journal and consisted of about sveenty-six thousand words The preparation of the editorials required a considerable amount of time and necessitated research into the facts and the law of the subjects written upon Likewise the digesting and reporting of the cases previously disposed of required a careful review of the facts in each case and a careful preparation of the digest

The editorial work and the work of preparing case reports have been of great interest to your counsel and he has been gratified by the frequent appreciative references to this work It is difficult and exacting, and the aim of your counsel has been to lay before your Society and its members, from time to time, discussions of a timely character which will be of interest and benefit to the profession as a whole, as well as to its individual members Where suggestions have been made for editorials, wherever possible, your counsel has taken up a consideration of the question suggested and has endeavored, to the best of his ability, to elucidate it Your counsel has at no time written under any delusion of omniscicuce, but merely in the hope, that through his constant contact with the profession and its

ficers of your Society, among other questions, upon the following

The contract between the Society and Barnett-Maynard, which provided for the erection of booths for the

annual meeting

Inquiry and investigation of complaint by Schenectady County Society that the General Electric Company was conducting a hospital, unlawfully practicing medicine and unjustifiably competing with the physicians of Schenectady

Advice with respect to the decision of the Commissioner of Motor Vehicles in regard to the appointment of optometrists, but no oculists to examine applicants

for chauffeurs' licenses

Interview and communication in connection with person organizing a corporation for prevention of disease. Advice with respect to the practice and agreements by the Society in the procural of its advertising for its publications

Your counsel attended the meeting of the Society of Medical Jurisprudence, and discussed a paper on the Legislative Control of Cosmetics

Your counsel attended and delivered the main address at the Tri-State Conference, a paper on the Consideration of the Need of Legislation Bearing upon the Question of Ex-

pert Medical Testimony

Your counsel received communications from the Executive Committee with reference to the amendment of the by-laws of Otsego County Society, and examined the proposed amendments thereto and gave an opinion with reference to such amendments

With respect to the controversy between the Cattaraugus Medical Society and the Milbank Health Demonstration, at various times your counsel has received communications from the office of the county society and from your Society, and advised with respect to various phases of the controversy

LEGISLATION

In connection with the legislative matters, your counsel has at various times examined bills pending before the Legislature, conferred with the members of the Legislative Committee, and advised with respect to such bills, and prepared memoranda and briefs in support of or in opposition to various legislative measures

From an intimate contact with your various committees, your officers, both of the society and of the various component societies, the sincere belief is entertained that never before have your affairs been in a more promising condition. Your society is working with a vim and a will for the solution of the various problems that fall within its jurisdiction and with a sympathy and understanding of the wishes and the needs of the component societies and of the various individual members. The ranks of the profession are constantly recruited with new blood, and this is reflected in a gratifying increase in our membership. In

1925 there were 10,410 members, in 1926, 10,677, in 1927, 10,829 and in 1928, 11,259

The gratifying results obtained through your counsel's office could not have been secured but for the cordial, friendly and cooperative assistance rendered him at all times by your members 'Very frequently in the preparation or the trial of cases, your counsel has had to resort to your various members for medical advice and assistance and at all times in the assertion of just defenses (and no other defenses have been asserted), doctors have come forward voluntarily to render their expert testimony in support of their unjustly accused brethren Opinions of the highest scientific value have been rendered in this way gratuitously and for no other reason than the assistance in the protection of doctors' rights and in furtherance of justice

Throughout the year as heretofore, your counsel has been thrown in contact with the officers and representatives of your insurance carrier and at all times has secured their loyal and sympathetic cooperation. Doubtful questions of coverage or other disputed matters have uniformly been resolved in favor of the

doctor

Your counsel believes that the thanks of the profession are due to your authorized insurance representative, Mr Harry F Wanvig, to whom in no small degree is due the credit for the increased and continued support of the His courteous, intelligent, able group plan and sympathetic assistance in all matters involving this important activity of your society entitle him to your complete confidence and support Mr Wanvig's entire time is devoted to his work as your authorized indemnity representative In attendance at the various meetings of the County Societies, and in personal conference with the physicians and otherwise, he has at all times evinced a willingness to be of service to your members and has generously given of his advice and assistance in the furtherance of the group plan

Your counsel wishes that the general public might attain to his present knowledge and understanding of the medical profession. As a group he has never encountered a body of men of finer ideals and it is indeed a privilege for him to record that in the ranks of your profession there are numbered many of his warm-

est and most valued friends

Your society, with a history almost as long as that of the United States, has every reason to look forward to the future with confidence and optimism, and actuated by a just pride in its manifold achievements to believe that the vista of the coming years presents even wider opportunities for service

LLOYD PAUL STRYKER, Counsel LEGAL

various members, with their problems and with their hopes and fears, that he might by helpful and timely suggestion assist in the solution of the various problems at hand, or of the questions in which the profession at the time is generally interested

Inquiries from various sources for advice and opinions upon various subjects are being constantly received by your counsel inquiries come from county societies, officers or committees of such societies, members of the society in various parts of the State, associations allied to or interested in medical subjects and from lay persons seeking information upon medical or medico-legal matters inquiries are made by personal calls, telephone calls and correspondence Some of the inquiries which have been a matter of advice and opinion are as follows

Does the taking by lay representatives of laboratories of a specimen of blood from the veins of patients for diagnostic purposes constitute the practice of medicine?

Inquiry as to the advisability of advising the father of a patient as to the breaking of a needle during the course of an operation

Communication with respect to the diagnostic symptoms of fractures and the determination of the presence

of a fracture

Communication and advice as to the obligation of a physician with reference to the disclosure of confidential communications existing between the patient and physician, and whether a physician can disclose such information to the Workmen's Compensation Bureau

Advice as to the contract relation existing between the physician and the patient, the duty of the physician to attend and treat the patient, and when the relationship may be terminated, and the giving of notice to the

patient of the termination of such relation.

Advice as to the ownership of X-ray films, whether such ownership is in the patient or in the Roentgenologist, and whether the patient has the right to demand from the Roentgenologist the possession of the X-ray films

Inquiry and advice as to the responsibility and liability of a hospital and physicians in the employing of a nurse who had been dismissed from another hospital for giving medicine without authority

Communication with respect to the performance of duties by unlicensed practitioners in psychoanalysis, and whether the work they were doing constituted the practice of medicine in violation of the law

Advice to a physician as to the defense of a malpractice

action defended by another attorney

Advice to a physician with reference to the disposition and settlement of a claim made against him, and the preparation of the necessary releases

Further communication and advice with respect to the ownership of X-Ray films, whether in the Roentgenologist

or in the patient.

Conference with an anaesthetist as to the adminstration of anaesthesia by nurses, comumnication and advice as to a hospital's right to employ nurse anaesthetists, and the liability of a surgeon where a nurse anaesthetist is used

Communication with respect to the rights, privileges and coverage of physicians under the State Society's

Group Plan of insurance.

Communication with respect to the Statute of Limita-

tions applicable to malpractice actions

Advice to a physician with respect to notification to patient and attempt to remove needle which had broken off in the course of an operation

Communication and advice with respect to the procural of consents of patient and of husband, wife and next of kin to the performance of an autopsy and the procural of the temporal bones of deceased persons

Advice to an officer of the society as to whether a complaint made against a member of the society warranted proceedings before its Board of Censors

Communication and advice as to who is permitted to practice physio-therapy, that such practice can be carried on only by a duly licensed physician, and the physictherapist is not permitted to administer drugs, and the liability of a hospital or physician in the appointment and employment of a physio-therapist upon its staff

Comunication, conference and advice to a physician with respect to writing and publication of medical arti-

cles by him

Communication and advice with reference to the Medical Practice Act, and violations of the same.

Advice to a physician as to whether or not expenses incurred in attending medical meetings are deductible from income tax.

Inury and advice as to whether a county society can accept bequests for the purpose of raising a building

fund for said society

Communication and advice where a female having no symptoms other than those pertaining to appendicitis, upon entry to a hospital requests removal of the Fallo pian Tubes at the time of the performance of the appendectomy, as to whether it would be legal to comply with such request.

Conference, communication and advice to a physician as to the rights and powers of such physician engaged as a medical supervisor of an institution or sanitarium, to have complete jurisdiction over sickness occurring in such institution, and hygiene and sanitation of the same.

Examination of court opinion and advice to a physi-

cian as to the holding and effect of such opinion. Communication with respect to the reprinting of editorial articles appearing in the Journal

Inquiry as to whether a physician was at liberty to disclose to an insurance company the nature of the injuries and treatment that he has rendered to a patient, where such patient has made a claim for damages to recover for such injuries

Communication and advice to a physician as to whether or not an Osteopath has the right to demand admission of his patients to a hospital maintained by the city, and also whether the Osteopath has the right to demand to continue to treat such patient after admission

to the hospital

Inquiry, communication and advice as to the actions of a physician and the investigation of the conduct of such physician by the state body

Communication and advice to a physician as to his obligation and duty with respect to the information to

be supplied on a birth certificate. Advice to a physician with respect to the institution of an action to collect for services rendered, and the probability of a malpractice counterclaim

All the preceding inquiries and communications required considerable investigation and frequently involved the giving of legal opinions and careful analysis and interpretation of legal questions

Your counsel and attorney both personally attended the last annual meeting of your Society, and either your counsel or attorney attended at each of the meetings of the Council and Executive Committee during the year

From time to time, the Executive Committee and the officers of your Society have sought the advice of counsel upon various subjects and matters pertaining to the Society's busi-Your counsel has had occasion to advise the Council, Executive Committee and the ofApril 6th, "Diabetes Mellitus," Dr. Henry Rawle Geyelin, 103 East 78th Street, New York City April 13th, "Asthma," Dr. Robert A. CANCER CONTROL IN PHILADELPHIA

This Journal has received the following information regarding a course of instruction on the subject of cancer to be given under the auspices of the Medical Society of the County of Philadelphia, Pennsylvania

"At the request of the Pennsylvania State Commission on Cancer, The Philadelphia County Medical Society, through its Committee on Cancer Control is arranging a special intensive course for the study of Cancer, on May 22d, 23d, and

NEWS NOTES

ATTRACTIVE PROGRAM FOR ANNUAL MEETING

The activities of the Committee on Scientific Work have resulted in an unusually attractive program for the Annual Meeting of the Medical Society of the State of New York, which will be held in Albany beginning May The final protwenty-second of this year gram is almost complete and covers a wide

range of interesting subjects

In addition to the physicians from New York State who will participate in the program, a number of other states will be represented Papers will be presented and discussed by Dr Frederic C Irving, Dr Frances M Rackerman, Dr Chester M Jones, Dr Howard Root and Dr Charles L Scudder, of Boston, Massachusetts, by Dr Harold Cushing, of McGill University, Montreal, Canada, by 'Dr Fred D Weidman, Dr T Grier Miller and Dr Gabriel Tucker, of Philadelphia, Pennsylvania, by Dr E Cowles Andrus, of Baltimore, Maryland, by Dr Harold N Cole, of Cleveland, Ohio, by Dr Joseph C Beck, of Chicago, Illinois, by Dr Emory Hill, of Richmond, Virginia, and by Dr William L Benedict, of the Mayo Clinic, Rochester, Minnesota

The last day of the meeting will be devoted almost exclusively to a Cardiac Exhibit, which has been planned to illustrate both the public health factors and the scientific features in the study of heart disease. It is particularly appropriate that the Exhibit has been arranged for this meeting, when the final report of the Special Committee for the Study of Heart Disease in New York State will be presented to It should be especially attractive the Society to the members of the organization for the reason that it will serve in some measure to emphasize the unexpected findings of this Committee in an investigation which has cov-

ered every county of the State

Charts will be on exhibition displaying statistical data and other features in mortality.

morbidity, etiology, diagnosis, organized care and therapy The effect of disease on the heart will be demonstrated by X-ray photographs, electrocardiograms, drawings and paintings Not the least important part of the wall panorama will be the charts which will illustrate the problems of heart disease within our own state The pathological demonstration has been arranged on an etiological basis and will consist of about 140 gross specimens and some 40 microscopic specimens The latter will be shown by means of photomicrographs It is planned to have a lantern slide demonstration of the coronary circulation and of the microscopic lesions of the heart and blood vessels in rheumatic fever. The moving picture program will show studies of heart block, the heart valves in action and various tissues actually growing in culture media outside the human body

Two other noteworthy features will be the meeting of the Society on Tuesday evening, May twenty-second, which will be presided over by the President and at which several eminent speakers in addition to the President will address the membership, and a Joint Meeting of all the Sections, which will be held on Wednesday evening, May twenty-third, for the consideration of extra-scientific problems affecting the medical profession feature has never been attempted before and the Committee on Scientific Work believes that it will be a great attraction. This meeting will be presided over by the President, and the following topics will be presented Cost of Medical Care or Hospitalization of Middle Class Economic Group, Medical Aspects of Workmen's Compensation, Morals of Medicine, Present Status of the Practice of Medicine, Future of the Practice of Medicine

SAMUEL J KOPETZKY, Chairman, Comunttee on Šcientific Work

COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

Arrangements for the following courses have been announced by Dr Thomas P Farmer, Chairman of the Committee on Public Health and Medical Education of the Medical Society of the State of New York

A course will be given in Albany and Schenectady on six Fridays beginning April sixth,

under the auspices of the Medical Societies of the two counties The lectures will be given in Albany at 4 30 o'clock and repeated in Schenectady at 8 o'clock The lectures have been arranged by Dr Walter W Palmer, of the College of Physicians and Surgeons, New York City, and are as follows

dents or whose faculty may enjoy the privilege of practice or even of observation in any worthy hospital

10 There is not one of these schools that does not proceed on the basis of unproved theory, ignoring the lack of endorsement by all worthy educational institutions

11 There is not one of these schools that does not ignore or even avowedly oppose the scientific point of view and the facts of medical science accepted by the authorities of the entire civilized world

12 There is not one of these schools that does not owe its existence to the fact that it offers a short-cut to the practice of medicine.

The following is a list of the schools of chiropractic and naturopathy in the United States

California

Borkeley

Berkeley Chiropractic College, 2168 Shattuck Ave.

Los Angeles

Gale College of Chiropractic, 1406 W 7th Street.

Los Angeles College of Chiropractic, 918-20 W

Portland

Pacific Chiropractic College, Inc., 125 N Grand Avenue.

Pennsylvania

Philadelphia

Doughty-Marsh College of Chiropractic, 4201 Walnut Street.

National Chiropractic College, 2324 Columbia Avenue.

Pittsburgh

Universal Chiropractic College, 1940 Fifth Avenue.

24th, for all physicians who are interested Sessions are to be held morning, afternoon and evening

The mornings are to be devoted to special clinical demonstrations upon Diagnosis, Treatment and Results, in the centrally located teaching hospitals of Philadelphia

A special free buffet luncheon is to be served to the physicians who register for this course, so as to conserve time and prevent scattering Details of the program will be published in the near future

The registration fee will be \$500

Please register at once with Franklin M Crispin, Executive Secretary, The Philadelphia County Medical Society, S E Corner 21st and Spruce Streets, Philadelphia, so that satisfactory arrangements may be made"

HENRY G MUNSON, MD, Secretary

SCHOOLS OF CHIROPRACTIC AND NATUROPATHY

The American Medical Association, through Dr N P Colwell, Secretary of the Council on Medical Education and Hospitals, has sent out a letter of information regarding its inspection of schools that teach chiropractic, naturopathy, and other cults The following extracts of the letter will be of interest to physicians of New York State—Editorial note

Chiropractic has had, during its brief career of thirty-two years, about one hundred and fifty schools. Forty of these are still active, many of them offering courses at night only and having a mere handful of students, more than half of the forty are so poorly housed and so inadequately financed that their future is problematic. B. J. Palmer, the "developer" of the cult, recently said "According to our records, forty-eight chiropractic schools have closed their doors during the past two years"

While a venerable old age is claimed for naturopathy, its development has really been more recent than that of chiropractic, its chief exponent, Benedict Lust of New York, claims that he organized the "parent school" in 1896, but even so ancient an origin as that is improbable

The cult seems to have no basic idea, but to be rather a nature-cure hodge-podge with a decided antipathy to drugs. In fact, naturopathy has developed in part as an effort to broaden the scope of chiropractic. There are about five schools of naturopathy and all of them teach chiropractic. Several of the chiropractic schools teach naturopathy. Probably fifty or even seventy-five per cent of the practicing naturopaths have been recruited from the ranks of chiropractic, and the two cults have always been on the friendliest terms. The chiropractor may easily become a naturopath by taking a three-month "post-graduate" course in one of the naturopathic schools.

The subjects taught in naturopathy schools include sysmotherapy, glucokinesis, zone therapy, physicultopathy, astrological diagnosis, practical sphincterology, phrenological physiology, spectrochrome therapy, iridiagnosis, chiropractic, diet, hydrotherapy, osteopathy, physiotherapy, electrotherapy, mechanotherapy, heliotherapy, tension-therapy, naprapathy, neuropathy, physical culture, and many others.

The equipment in these schools differ little (if at all) from that found in schools of chiropractic, except that a small amount of electrical apparatus is usually found, and adjusting tables are not quite so much in evidence. A small chemistry laboratory is usual, that of the "parent school" in New York has room for two or possibly three students, but has not sufficient equipment for so large a number to perform the same experiments at the same time. There are no laboratories for physics, physiology, physiological chemistry, anatomy, bacteriology, histology, embryology, or pathology.

To one who is familiar with the elaborate equipment and curriculum found necessary to proper training in the science and art of healing today, the most impressive thing about these naturopathic and chiropractic schools is not what they are, but what they are not.

1 Of the fifty active schools listed, a few are mere "branches" rather than separately existing institutions, and these fifty constitute less than one-third of the number formerly existing

2 All but a mere handful of these fifty existing schools are so poorly housed and so madequately financed that their continuation is problematic.

3 Very few of these schools have even one adequately trained teacher on the faculty, and there are probably less than five expert all-time teachers in the entire lot of fifty institutions

4 Not one of these schools actually enforces a matriculation requirement of even five minutes of high school study

5 Not one of the fifty schools give so much as one worthy laboratory course or has one worthily equipped laboratory

6 Not one of these schools conducts a clime in which a wide variety of the common diseases may be studied

7 There is not one clinic equipped with the trained personnel or the scientific apparatus for the clinical diagnosis of a variety of the common diseases, nor having a laboratory equipped for checking such clinical diagnoses

8 There is not one clinic equipped for the proper treatment of patients suffering from such diseases

9 There is not one of these schools whose stu-

four calendar months, pay \$500 and get a diploma "recognized in all states except New Jersey"

Posted on the bulletin board of this one-room school, the inspector saw a list of last year's sixty-seven students, with a record of their absences by months. The highest number of absences recorded against any one student in any one month was 20 (four weeks of five school Nine of these 20's were counted There were several 16's and 14's, a large number of 15's and 12's, and the 10's were so numerous that it is surprising that even a chiropractic school would tolerate them for so modest a tuition fee Smaller numbers filled most of the remaining squares in this chart of absences short, about half of the school of sixty-seven miss half or more of the class sessions during from one to several months of the year Only eight of the sixty-seven failed to indulge in such

The American College of Chiropractors (Waldorf-Astoria, New York) has recently listed this school as "class A" and awarded it a "diploma of honor" more than two feet square. Indeed it has honored three of the four New York schools, and has done so without inspections and without a check-up of representations made by the schools

5 American School of Naturopathy This school, known also as the American School of Chiropractic, offers a night course in an old apartment house at 236 East 35th Street It is "the parent school of naturopathy," run by Benedict Lust There were twenty students in November, and there were fifteen graduates last year Catalogues are said to be too expensive, but an undated leaflet was published sometime ago offering a thirty-six month course (evenings) in "chiropractic, diet, hydrotherapy, osteopathy, physio-

therapy, electrotherapy, mechanotherapy, heliotherapy, etc"

There are five on the faculty The school has a chemistry laboratory large enough for two or three students but not equipped for so many There are no other laboratories unless it be one for dissection which is seldom ever used. There is no hospital. Instruction is didactic and to a very meagre extent clinical. Students without high school training finish this night course and go out to practice in the almost unlimited field of drugless therapy.

General Discussion In these five schools there is no educational standard and no adequate instruction There is no worthy equipment and no money with which to buy-no intention to buy and no faculty qualified to use it One school "Fully equipped, clinical, chemical, X-ray, pathological and research laboratories" There is not a chiropractic or naturopathic school in New York, nor anywhere else, of which even half of such a statement is true. The equipment of these schools consists of a few adjusting tables. some students' chairs, and a desk or two, with occasionally a small and almost entirely un-There are no equipped' chemical laboratory laboratories for physics, physiology, physiological chemistry, anatomy, histology, bacteriology, or pathology

The schools usually live but a short time and move often, taking advantage of cheap rent. They claim as much and give as little as possible Their faculties are uneducated, their clinics are small and made up of patients suffering from sublications rather than diseases, and their therapeutic procedures are based on a ridiculous theory bolstered by a money-lust and the zeal that usually accompanies ignorance. To state that such schools are unworthy is to state a truth too obvi-

DUTCHESS-PUTNAM MEDICAL SOCIETY

ous to be interesting

A happy event in the history of the Dutchess-Putnam Medical Society was the dinner given by the society to Dr John Henry Cotter of Poughkeepsie, in commemoration of his half century of the practice of medicine Dr Cotter graduated from the Albany Medical College in 1878 and has been prominent in medical circles of Poughkeepsie nearly all his life

The program stated that the object of the dinner was to felicitate Dr Cotter, and the after-dinner speaking consisted of expressing the sociability and good fellowship of the man, rather than the more serious aspects of his impersonal medical practice. After all the highest gratification which a half century of medical practice can bring to a doctor is the pursonal goodwill and esteem of his fellow practitioners. The speakers carried out the spirit as well as the letter of the following program.

Toasimaster
H ST JOHN WILLIAMS, MD,
President of the Dutchess-Putnam Medical Society
'Kindly refrain from any personal remarks"

Paper—"The Surgeon's Idea of a Family Doctor,"

JAMES E SADLIER, M.D.

The A M A letter included detailed reports on the five schools located in New York State, as follows

There are four schools of chiropractic and one school of naturopathy (in which chiropractic is included) in the State of New York All of these are located in New York City

This school 1 Carver Chiropractic Institute is in the Masonic Building at 71 W Twenty-third Street, and it had fifteen students in November There were five graduates last year, but lack of funds forbade the holding of graduation exer-For the same reason there is no recent catalogue, and it is highly probable that the school will soon close

The faculty consists of five members, and they

ofter a twenty-four-month course, stressing "the Carver System" High school graduation is not required of matriculants No laboratory work is offered. No hospital experience is arranged The students listen to lectures, "adjust" a few clinic patients, receive a doctor's degree and go out to establish a practice.

2 Columbia Institute of Chiropractic school occupies an old apartment house at 111 West 83d Street It represents all that survives of the Advanced School of Chiropractic and the International College of Chiropractic—a total of "fifteen or eighteen" students in November Last

year there were twenty-three graduates

There are seven on the faculty and they teach "only straight chiropractic" The dean is "Major Dent Atkinson, AB, PhB, DD, LLB, DC, Ph C" The professor of chemistry claims a B S degree Other faculty members claim only chiro No new catalogue practic educational honors was published this year, but the curriculum has been recently revised to cover twenty-eight months and 3528 class-hours (forty-five minute periods) "to meet the requirements of all chiropractic state boards"

A high school education is not required of matriculants There is probably a small chemis try laboratory, but no others There are no hos-Students are lectured to and pital facilities given a few patients to adjust, after which they receive a doctor's degree and are ready for a

practice

3 New York Eastern Institute of Chiropractic This school is (as its name indicates), a recent combination of the Eastern Chiropractic Institute and the New York School of Chiropractic, and it occupies an old apartment house at 124 West 74th Street The enrollment was said in November to be about 100 students, and the two schools claimed about 60 graduates last year

The combined faculty is said to have 14 members, but there is no catalogue, and no faculty list nor description of courses offered is available. High School study is not required of matricu-There is only one laboratory, this is for chemistry, but is equipped for only the very simplest tests, and is too small and too dark to be used more than for an occasional test on some clinic patient's specimens A physiotherapy department is said to exist but to be entirely separate from the school of chiropractic Students are lectured to, no hospital facilities are taught how to "adjust" patients, are given a doctor's degree and sent out to establish practices

4 Standard School of Chiropractic school is in an old stone house at 44 Fifth Ave-The light is poor and the atmosphere de-There were thirty-five students in Nopressing vember, and there were twenty-three graduates There is a faculty of six, but there is last year no recent list of faculty members or of courses A student without a high school education may enter any time, "do time" for twenty-

THE DAILY PRESS

VIVISECTION AND DOGS

Dog fanciers would not seem to be among those who treat dogs with such cruelty that legislation on the subject has been found necessary even in England Anti-vivisectionists would do well to read the following editorial from the New York Herald-Tribune of February 27

"It is difficult to understand how any friend of dogs can oppose the bill now in the Legislature which forbids the exhibition of dogs whose ears have been cropped Yet the bill was fought savagely while it was on its way through the Assembly and every possible obstacle is being placed in its way in the Senate, where it is now on third reading. Efforts are being made to persuade the Governor, himself an owner and admirer of dogs, to veto it, should it pass. The operation by which the ears of show animals are "shaped' must be done early in puppyhood and is brutally cruel The results are satisfactory only to people who believe that in some way this mutilation renders their pets smarter looking, or to dealers who find that there is more market for cropeared dogs than for those that are left as nature intended them to be

"In England ear cropping has been forbidden by law for more than fifty years, yet dog shows are as common and as popular as they are on this side of the water Repeated efforts on the part of the real friends of dogs have been put forth to persuade kennel clubs to dispense with the practice, but they have failed It was for this reason that the Legislature was appealed to The bill deserves and will receive the support of all real friends of ani-In its present form, it applies only to exhibition dogs. But its supporters are very much in earnest and have received so much support in the Legislature thus far that they believe if the bill fails of final passage, or is vetoed, it will be possible next year to have a more drastic bill passed, which will forbid,

on the grounds of needless cruelty, the mutilation of puppies, whether they are intended for exhibition or not

The Sun Dial column of the New York Sun of February 20 has this description of a human

show conducted by dogs

"St Bernard Line 'em up! Get that stringy-looking man moving! Make it snappy! I've got over one hundred of you human beings to judge before 5 o'clock. You boys look at their legs and bodies and I'll take care of their heads. They're a scrubby looking bunch of people. I don't see a real ribbon winner in the crowd.

"Great Dane (taking a squat, short-legged man, about 40, by the neck and setting him on a table) A fine looking mutt Teeth very bad! I don't think he's got any right in this class

"St Bernard (pulling at the man's ears and sticking a paw in his eyes) Got one of the worst heads I ever saw! Ears should be cut! They're too big No class to 'em

"Peke And his eyes are all watery Distemper, maybe He looks to me like he was nearly blind

"Boston Bull (pulling back the lids of the man's eves and peering intently) He can see I guess but you'd never think it

"Great Dane Look at the way he holds his head! No pep, no class

"St Bernard Give his neck a yank

'Great Dane (taking hold of man under the chin and giving a sharp tug) No matter what I do to this one he looks awful. Throw him out!

"Great Dane A fine kind of human being he is to be entered in a big show like this!

"Boston Bull Throw him back into the kennel He's a disgrace to the human race

"Great Dane (disgustedly) What's the matter with this year's human beings anyhow? I ain't seen a good one today!"

A SIMPLIFIED CALENDAR

There is probably no subject which does not have some direct interest to physicians. The calendar would seem to be of no concern to the busy doctor whose patients have no regard for his time and seasons, yet Mr. George Eastman of Rochester has sent out a news release on the simplified calendar as related to vital

statistics—a subject in which all physicians are interested. The article says

"From a collection of 185 calendar suggestions, from 38 nations, investigated by the League of Nations' Committee of Inquiry, there emerged two proposals. One would modify the present calendar but still keep the

MEDICAL WARES

TABLET TRITURATES

When the preceptorial system of medical teaching was in vogue, an important duty of the apprentice was to make the pills which his master prescribed. Every physician had his own "doctor shop," or, drug store, over which his assistant presided. Pills were made by crude methods by rules of thumb, and a stock rainy day joke was to have the green assistant make a supply of pills of reduced iron. But at the end, when the assistant came to look at his pills laid neatly in a row to dry, he found little heaps of powder instead of firm pills.

The modern drug manufacturers avoid pills on account of their uncertain hardness, solubility, and keeping qualities. Tablet triturates have taken the place of the ancient pills. The manufacture of a tablet triturate is now a scientific process in which the formulas and the methods are accurately adjusted and controlled in order to secure a product which is not only uniform at the time of making, but remains uniform under conditions of time, climate, and transportation

The first process in the manufacture of tablet triturates is that of weighing and mixing the materials. There is nothing peculiar about these processes except that they are done by expert chemists of proved reliability and accuracy.

The next process is that of granulating the mass. If a fine powder is compressed, its particles will not cohere. A tablet made of ordinary milk sugar, for example, would fall apart, no matter how firmly it was compressed, but one made of granulated milk sugar will be stable, because its coarser particles will interlock under the pressure.

The mixture of which triturates are to be made is moistened with a solution containing mucilaginous constituents, or glyceride of starch, or other suitable binder, and the combination is thoroughly mingled in a machine, forced through a sieve, spread on racks to dry, and if necessary is ground to a coarse powder whose particles will interlock when they are firmly compressed

The last step in making a tablet triturate is the compression of the material into tablets of a uniform size, shape, and consistency. The essential part of a tablet making machine is a flat steel plate one or two feet in diameter, containing a circle of holes each the size of a tablet. A similar plate above bears plungers which are operated downward by a cam wheel, while another plate below carries plungers which move upward.

The powder is fed upon the plate that contains the holes, and as that plate revolves synchronously

with the two bearing the plungers, the material in the holes is compressed with great force. The upper plungers rise first and the lower plungers continue their upward course and so eject the finished tablet. The process is automatic and continuous, and tablets emerge from the machine at the rate of five or ten per second. The proper adjustment of the plungers of the compressors is one of the finer points on which the perfection of the tablet depends. A pressure too great makes the tablet too hard, while a pressure too small makes a soft tablet which will not stand transportation.

The process of making a tablet may end with its compression, but the manufacturer may coat the tablet with sugar or other material by placing a batch in a revolving drum, pouring over it a small amount of the liquid coating. The revolution of the drum spreads the coating evenly while a blast of hot air quickly dries the tablets.

A standard test of a tablet is the rapidity of its disintegration in water. The physician expects a tablet to resist disintegration during a length of time sufficient for the patient to hold it in the mouth until he can take a swallow of water—and this may be a matter of some fifteen seconds with a slow patient. Yet the tablet must quickly go into solution in the stomach.

The physician may test a tablet, aspirin for example, by placing it in a glass of water. It will swell up and fall to pieces in a powder, yet it will not go into solution because aspirin is insoluble in water. The tablet disintegrates because a small amount of starch is incorporated with its material. The starch absorbs water and swells, thereby forcing the mass apart. The standard time of disintegration is from fifteen to sixty seconds.

Starch cannot be used in hypodermic tablets, because it is insoluble. Hypodermic tablets are made with sugar of milk only, and their stability depends on the pressure to which they are subjected during manufacture. Hence machine made tablets are more reliable than hand made tablets

as a general rule

A physician is likely to be disappointed in expecting a tablet to fulfil every possible condition to which he may subject it. He requires a firm tablet for his traveling bag in order that it may withstand the agitation of transportation, and at the same time he expects it to disintegrate quickly when swallowed. If a doctor specifies his needs, he can obtain a reliable tablet which is suited to his peculiar requirements.

BOOK REVIEWS

EVERYWOMAN A NURSE. Health and Nursing Notes for the Use of Nursing Societies, Technical School Classes, Red Cross and Ambulance Associations, etc., and in the Home. By Edith Newsome, S.R.N., 12mo of 204 pages, illustrated London and New York, Oxford University Press, 1927 Cloth, \$1.25

This should prove a useful small book for those untrained persons who wish to acquire some knowledge of matters connected with nursing. It is a revision of the author's book "Home Nursing" with additional chap-There are many people who are forced to nurse members of their families as best they can and these can acquire considerable information from this book.

Practically the whole field of nursing is touched upon and there are notes upon diets, hygiene, simple remedies and first aid W E McC.

GONOCOCCAL INFECTION IN THE MALE. By ABR. L. WOL-BARST, M.D. Octavo of 237 pages, with 89 illustrations St. Louis, The C. V. Mosby Company, 1927 Cloth, \$5 50

This book of two hundred and thirty-seven pages is devoted to the diagnosis and treatment of Gonorrhea and its complications. In the diagnosis of chronic Gonor-rhea the doctor has described the various urine glass tests, including the Wolbarst five glass test, which he uses to determine the source of pus and shreds in the urine. With the exception of the two and three glass tests, the other glass tests are but rarely used among urologists

Dr Wolbarst has used within recent years neoreargon, made in Czechoslovakia, a new silver salt which apparently possesses a marked superiority over its predecessors in penetrating power, germicidal action and harmlessness to living tissue. The reviewer has had no experience with this page calls and perience with this new silver salt

The chapter on the application of diathermy in Gonococcal infection is abstracted in part from "Diathermy" by Corbus and O'Connor This method of treatment is mainly being used in the complications of Gonorrhea and has not acquired widespread favor in the treatment of non-complicated cases because of the technical difficulties involved.

There is a chapter by J. E. R. McDonogh, F.R.C.S, the distinguished English surgeon, in which he gives his unique views on Gonorrhea.

This book will be found of decided advantage to the general practitioner as an aid in the diagnosis and treatment of Gonorrhea in the male.

PHILIP GOLDFADER

THE EAR, NOSE AND THROAT IN GENERAL PRACTICE.
An Informal Guide to the Main Principles By D A.
CROW, M B, Ch B Octavo of 150 pages, illustrated.
London and New York, Oxford University Press,
1927 Cloth \$325 (Oxford Medical Publications)

It can truly be said that this small volume is one of the best guides which is replete with the main principles of this specialty as met by the general practitioner The author spent over ten years in general practice, and the content of this book reflects his experience and mature judgment

A great deal of emphasis is placed on the acute ear A great dear Much stress is laid on the operation of and its sequence as a procedure to be carried out by the paracentesis as a processing to be carried out by the general practitioner who first sees the patient, thus helping to reduce the incidence of deafness.

The exclusion of difficult technical procedures found in the main text of similar treatises is to be commended Their performance should be left to the trained men.

There are many pencil drawings and photographs used to illustrate the text.

The author presents his subject in a style which is simple and impressive, and the salient points are brought home in a unique manner such as is seldom found in medical text.

It would not be possible to recommend a better book for the physician engaged in general practice.

BENJAMIN H ABRAHAMS

THE DIAGNOSIS OF PANCREATIC DISEASE. By ROBERT COOPE, M D 12mo of 112 pages London and New York, Oxford University Press, 1927 Cloth, \$1.50 (Oxford Medical Publications)

Pancreatic disease and function, and tests for pancreatic function are considered in this polished essay. The literature is thoroughly surveyed and the point is made that where so many tests, chemical and otherwise, have been advanced for pancreatic-function, so few are rehable. Among dependable tests are emphasized creatorrhoea (presence of striated muscle fibre in the faeces) and the test for lipase in the duodenal contents - The latter is an ingenious test by Carnot and Mauban involving the reduction of a neutral fat on an agar medium and then tested with CUSO

It is a compact review written with much style. HENRY F KRAMER

REBUILDING THE CHILD A Study in Malnutrition By Frank Howard Richardson, A.B., M.D., 12mo of 319 pages, illustrated New York, G. P. Putnam's Sons, 1927 Cloth, \$2.00

Written in great earnestness, showing in every line the stroke of experience.

Every chapter is replete with practical and helpful suggestions to both parent as well as Doctor

The subject of Malnutrition as well as the Nutrition class is presented in a very desirable and instructive manner. The paper on "What the child should demand of his Doctor"-in the appendix-is most highly recommended to all interested in child welfare,

HARRY APFEL

EDITORIAL SILENCE. The Third Era in Journalism By ROBERT T MORRIS 12mo of 256 pages Boston, Mass, The Stratford Company, 1927 Cloth, \$2 50

Here is a curiously written and not too well proofread book devoted to telling why new spaper editors do not see the news in the thrilling happenings of every-day life. The case illustrations are drawn from the "yellow" telling of murder, banditry and other crimes in great detail and contrasted to the silence with regard to horticulture, scientific advances and the romance of daily life as it occurs all about us

Editors are all wrong in their knowledge of what the public wants and the author is sure he is all right. The point he tries to make is a correct one in the reviewer's position but the 122 pages of prologue and 53 pages of postlogue were hard reading. They gave us nothing new nor, do we believe, convincing to editor or layman—if anyone but a reviewer could read or would read it through.

shifting dates The other establishes 13 months of 28 days each, this is known as the International Fixed Calendar, every month of which is shown thus

EVERY MONTH FOUR WEEKS

Sun	Mon	Tues	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28

"The thirteen months of 28 days plan, originated by Moses B Cotsworth, a British scientist, and supported by George Eastman as its leading advocate, provides for a new month, "Sol" to be inserted between June and July, for an extra Sabbath—the 365th day of the year—to be observed as December 29, Leap Day once in four years to be observed as June 29

"The League of Nations, after three years' research, has requested all nations, including our own through the Secretary of State, to form national committees to consider calendar revision. The Department of State has just canvassed our Government departments on

the question with the result that practically all are favorable. The Chamber of Commerce of the United States, on the recommendations of its Board of Directors and National Councilors, has just formed a special committee of eleven men to investigate the subject and report. An International Conference, similar to the one held in this country which established Standard Time, will eventually be called by international agreement to consider the equalization of the months to be universally adopted

"In some places health statistics are recorded in monthly totals and for ten-day periods, the effect is that Saturday's records are for one-half day, and Monday's for a day and one-half With the days of the week shifting and the number of Sundays shifting, the totals are misleading, varying up to 15 per cent from the truth Even though diseases, births, and deaths decreased, this might not be shown in the comparisons published

"Dependable health records are essential alike for current and permanent use From the scientific point of view the adoption of the simplified calendar of thirteen months of 28 days would help to relieve the twilight in which scientific authority now finds itself in the pursuance of its researches

COSMIC RAYS

The daily newspapers have recently carried news items regarding the Millikan rays, so called from their discoverer and investigator These are rays with extremely short vibrations—shorter even than the X-rays They seem to pervade all space even the depths of the sea, and they penetrate matter even more readily than do the X-rays Their presence has been shown by the discharge of electroscopes, and now Professor Millikan has demonstrated their spectroscopic qualities

The rays have a direct relation to the Einstein theory, which deals with the effects of gravitation on masses infinitely large and infinitely small. The theory is called that of relativity, which simply means the relation of the thing measured to the unit of measurement. There is no actual unit for measuring either the infinitely large or the infinitely small, but the branch of higher mathematics called calculus deals with both of these conditions. Calculus is so abstruse that few college students attain to an understanding of its simplest elements, yet the higher calculus into whose infinities Einstein delves is as far above the brain of the college student as the mathe-

matical ability of the student is above that of the first grade child Probably only two or three persons in the world can follow Emstein's mathematical reasoning, and yet he has calculated the energy which would be liberated if hydrogen were transmuted into helium

It is at this point that the Millikan rays are of popular interest. When the transmutation of hydrogen into helium occurs, 08 per cent of the hydrogen mass disappears in the form of the Millikan cosmic rays. The theory is that the transmutation is constantly occurring in the stars which are thus the source of the Millikan rays. Moreover, the observed measurements of the rays agrees closely with the measurements predicted by Einstein by mathematical reasoning.

An editorial on the cosmic rays in the New York Times of March 20, ends as follows

"Thus are the daring conclusions of the mathematical astrophysicist experimentally justified. And that seemingly mad world of Einstein, in which space is curved, light comes by the pound, and matter and energy are convertible into each other, becomes very real."

The Spirella Maternity

A HYGIENIC garment designed along anatomical lines on the principle of the sling support

With the weight borne by the broad, strong muscles of the back and the bony structure, rather than centered at any one point

The flexible, resilient Spirella Stay permits this anatomical design

The control and support features through the design adapt to the changing physical conditions during the entire period of pregnancy

The Spirella Maternity Brassiere completes the Spirella Service

It is the Spirella Policy to aid the Physician in bringing to every child its birthright—Health, A Normal Start in Life

Instructions for taking measurements can be given which will enable the physician or expectant mother to order the Spirella Maternity by mail—In large cities Spirella is organized to give residence service through a trained representative—Further information upon request

OUR NEIGHBORS

DIAGNOSIS OF LUNG TUBERCULOSIS

The campaign of the National Tuberculosis Association for the early diagnosis of tuberculosis has elicited responsive articles in the State Medical Journals The IVisconsin Medical Journal of March contains the following practical article by Dr Oscar Lotz, of Milwaukee—Editor's note

A—HISTORY B—PHYSICAL EXAMINATION C—LABORATORY AIDS

A —HISTORY

A carefully taken, searching history gives one an understanding of the general outline of the case and means diagnosis and prognosis partly made. It must be full and complete, for the beginnings of tuberculosis are involved in all that the patient has ever been or done.

A Family History—Thirty years ago the family history was important because of our belief in heredity, today it is important because of our knowledge concerning contact Associates, housing, home conditions, work, recreation, sleep, wages, and temperament, may act as predisposing causes to the development of tuberculosis

B Previous Medical History—Acute respiratory diseases, grippe, influenza, pleurisy, nervous breakdown, typhoid-pneumonia, are often but the beginning of tuberculosis. In the majority of diseases the time of infection and the onset of symptoms are separated by a brief and fairly constant period, in tuberculosis this interval may be four days, four months, four years or forty years

C Present Illness — No pathognomonic symptoms, practically all symptoms and physical signs of tuberculosis may be present and yet leave us unable to make a positive diagnosis. There are, however, a number of symptoms, any one of which, if present, demands an especially careful examination of the

1 Hemorrhage — May be the end of the beginning or the beginning of the end Blood in the expectoration may be due to spongy gums, bad teeth, heart disease, pneumonia, influenza, syphilis, carcinoma, bronchiectasis or abscess, but the outstanding cause of a freak hemorrhage of a teaspoonful or more of blood, especially in the young, should mean a diagnosis of active pulmonary tuberculosis, until proven otherwise

2 Pleurisy —Yesterday pleurisy with effu-

sion meant suspicious tuberculosis, today it means presumptive tuberculosis, tomorrow recurrent dry pleurisy will perhaps be considered as tuberculous in etiology

3 Cough—Probably the most frequent symptom of pulmonary tuberculosis, yet the least characteristic. The cough in early tuberculosis is not a big cough. The fellow who is coughing his head off probably does not have tuberculosis, but the patient who clears his throat habitually and denies that he has a cough, is more likely a candidate for sanatorium treatment. Every cough that "hangs on" should be given the benefit of a good chest examination. A person may have tuberculosis without cough.

4 Fatigue—Playing out more easily than is usual for the individual, without a satisfac-

tory cause, is suggestive

5 Fistula in Ano—Very frequently forgotten by the patient when giving history Wherever there is a question of tuberculosis, ask about that boil near the rectum

6 Contact—Exposure to infection—one of the most important factors in the history Prolonged and intimate contact, especially during childhood, demands careful study And don't forget grandmother and grandfather, who may have had chronic bronchitis for years

B—Physical Examination Essential Factors

A Always—1 Strip patient to waist 2 Have patient face light 3 Compare corresponding areas of chest

B On inspection look for— 1 Retraction (usually means old lesion) 2 Diminished expansion—indicates extensive lesion or adhesions 3 Lagging—suggestive of active process

C To obtain best results from percussion—
1 Use firm pressure with finger between and parallel with ribs 2 Use light, short stroke 3 Percuss from below upward, especially posteriorly

D Auscultation—1 Is the most important procedure in the detection of abnormal physical signs 2 Characteristic localized rales are second in importance only to tubercle bacilli in the sputum 3 These rales are best elicited by having the patient breathe out completely, cough, and breathe in

(Continued on page 412-adv xvi)

The Spirella Maternity

A HYGIENIC garment designed along anatomical lines on the principle of the sling support

With the weight borne by the broad, strong muscles of the back and the bony structure, rather than centered at any one point

The flexible, resilient Spirella Stay permits this anatomical design

The control and support features through the design adapt to the changing physical conditions during the entire period of pregnancy

The Spirella Maternity Brassiere completes the Spirella Service

It is the Spirella Policy to aid the Physician in bringing to every child its birthright—Health, A Normal Start in Life

PHILLIPS Milk of Magnesia

THE IDEAL LAXATIVE-ANTACID

The name "PHILLIPS" identifies Genuine Milk of Magnesia It should be remembered because it symbolizes unvarying excellence and uniformity in quality

Supplied in 4 oz, 12 oz, and 3 pt Bottles

THE CHAS. H. PHILLIPS CHEMICAL CO.

New York and London

RADIUM HOSPITAL

BROOKLYN 784 CARROLL ST.

BROOKLYN, N. Y
TELEPHONE
NEVINS 7350

Adequate amounts of radium available for treatment of all benign and malignant conditions Patients referred can be treated either at this or other hospitals or at their homes Radium rental service, radium emanation, radium water and radium for intravenous injection

Co-operation with members of the medical profession desired

CHESTER FORD DURYEA, M.D. DIRECTOR

(Continued from page 410)

E These fine moist rales—1 Occur in showers at the beginning of inspiration 2.

Are localized to one or two areas 3 Are persistent and constant.

F And are most frequently heard in the—1
Supraspinous fossa 2 Supraclavicular
fossa 3 First interspace near sternum

G Remember that—1 Marginal rales heard at the bases in the avillary regions are coarser and can be dissipated by deep breathing 2 Lesions of the apices are usually tuberculous and lesions of the base alone are usually not tuberculous 3 If m doubt, have patient come back for repeated re-examinations. The better the diagnostician the less is he embarrassed by such necessity

C-LABORATORY AIDS

1 Sputum — Failure to find and correctly in terpret abnormal physical signs can be condoned, but failure to ask for and examine the sputum in any patient with chronic cough is inexcusable — Brown

One negative report means very little. In a recent report the fourteenth examination was the first to show tubercle bacilli

One fish caught proves fish in pond, one hundred failures does not prove no fish

2 Tuberculus Test—A positive tuberculus test means tuberculous infection, not tuberculous disease. A carefully done negative test means, with certain exceptions, no tuberculosis

Of especial value in children when the question of broncho-tracheal gland tuberculosis

3 Temperature and Pulse Record—Slight but persistent rise in temperature and increase in pulse rate indicates a toxemia. Early tuberculosis is not the only chronic toxemia, but it is one of the most common. Have your patient take his temperature at four-hour intervals for a week or two

4 X-ray—Should be stereoscopic and read by one with experience The X-ray film does not make a diagnosis of pulmonary tuberculosis but does act as a very valuable aid to history and physical txamination

No films are pathognomonic but some are reasonably characteristic and some suggestive of tuberculosis. The X-ray film does not show activity. Soft, woolly, snowflake-like densities indicate recent inflammatory processes, hard, clear-cut shadows represent older lesions.

THE FIRST OVARIOTOMY PATIENT

The Kentucky Medical Journal for March 1928, contains a Woman's Auxiliary department, in which Mrs A R. McCormack prints

(Continued on page 413-adv xvn)

(Continued from page 412)

the following data regarding the grave of the first ovariotomy patient based on information contained in the *Journal of the A M A*, January 4, 1913

The grave of Jane Crawford is located in the Johnson Cemetery, ten miles northwest of Sullivan, Indiana It is marked by a small marble slab bearing the following inscription

> Jane Crawford Died Mar 30, 1842 Aged 78 years

Blessed are the dead who die in the Lord
